high ground and well drained. Keep all manure heaps and straw stacks out of the hog lots for the same reasons. If possible change the pasturage frequently. Occasionally disinfect the sleeping quarters with a three per cent solution of some coal tar dip.—A. R. Hahner, Veterinarian, Idaho Agricultural College.

FAT AND LEAN

In the busy world of dairying even a few meager calculations show great differences, whether in cows, their owners, the land, the bank deposits or the test of fat, etc.; fat and lean are mixed, good results and poor, even on adjoining farms, even in two stalls in the one stable. One owner gets perhaps 200 pounds of milk from each lean, hungry acre; a neighbor with better methods produces the fat total of 1700 pounds of milk per acre, keeping 16 good cows on a well tilled 80-acre farm. One milk producer, with poor grade cows never tested, possibly never well fed, gets the lean average of less than 3000 pounds of milk per cow; another producer, who is a real dairyman, revels in the knowledge of each of his 16 cows giving over 8000 pounds of milk that will test fairly rich in fat.

Then when it comes to feeding for profit, not simply for existence, we find one man with 100 pounds of milk costing him only 59 cents for feed, but a neighbor has to admit the impeachment of milk costing him per hundred at least 90 cents, perhaps over a dollar. So one will make the fat profit above feed of over $30 per cow, while his neighbor is down to the lean margin of only $3.00. Why do such amazing differences occur? Primarily because dairymen have not studied each cow individually. Dairy records alone can shed light on these problems.—C. F. W.

THE BROOD SOW

Pork producers are in a liquidating humor and are ready to respond to advances in price. The hog market still continues at a low ebb and the situation is aggravated by the top-heavy grain market. Professor William Hislop, animal husbandman of the Washington state experiment station, states that there is no need to be panicky and to sell when the market is in a semi-demoralized condition. To the world cataclysm now occurring in Europe may be attributed the sharp decline in hog stocks since October, 1914. Feast always follows famine, so it behooves those forward-looking hog growers, who have retained their breeding stock, to give them the best possible care in order that future production may not be so restricted as it would seem at this time.

The essentials of brood sow management may be briefly summarized:

Provide suitable food, but do not over-feed.

Emphasize the protein and ash constituents of the ration.

Keep the sow growing thriftily, but do not fatten.

Devise schemes to induce exercise.

Provide warm, dry, well bedded, well ventilated and sun-lit quarters.

Avoid constipation by natural feeding methods, but resort to emergency remedies if necessary.

Kill off lice with crude oil, and drive out worms with santonin and calomel.

Practice gentleness at all times.

Hog men can not afford to neglect any of these cardinal points when the cost of production is so high.

Within the next seven to nine weeks most of the brood sows and gilts will farrow. Our investigations tell us that 90 per cent of the dry matter in the unborn young of the sow and gilt is deposited in utero during the last sixty days of pregnancy. This being so it is wise to provide for the needs of the gilts and sows within this time by increasing their daily wintering rations from 50 to 75 per cent.

Rations Before Farrowing

Barley meal, 75 lbs.; chopped alfalfa hay, 15 lbs.; tankage, 10 lbs.; rutabagas or carrots.

Ground oats, 45 lbs.; barley meal, 45 lbs.; tankage, 10 lbs.; alfalfa hay in racks; rutabagas or carrots.

Ground oats, 50 lbs.; middlings, 50 lbs.; alfalfa hay or clover hay.

In the farrowing pen there should be a rail set eight inches from the floor and six inches to eight inches from the wall, to prevent the sow from crushing her pigs. Provide just a small amount of bedding for the sow to make her nest.

For a few hours after farrowing the sow needs no feed other than water which has been sufficiently warmed to remove the chill. After 18 to 24 hours she should have a warm feed of this shorts slop. After that time the feed should be gradually increased until she is receiving all she requires, but no more. Insist upon exercise.

Rations for Sows With Sucking Pigs

Barley, 30 lbs.; oats, 30 lbs.; middlings, 20 lbs.; bran, 12 lbs.; tankage, 8 lbs.

Barley, 50 lbs.; shorts, 20 lbs.; bran, 15 lbs.; oil meal, 10 lbs.; tankage, 5 lbs.

Ground oats, 50 lbs.; middlings, 50 lbs.; skim milk.

Provide early pasture for the sows and their young. Winter rye and rape are as good as alfalfa, and are ready when most required.

DAIRYING AND THE SOIL

The greatest advantage in dairy farming is its relation to the fertility of the soil. No other system of farming excels it in this respect, and but few equal it. A farm used for dairy purposes does not lose in fertility, but gains, and may be used for this purpose almost indefinitely.

When animals or milk products are sold off the farm, only a small portion of the fertility of the entire crop is sold, while the greater part of the fertilizing elements are returned to the soil in the form of barnyard manure. The fertilizing value of common grains as compared with the fertilizing value of the products of the dairy farm, figured at prices of commercial fertilizer, shows less decrease in fertility by dairy farming.

One ton of butter contains 50 cents worth of fertilizer constituents.

One ton of milk contains $2.09 worth of fertilizer constituents.

One ton of wheat contains $7.75 worth of fertilizer constituents.

One ton of oats contains $7.26 worth of fertilizer constituents.

One ton of corn contains $6.75 worth of fertilizer constituents.

One ton of clover hay contains $9.07 worth of fertilizer constituents.

One ton of alfalfa contains $9.50 worth of fertilizer constituents.

BUTTER SCORE ERROR

We regret very much an error which occurred in this department of the Cultivator of March 25th, on page 368. We gave the score secured by W. J. Grinsell of the Libby, McNeill and Libby Creamery at Loleta as 91. It should have been 93½. Mr. Grinsell writes:

"As your paper is no doubt read by thousands of interested dairymen we want them to know that butter made in Humboldt scores up with any other part of California."

We appreciate the correction sent by Mr. Grinsell and we sure wish to give good old Humboldt due credit for making first grade butter.

Nice Bossy--Father Says You're Giving an Awful Lot of Milk Now!

It is a common thing to hear cow owners express their enthusiasm for *Kow-Kure* after using it on sickly or "backward" cows; and no wonder. *Kow-Kure* has such a wonderful effect on the genital and digestive organs that many cow ailments commonly regarded as very serious can be prevented or promptly relieved by following the simple directions. If you have never used *Kow-Kure*, we want to send you our useful free treatise on cow diseases, "The Cow Doctor."

You can buy *Kow-Kure* in 50c or $1.00 packages from druggists and feed dealers.

Bees and Their Care

EASY TO HANDLE BEES WHEN YOU KNOW HOW

THE extension of bee culture as a means of adding to the income has been rapidly going on since it was demonstrated that bees could be managed without discomfort to the operator and that a profit of 50 per cent and even more was easily procurable.

Bee culture requires no outlay for land upon which to raise crops, for as yet there has been no plant discovered that pays to plant for honey alone.

The honey bee is a benefactor to our race, roaming the fields at will, gathering honey and pollen, which she pays for in the fertilization of the flowers.

She takes nothing from the fertility of the soil, but gives to it one of the greatest fertilizers known, the clover, which would become extinct if it were not for her agency in fertilizing the bloom. No land is required except a spot on which to place the hives.

It is easy to handle bees when you know how. Undoubtedly a beekeeper often gets stung; it would be useless to deny it, and it is scarcely consoling to a novice to tell him he will get used to being stung; but after a time a beekeeper really does become inoculated, after which, although the momentary pain may be sharp, there are no disagreeable after effects, such as swelling, etc.

The fear of stings, I think, prevents many from liking the work; and yet when properly protected with a bee-veil, and working only in the warm part of the day, and never when cloudy, rainy or cold, and with the use of a good smoker, one need rarely be stung.

In many cases the sting of a bee is attended with much pain and swelling, while in others there are no ill effects produced whatever, and there is no doubt but that the system may become inured to the poison so that no bad effects are produced.

The writer recollects the time when a bee sting was very painful to him and was always attended with suffering and swelling. I know there is a certain current impression to the effect that bees will sting some people more than others.

While this is true, it is not because they are able to recognize any peculiar physical condition or difference, nor is it because one person smells to the bees different from another. It is because they notice a difference in the behavior of different persons.

Avoid quick motions, do not breathe upon them and if there are other bees flying about in search of plunder do not leave the hive open too long.

In case of accident the smoker should be used freely, and it ought to be at hand for any manipulation in the apiary. It is much easier to prevent the anger of bees than to stop it after it has begun. If you mismanage a colony of bees and arouse their anger, it is quite likely that this disposition will remain with them for a few days.

A bee away from home or laden with honey never volunteers an attack. This is so well known and so established by apiarists that if I were not writing mainly for beginners I would not think of mentioning it.

Thus in order to render bees harmless it is only necessary to cause them to fill themselves with honey, and this is done by frightening them with smoke. When smoke is driven into a hive through the entrance, the bees at once begin filling themselves with honey.

But with them, as with human beings, it is the most experienced which are slowest to take fright, so when the old bees are all at home it is more difficult and takes more time to compel them all to fill themselves.

For this reason it is much safer to handle bees during the warmest part of the day, or at a time when the greater part of the old bees are in the field.

The bees which compose a swarm are usually filled with honey for the journey which they expect to take, and they are harmless unless crushed or very much irritated by the anger of others, and the smell of the poison.

It is not absolutely necessary to smoke the colony of bees until all the bees fill themselves with honey in order to handle them safely, but it is certainly the safest method.

An expert may open a hive without smoke and without danger and may handle the combs and return them to the hive without getting a single sting by being quiet, steady and fearless.

It is a fact that the fearless apiarist may often be entirely unharmed, while others a rod away may be stung by the very bees which his manipulations anger.

His quiet, determined demeanor is his safeguard, while the uninitiated strike at the angry bees until they are stung.

When you wish to open a hive of bees, if you wish to be perfectly safe, arm yourself with a smoker, cover your head with a veil, and step boldly to the front of the hive; send the smoke through the opening for half a minute, then stop and repeat the operation after another half minute, or until they make a steady hum, which will show that they have given up the desire to fight.

Then open the hive, smoke gently and you may lift the combs one after another.

Many people have kept bees but did not succeed on account of the wormmoth, but worms very rarely, if ever destroy a colony of bees in normal condition.—F. G. Herman in Gleanings.

HONEY GRADING

Rules adopted by the National Beekeepers' Association at Cincinnati February 13, 1915: Sections of comb honey are to be graded: First, as to finish; second, as to color of honey; and third, as to weight. The sections of honey in any given case to be so nearly alike in these respects that any section shall be representative of the contents of the case.

Finish

Extra Fancy—Sections to be evenly filled, comb firmly attached to the four sides, the sections to be free from propolis or other pronounced stain, combs and cappings white, and not more than six unsealed cells on either side.

Fancy—Sections to be evenly filled, comb firmly attached to the four sides, the sections free from propolis or other pronounced stain, comb and cappings white and not more than six unsealed cells on either side exclusive of the outside row.

No. 1—Sections to be evenly filled, comb firmly attached to the four sides, the sections free from propolis or other pronounced stain, comb and cappings white to slightly off color, and not more than 40 unsealed cells exclusive of the outside row.

No. 2—Comb not projecting beyond the box, attached to the sides not less than two-thirds of the way around and not more than 60 unsealed cells exclusive of the row adjacent to the box.

Color

On the basis of the honey, comb honey is to be classified as: First, white; second, light amber; third, amber; and fourth, dark.

Weight

Heavy—No section designated as heavy to weigh less than 14 ounces.

Medium—No section designated as medium to weigh less than 12 ounces.

Light—No section designated as light to weigh less than 10 ounces.

In describing honey, three words or symbols are to be used, the first being descriptive of the finish, the second of color and the third of weight. As for example; Fancy, white, heavy (F-W-H); No. 1, amber, medium (1-A-M), etc. In this way any of the possible combinations of finish, color and weight can be briefly described.

Cull Honey

Cull honey shall consist of the following: Honey packed in soiled second-hand cases or in badly stained or propolized sections; sections containing pollen, honey-dew honey, honey showing signs of granulation, poorly ripended, sour, or "weeping" honey; sections with comb projecting beyond the box or well attached to the box less than two-thirds the distance around its inner surface; sections with more than 60 unsealed cells, exclusive of the row adjacent to the box, leaking, injured, or patched up sections; sections weighing less than ten ounces.

Poultry for Profit

SOME FACTS ABOUT BLACKHEAD

Written for the California Cultivator
By Jean A. Koethen

TURKEYS ought to be more profitable in California than chickens or ducks. With our thousands of acres of dry hillside and our drier climate we have exactly the environment suited to turkeys, and there seems to be nothing lacking but the turkeys. Not that the turkeys are really lacking, either, for many thousands are raised and marketed at a profit every year, but every year thousands of little poults slip away from the hands that would most gladly feed them, and every year the wail goes up, as I heard it again and again from my neighbors last summer, "You can't raise turkeys." Well, I did raise nine out of eighteen hatched. Not a very good showing, but better than most folks do, and I am going to beat that this year.

Last year I stumbled, quite by accident, on one of the most important secrets of poult raising, and raised eiight out of ten of my second brood. Now I have been studying up the recent bulletins of the Rhode Island station, and they have not only confirmed me in my theory as to the secret of raising poults, but have given me a good deal of new light.

The Rhode Island station has done far more than any other experiment station in the investigation of blackhead. In fact it is as far as I know the only one that has given very much attention to this disease. It is commonly said, you know, that blackhead has killed off most of the turkeys of New England, so that the industry which was pointed to with pride a few years ago is no more. I had supposed till I read these bulletins that we had little, if any, blackhead on this coast, and that the disease that takes our young turkeys was a mysterious sort of "liver trouble." Since reading these I see no reason to doubt that the disease which has carried off my poults and those of my neighbors is the same disease which has decimated the flocks of the Atlantic coast. The name blackhead, which by the way is a misnomer for the heads of affected birds rarely turn black, has long been synonymous with "liver trouble," and the symptoms described in Bulletin 141 are precisely those of the disease which carried off my poults last year. "Blackhead," the bulletin says, "presents three symptoms which are invariable: first, diarrhoea at some stage of the disease; second a condition of increasing languor or stupor, together with isolation from companions in the flock; third loss of appetite and more or less prolonged emaciation."

Naturally the disease is most quickly fatal when it attacks very young birds. In these cases it appears within a few days after hatching as "white diarrhoea," and the poult dies after two or three days of stupor. So many more poults die at this age than later that it is often said that poults a month old are as good as raised. This is not true however for birds that are carelessly fed often develop the disease at two months or older. Between two and three months when they are feathering is rather a critical time in the life of poults. I lost two at this age last year with the same symptoms, a thin, yellowish diarrhoea, loss of appetite, with increasing stupor and emaciation. These birds lived a week or more, one of them I remember being almost a skeleton when it died.

According to Bulletin 141 the disease has also a chronic form which sometimes lasts for a year or more. Birds with this form of the disease often succumb when they are being fattened for market or when conditions are otherwise unfavorable. Besides the birds which are actually ill it sometimes happens that birds (they are more often chickens than turkeys) harbor the parasite which causes the disease, and without any sign of illness themselves scatter infection through their droppings. This is one of the most trying things about blackhead. You never know from what direction infection is coming.

But what is blackhead and why is it so particularly difficult to guard against? Here is the crux of the whole matter. It used to be supposed that the parasite which caused the disease was an amoeba, one of the lowest forms of animal life. Investigations at the Rhode Island station have proved that the parasite is not an amoeba, but a coccidium, and a coccidium, as is well known, is the same protozoan organism that causes a certain form of white diarrhoea in chicks, a disease called coccidiosis in goslings, and a similar disease which affects pigeons. In other words, instead of a special parasite which may be hunted down and destroyed by drugs or disinfectants, we have a parasite so generally distributed that detection is absolutely impossible. It may be harbored in the intestines of hens which are apparently perfectly healthy or scattered by pigeons, mice or even quail. In fact there is no knowing whether or not your premises are infected with these coccidia or any way of preventing infection for a moment, and these parasites while often harmless to fowls are death to turkeys.

Tells why chicks die
E. J. Reefer, the poultry expert of 905 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

L. A. CACTUS & STOCK RANCH
Room 605, 444 S. Broadway, Los Angeles

There you are! War with aeroplanes and biplanes is nothing compared to this coccidial infection.

But the Rhode Island station does not leave us here. After pointing out the utter impossibility of avoiding infection it gives one gleam of hope. These coccidia it seems may be taken into the intestines of the poult and still not be fatal if the bird is properly fed. In the words of Extension Bulletin No. 12, "The Feeding of Turkeys with special reference to Blackhead Disease," "One of the most important of the causes that predispose to blackhead is the clogging up of the alimentary tract, especially the ceca, with large amounts of hearty food materials. Such a condition, usually accompanied by malfermentations, lowers the resistance of the tissues and favors the development of the blackhead parasites which are always ready and waiting to begin their attack upon the inner walls of the intestines and ceca."

A PRACTICAL POULTRY BOOK

"Poultry for Profit" is a practical manual for the beginner, the farmer and the side-line poultryman, by Jean A. Koethen, published by the Cultivator Publishing Company, Los Angeles, at $1. Mrs. Koethen says in the opening sentences of the book: "This book is designed as a simple outline of the principles of poultry culture and a resume of the most up-to-date methods in use among practical poultrymen. There is no best method for any part of poultry work, but there are a few broad principles underlying all, which must be grasped by the learner who is seeking for best results."

During the past several months The Weekly Oregonian has printed many articles by Mrs. Koethen, all practical and of value. They have related her experiences and told of her experiments with fowls, and her advice to the men and women raising poultry on the farm has been of value to beginner and old hand. To be sure, her work has been in California, but a chicken is a chicken the world over, and her nature knows no boundary lines. The Weekly Oregonian takes pleasure in recommending this book to its readers, for it is "the right stuff," told in the right way by the right woman.—Portland Oregonian, of March 4, 1915.

Proper feeding according to this bulletin consists in feeding the proper amount of food and in feeding the right thing. This coincides absolutely with my experience last spring and is the "secret" I referred to. My first brood last spring was fed on the traditional hard-boiled egg and bread crumbs. It was placed before them, always with chopped green and grit mixed in, in a small dish, and they helped themselves ad libitum. In two weeks only two poults survived. The second brood was given five times a day a single teaspoon of the following mixture: I chopped together equal parts of young onion tops or lettuce and stale (very stale) cracked wheat bread, mixed one part of this with one part cottage cheese and added a pinch of grit, and after the first day a little sprinkling of steel-cut oats This made cottage cheese one-half and green stuff one-fourth of each meal. Listen to what Bulletin 12 has to say as to the amount fed to poults: "The advice has commonly been to give the young poults just as much as they

(Continued on Page 439)

250 Acres Near Sonoma City, large portion level (now in crop), balance rolling, fine pasture, some wood, well, never failing spring, etc. This is a particularly good location (42 miles from S. F.) for a whole milk dairy. Price, $13,500. Terms, $1,500 cash, balance in six years. R. C. Waller, 625 Market St., San Francisco.

California Land—Money making little farms, high class, low priced properties in all counties; first mortgage loan on farms bearing 7 to 9 per cent. Call or write the oldest land office in California. C. M. Wooster Co., 303 Phelan Bldg., San Francisco.

County Sectional Maps—Showing vacant government land, $2.50 any county. VERY PLAIN. Easy to see and select your choice. Booklet and circulars FREE. Write Joseph Clark, Searcher of State and U. S. Records, Sacramento.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—Orange, olive, peach and rice land. Close in, on good terms. Fred Hart, Exeter.

Free—Brand new list of Santa Cruz Ranch Bargains. Wilson Bros., Santa Cruz, Cal.

BEES AND HONEY

Beekeeping—Instruction book free—explains honey productions, profits, prices, supplies, bees and management without stings. Spencer Apiaries, Iris Avenue, Nordoff, Cal.

BLACKHEAD

(Continued from Page 437)

will clean up at one time. As a matter of fact this is entirely too much. It is very much better to find out how much the birds clean up and then plan to give them half this amount or even less. It can no longer be doubted that in blackhead of turkeys the causes which predispose to the disease are from one point of view more important than the actual existing causes in the form of the parasites themselves."

I have never succeeded in raising poults without cottage cheese, and here again I am supported by the bulletin which says:

"In the second place, without introducing all the evidence upon which the conclusion rests, it may be said that the presence of certain acids has been found to inhibit the development of the blackhead parasites. To make use of this point is to feed the young birds liberally with some acid-containing food such as sour milk containing a maximum amount of lactic acid. Aside from the mere acid properties it also seems probable that the bacteria of the sour milk exert some prophylactic action in the intestinal tract. This procedure has been employed to such an extent in the experimental work of the station and with such favorable results that we feel no hesitancy in recommending the feeding of large amounts of sour milk to all young poults."

In several experiments poults were fed for weeks at a time on nothing but soured milk and green stuff, about equal parts by weight, and they developed normally in size and weight, from which the experts at the station conclude that these two articles are the only things of which poults may be permitted to eat their fill.

The milk used at the Rhode Island station is not secured in the usual way, but there is added to the sweet milk a foreign bacterium which was isolated by Metchnikoff from the sour milk drinks of the Bulgarian peasants. This bacterium bulgaricum produces in the milk a much higher degree of acidity than is found in milk soured in the ordinary way and is said to have particularly good results when used for poults. It is prepared in tablet form and although rather expensive would probably be worth while where turkeys are raised on a large scale.

The Rhode Island turkey feeding schedule is as follows: No food is given for 48 hours. At the beginning of the third day chopped eggs (including shell) are given at a rate of four grams per bird per day. This amount is gradually increased to the end of the first week, then decreased to the end of the second week, when egg feeding is discontinued. Other feeds are added gradually. For instance, on the fourth day green food is given and continued in ever increasing amounts. On the fifth day rolled oats are added, to be discontinued at the end of the third week. Beginning on the ninth day is given a mash consisting of six parts corn meal, four parts wheat bran, two parts middlings, two parts granulated milk, one part linseed meal. Sour milk feeding begins by the first of the third week, preferably earlier. The mixed grain ration also begins with the third week and continues till the seventeenth week.

The only drug which these bulletins recommend is formidine, which is used in the mash at the rate of from one to two grains per bird per day from the fourth week to the thirteenth. This is an intestinal antiseptic, and to quote the rather careful words of Bulletin 12 "has given some indications of producing good results."

Of course it must always be remembered in planning to raise turkeys that the coccidia which are the exciting cause of blackhead are likely to be found among the droppings in any barn-yard or wherever chickens run. They may it is true be carried by other birds and animals, but they are almost certain to be where hens have been, hence the extreme importance of keeping turkeys away from chickens. The ground on which turkeys are kept should be as fresh as possible and should be changed every year or two unless the range is very large. When we consider how universal is the custom of allowing turkeys and chickens to run together it is easy to see how blackhead has destroyed the turkey industry in the older parts of the country and how it will destroy it here unless turkeys are kept by themselves.

DUCK OF A ROOSTER

Mrs. G. A. Webb of Escondido writes regarding an episode which shows the advantage of perseverance and grit. During the winter floods a big Rhode Island Red rooster nine months old swam the swollen Santa Maria creek twice at a time when it was more than 100 feet wide. As he was carried far down the stream in his trip he probably covered a distance of more than 200 feet going and coming. He nearly made the opposite shore, landing on a partially submerged barb wire fence. It seemed to look too discouraging to continue the trip so he returned to the home side, a total swim of some 300 or 400 feet. He was rather exhausted but a bit of stimulant soon retored him to normal crowing condition. The question is, "Was he a duck or a goose of a rooster?"

SPECIAL PEN SHOW

The Poultry Breeders Association of Southern California is mailing its announcement and official premium list of a Special Pen Show to be held at 409 So. Hill Street, Los Angeles, April 15-17. The association offers a first, second and third ribbon on pens of each and every breed and variety of fowls exhibited.

Classes are provided for every breed and every variety of that breed named in the American Standard of Perfection for Poultry, latest edition published by the American Poultry Association, of which national organization this association is a member. The secretary is Walter M. Ross, 224 West Colorado Street, Glendale.

Save Your Chicks From Lice

Called "Instant" because it kills instantly.

Chicks can't get the right start in life if they are pestered with lice. These parasites inflict constant torment on chicks, keeping their vitality in a low state.

DR. HESS

INSTANT LOUSE KILLER

destroys lice on poultry. Use it liberally on lousy hogs—it will rid them of lice quickly. It is equally good for horses, cows and other farm stock. Sold in sifting-top cans. Guaranteed. West of Rockies: 1 lb. 25c; 3 lbs. 60c. If not at your dealer's, write us.

DR. HESS & CLARK
Ashland, Ohio

THE SCHMEISER PORTABLE AUTOMATIC DERRICK

Saves Money in Handling Hay

The problem of quickly and economically handling loose or baled hay is easily solved by using this derrick. No modern farm should be without it. It can be moved from place to place as easily as a farm wagon. Can also be used for hoisting dirt, raising building materials or heavy loads of any description.

If You Write Us

we will explain in detail just how this derrick can save you time, labor and money.

Write us NOW.

Piles up Hay and Piles up Profits.

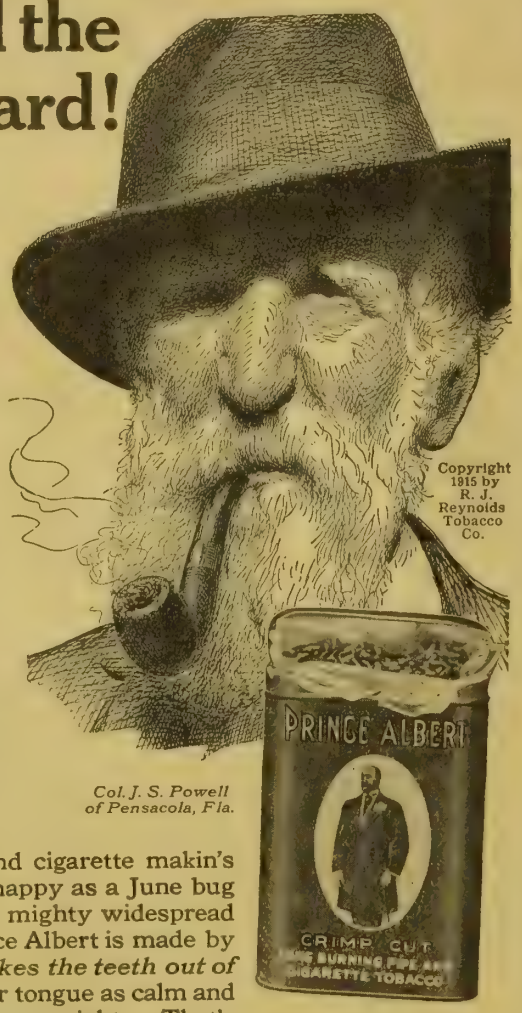
Old-time jimmy-pipers rally round the P.A. standard!

Col. J. S. Powell of Pensacola, Fla., 95 years old, and nephew of William Henry Harrison, the ninth President of the United States, has just been elected to the "old-time jimmy-pipers" club. Col. Powell has smoked for 85 years, breaking into harness as a ten-year-old. We will be glad to receive pictures of old-time smokers.



Col. J. S. Powell of Pensacola, Fla.

Now, everybody sit around close:

Any farmer along the friendly road will tell you never to judge the depth of a well from the length of its pump-handle. Just like it's back-shuffling cards to choose your tobacco from *the looks of the package!*

Pick P. A. for pipe joy and cigarette makin's joy, and you'll be just as happy as a June bug in an apple tree. For it's mighty widespread news nowadays that Prince Albert is made by a patented process that *takes the teeth out of the smoke* and leaves your tongue as calm and peaceful as a harvest-moon night. That's *jimmy-pipe joy* that comes via

PRINCE ALBERT

the national joy smoke

While the spring's young, tune up that old jimmy-pipe and bud-out into a real and true pipe smoker. Sure enough, you'll be in full bloom before the day is done, if you'll smoke P. A. For there's no more teeth in it than in a mocking bird's tune box. *And let that drift into your system!*

Buy P. A. in toppy red bags, 5c; tidy red tins, 10c; pound and half-pound tin humidors—and that classy crystal-glass pound humidor with the sponge in the top that keeps P. A. so good.

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C.

INSURE YOUR SEED

Maricopa County, Arizona, J. A. Armstrong, Adviser, Phoenix

Mr. Armstrong is just taking up his farm adviser work in Maricopa County. He writes: "April 15-24 Prof. G. W. Barnes, live stock specialist, and myself will try to form Cow Testing Association."

He is advising farmers that now is the time to poison ants.

"This is the best time of the whole year to poison harvester ants. The large, red harvester ants of this vicinity, especially, and the smaller black harvester ants to a lesser degree are accredited with $50,000 annual damage to the crop, according to estimates prepared by State Entomologist A. W. Morrill.

"These ants may best be destroyed by the use of London purple at this time of the year before the colonies have had time to multiply since coming out of their winter quarters.

"The poison is applied by making a small ring around each ant hole so that the worker ants must cross it and track it into their underground burrows, thus poisoning their food supplies stored there. It will be necessary to repeat this treatment from three to five times before they will be completely exterminated. This is true because certain influences such as irrigation water, winds, animals, etc., may scatter the poison in such a way that the ants will not come in contact with it. The younger generations replace the older ones and extend their underground galleries in such a way that they are not affected by the poison in the old ones. Ants also have been known to avoid the poisoned food and even in one case to carry a part of it out. For these reasons success will only follow careful and persistent work."

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Power Line

An electric company put poles across land in the absence of and without permission of owner. Line was installed in May, 1913. Would like to know how soon action must be taken against the company and if the owner can compel it to remove certain poles and collect damages for the remaining ones?—Subscriber, Suisun.

The statute of limitations covering easements upon real property provides that an action may be brought thereon at any time within five years. An action however to collect damages would probably suffer from delay.

Commission on Sale

A leases land from B. The lease runs three years. B agrees that A can have the privilege of buying the land (for an agreed sum), before the end of the three years. The real estate agent that brought the renter receives each month from owner five per cent of the rent. Can the agent also claim a commission on the sale of the land, providing A concludes to buy it?—Subscriber, Escondido.

To entitle a real estate agent to collect a commission for the sale of land his authority therefor must be in writing signed by the party whom he seeks to charge or the duly authorized agent of such party. If the agent has only such authority as empowered him to rent the property he could not collect for the sale.

JOE, THE BOOK FARMER

"Joe, The Book Farmer, Making Good on the Land," by Garrard Harris, Harper Brothers, New York, $1.00 net.

"Aw, 'tain't no use, a poor man ain't got no chance in this danged country. If I had enough money to move on I'd go to Oklahomy."

The above is the opening remark of a shiftless, no 'count Southern cotton raiser in "Joe, the Book Farmer." Each year found him still in debt to the storekeeper after his year's crop was harvested. The storekeeper endeavored to get him to diversify and put more modern methods into his farming. Referring to the soil in that particular section the shrewd merchant remarks: "You're dead wrong there, Tom. There's more in the man than there is in the land. The trouble is with you, Tom, not the country or the land. You are just too lazy to learn improved methods—and you are no different in that respect from thousands of other farmers in this country. You won't learn anything." Finally he arranges with the farmer to turn over four acres to his son, a youngster in his teens. At the same time the storekeeper buys the freedom of the minor for one year for $100 and turns him loose on the four acres. He buys for the boy a book touching upon the elements of agriculture and encourages him in taking up a course of study.

The author then proceeds to give details of the boy's work for the year. Of course it goes without saying that he makes a success of his four acres. In state contests of boys' clubs he wins much in prizes and scholarships and possibly succeeds beyond what the average boy would have done, but the tone of the book is right, it is good reading for the boys of the farm and shows how difficulties may be overcome. While it applies to but few sections in California so far as its immediate cultural references are concerned, yet it is well worth putting in the hands of every boy farmer. The book contains 29 chapters with several illustrations.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fly Repellent

Please give formula for making fly oil or fluid with which cows are sprayed to repel flies.—Subscriber, Rio Bravo.

There are many such repellents sold ready to apply. We believe all are good. Where one wishes to make his own the following formula has been recommended: Resin, one and a half pounds; common soap, two cakes; fish oil, one-half pint, and water, three gallons. Dissolve the resin in one gallon of water, and soap cut fine. When dissolved add the fish oil and the remainder of the water. Stir thoroughly before using. Apply with syringe or brush. This is an excellent fly repellent, cheap and effective.

Another, recommended by C. C. Lipp, Veterinary Division, Minnesota Agricultural College, is: Coal tar dip, any kind, one pint; one-quarter bar ordinary laundry soap; one pint oil—fish, linseed or kerosene; 15 pints hot water. This should be mixed thoroughly to form an emulsion, and should be applied as a thin coat by a brush or spray.

We quote recommendations of the United States department of agriculture as follows:

In general, the conclusions are that many of the substances, such as pyrethrum powder, camphor, citronella, and sassafras, while temporary repellents, lose their effectiveness very shortly. Ten per cent solutions of the liquids in cottonseed oil, therefore, commonly have to be applied daily.

Various oils, emulsions of oils, and mixtures of oils are used in repelling flies. Crude petroleum, cottonseed oil, fish or train oil, and light coal-tar oil may be used pure.

Jensen (1909) recommends the following formula, which is said to protect cows for a week:

Common laundry soap, 1 pound; water, 4 gallons; crude petroleum, 1 gallon; powdered naphthalin, 4 ounces.

Cut the soap into thin shavings and dissolve in water by the aid of heat; dissolve the naphthalin in the crude oil, mix the two solutions, put them into an old dasher churn, and mix thoroughly for 15 minutes. The mixture should be applied once or twice a week with a brush. It must be stirred well before being used.

Fish oil is rated as one of the best repellents and has been used alone and in combination with various other substances. Other substances that have repellent qualities and that have been used in various mixtures are pine tar, oil of tar, crude carbolic acid, oil of pennyroyal, and kerosene. The protective action of fish oil is stated to range from less than two days (Parrott, 1900) to six days. Moore's formula is said to protect for two days. This mixture is safe when applied lightly with a brush, but not when applied liberally with a pail spray pump. The formula is as follows:

Fish oil, 100 parts; oil of tar, 50 parts; crude carbolic acid, 1 part.

Laurel oil is a very effective repellent. Mayer (1911) found that the protection lasted from 2 to 12 days. The oil when used pure has an irritating effect unless it is applied lightly. According to Mayer the irritating effect may be overcome by combining it with linseed oil in the proportion of 1 to 10. In the experiments of the department of agriculture, it was found that 10 per cent of laurel oil in cottonseed oil was active for less than a day.

Ticks

If J. W. D. of Modesto will send his name we will be glad to forward paper giving information.

Twin Calves

I have a fine Jersey which has given birth to twin calves, one male, the other female. My neighbors say the female will not breed. Is this true?—Subscriber, Newbury Park.

Prof. Gordon H. True of the state college of agriculture answers: "There seems to be no way of foretelling whether or not the female of a pair of twins will be a breeder. Evidence seems to indicate that in about an even number of cases such females are fertile. There is no way, so far as I know, of determining whether or not this is the case until the animal is matured and bred. I should not sacrifice an otherwise valuable female because she was a twin."

Liver Trouble of Rabbits

Replying to queries as to cause of liver trouble in rabbits, Mr. R. V. Moore says:

"The causes of white spots and tube like growths in the liver and intestines is due to methods of giving green foods. Rabbits in confinement should never be fed cabbage, green alfalfa or grass, for it is almost sure to cause disease and death, especially if the animals are fed heavily on these rations and have not been accustomed to it. As to sugar beets for a diet, we have not had experience, but do not believe it would be a proper feed except given sparingly. Dry alfalfa hay, crushed barley, carrots and bran we find from experience are the best rabbit food. Stale bread is also excellent, but a liberal supply of wheat bran we find is best for a doe just kindled. A lump of rock salt wired to the side of the hutch is necessary, as rabbits, like other animals, relish this. Would advise those whose rabbits have liver trouble or where the organs are discolored, enlarged, full of foul gases, liquids, growths, etc., to quit at once feeding green foods, such as fresh weeds, alfalfa, cabbage and the like."

Wanted, Chicken Ticks

We have request for a few good live samples of chicken ticks. Have any of the subscribers' poultry houses infected with these pests? Dr. Leroy Anderson is anxious to secure such samples.

Rats

We are greatly troubled with rats between the walls of our house. We have tried poison and rat virus without success. How about ferrets? Where may they be had and what is the proper way to handle them?—Subscriber, Carpinteria.

We believe ferrets are not used in this state to any extent. To supply a large Eastern demand a great trade has sprung up in the breeding of these

Cut Rate Seed House

Our Seeds are the VERY BEST, but we are not in the SEED COMBINE. We pay as much for ours as they do for theirs, which the invoices will prove. But their profits are too large. Our slogan: SEEDS at LOW PRICE and NO PRICE can buy better. Send for our Price List.

I Want to Show You This 40 ACRE EQUIPPED FARM

LAND: Level, clean, strong; no brush or stumps; ready for plowing; between two railroads and within 1½ miles of stations on Southern Pacific and Western Pacific. In the Upper Sacramento Valley.
SOIL: Deep San Joaquin loam.
WATER: Unlimited water at 20 to 25 feet.
EQUIPPED: with a plow, a harrow and a cultivator, a pumping plant complete, trees and seed.
SPECIAL: This land is absolutely above all flood from rivers; the titles are clear and guaranteed; there is no bonded indebtedness; there are no reclamation or irrigation assessments. This is clean, strong land without incumbrance of any kind.

BURBANK CACTUS

On Easy Payments and at Prices You've Waited For

Spineless Cactus has come to stay. In ten years no dairyman or feeder will dream of doing without it. It no longer needs demonstration. Its value is known. I sell you the latest and best varieties.

GUARANTEE GROWTH or GIVE MONEY BACK

I own large nurseries all over California, producing the finest cactus, suitable for all soils and localities. For that reason I can take all risk of bad results. There are none when proper varieties are selected from stock acclimated to your climatic and soil conditions.

With each order, which is shipped in a special "Vernon" packing box, I send FREE, FRUITING CACTUS for your garden and for table use, equal to 5 per cent of order.

Through large production, I can give lowest prices, one-fourth of last year's best price, and have an easy payment plan that will please you.

ARTHUR VERNON, Specialist and Grower **Hearst Examiner Bldg., San Francisco**

Advertisements in California Cultivator are Guaranteed
See Announcement at Head of Editorial Page

little animals in New London, Ohio. There are many breeders there who will sell them either singly or in pairs We doubt not this animal would very quickly rid any building of rats. Trapping has proved successful, especially with the old time barrel trap with tilting top, the top being almost evenly balanced and hung on a swivel at either side so that when the weight of the rat comes on the cover it instantly drops him into the barrel, swinging back into place ready for the next one. When a building is once rid of rats it is well to close in by use of cement if possible so as to prevent rats getting access to hidden parts.

Peafowls Wanted

We have again received request for information as to where peafowls may be secured. Anyone breeding these beautiful birds should find increased market by advertising in the Cultivator.

Silage for Hogs

Is silage of value as a part of the ration for growing and fattening hogs? —Subscriber, Los Angeles.

We do not know of silage ever being provided as a part of the ration of hogs on an exclusive hog farm. On dairy farms where silage is fed to cows a small allowance is frequently given to brood sows when they are sufficiently fat, and the object is to furnish roughage and succulence that will carry them along until near farrowing time. A hog is so constituted that when fed for the greatest growth and gains a large part of the ration must consist of concentrates, and profitable hog making demands that animals be finished and marketed as rapidly as possible rather than simply be grown and carried along to be finished later. The roughage and succulence, therefore, should be rather the smaller part of the feed to be supplied the greater part of any herd of hogs. This can best be supplied with alfalfa pasture in this state. The only way we can seee that a silo could come into play with the best results would be in a location where alfalfa could not be grown, and where a very large number, at least a hundred, of breeding animals were kept, but it is hard to imagine a big hog plant without alfalfa. Rape for pasture, supplemented with barley, corn or other grain, and the other crops mentioned to be "hogged down" when mature, are all satisfactory hog feeds. Any of the leguminous plants such as alfalfa, the clovers, soy beans, etc., provide the protein to balance the carbohydrates in corn, barley and other grains satisfactorily. Indian corn makes the best silage, although alfalfa, milo, Egyptian corn and other crops are used.

Marketing Belgian Hares

A Red Bluff subscriber asks how to dress Belgian hares, how to pack for shipping, also whether best results are secured by shipping dressed or alive. A San Francisco poultry purchasing concern prefers receiving them alive in coops. However, we would like to hear from Belgian hare breeders as to their experience in this matter.

Cover Crop

Is barley of any value as a cover crop and at what stage of growth should it be plowed under? Is burr clover as good as vetch for cover crops and when should they be plowed under? We have been told the growth should begin to harden before plowing under and would like information on this point.—Subscriber, Anaheim.

Barley is an excellent crop to supply humus. Some prefer it even to rye, which is one of the rankest growers. Burr clover is excellent, in some sections giving far better results than vetch, but most orchardists prefer the vetch. Either of these, however, are nitrogen gatherers while barley or rye are not but we think as a rule the tendency today is to produce bulk which will supply humus which gives opportunity to secure more nitrogen, therefore our first consideration in the matter of cover crops would be, "Which crop does best in the section where the orchard is located?" As to plowing under, this is a matter for the soil to determine, at least in part. There is, however, diversity of opinion as to ripened cover crops, also cover crops put under when they are lush and green. Many think that humus is secured more rapidly by allowing the ripening and the formation of cellulose in the texture of the plant. The greater number of orchardists plow under early to prevent loss of moisture because of ripening and also to secure more quickly the benefit of the decaying young growth.

Curl Leaf

I send leaves from peach trees. Practically all the leaves on the tree are curled the same as these. The tree looks healthy and has some fruit.—Subscriber, Hollywood.

This is an extremely severe case of curl leaf for which there is no remedy at this period of the year. The tree should have been sprayed with Bordeaux mixture or with lime sulphur solution just prior to blossoming time. This would have killed the spores and the leaves would not have been affected, or at least not so seriously as are these.

When Should Sunflower Seed Be Planted?

Sunflower seed may be planted as soon as the ground is thoroughly warm. The best instruction is perhaps to plant just the same as common Indian corn, planting in the neighborhood of ten pounds of seed per acre. Drills are usually used, being set for rows to be three to three and one-half feet apart. It requires ten pounds of seed per acre.

SPIDERS

With but few exceptions the spiders are all carnivorous, eating large numbers of insects. These are captured in either of two ways. The spiders may attack them boldly, biting them and at the same time injecting a small amount of poison into the wound. This soon paralyzes them. Or it may spin a web and wait for an insect to become entangled in its meshes, when it will rush from its hiding place and throw fresh bands of the sticky web about the insect till it is hopelessly entangled.

Besides using its web to aid in capturing its food the spider uses it in making a home and also for forming a case in which eggs are kept until they are hatched.

Spiders are best known and dreaded as animals that bite. If left alone no spider will bite anything except insects useful for food; but when attacked and cornered all species open their jaws and bite if they can, their ability to do so depending on their size and the strength of their jaws. On the ends of the fingers the skin is too thick for them to penetrate it but between the fingers it may easily be pricked. The bite may swell and smart for maybe a quarter of an hour and then itch for some time, closely resembling a mosquito bite. And it is no more harmful than the bite of this insect.

They are not dangerous animals and should not be killed on all occasions, because of the large number of insects which they destroy.—Charles S. Mead, Colorado Agricultural College.

The Household Department

THE BLOSSOM

Only a little shriveled seed—
It might be a flower or grass or weed;
Only a box of earth on the edge
Of a narrow dusty window ledge;
Only a few scant Summer showers,
Only a few clear, shining hours—
That was all. Yet God could make
Out of these, for a sick child's sake,
A blossom wonder as fair and sweet
As ever broke at an angel's feet.

Only a life of barren pain,
Wet with sorrowful tears of rain;
Warmed sometimes by a wandering gleam
Of joy that seemed but a happy dream;
A life as common and brown and bare
As the box of earth in the window there.
Yet it bore at last the precious bloom
Of a perfect soul in a narrow room—
Pure as the snowy leaves that fold
Over the flowers heart of gold.

—Henry Van Dyke.

HOW SEEDS TRAVEL

SOME seeds make journeys with wings, and others travel from place to place by attaching themselves to the clothes of men or the hair of animals; still others make their journey in the stomachs of birds.

The seeds of the maple trees are particularly interesting. They are provided with wings, and when they become detached from the parent tree a gentle breeze will carry them a considerable distance from the branch to which they were attached. There are many forms and modifications of the winged seed, as the linden, the elm, and the pine.

Some seeds are also provided with parachutes or umbrellas, not for protection from rain and storm, but for purposes of locomotion. The seeds of the thistle, the milkweed, and the dandelion—in fact, the seeds of all plants which have a cottony growth—are provided for these aerial journeys.

Besides these, some seeds are provided with hooked appendages by which they can attach themselves to the clothing of men or to the hair of animals, so that they are transported from place to place. Other seeds have hard seed coats, or shells, which are covered in many cases by edible fruit. The fruits are eaten by birds, but the seeds are not digested, and in this way become distributed from place to place. The groves of cedars which are characteristic of the landscape in many sections of the country, it will be noted are chiefly placed along the lines of fences or fence rows. The fruit of the cedar is an edible one, but the seed is not digestible, and in this way the existence of these hedge rows of cedars is explained. Cherries, grapes, and other fruits are to a considerable extent disseminated in like manner.

The hard nuts of our nut-bearing trees are not used as food by birds or large animals, but are usually sought by squirrels and small rodents, which are in the habit of gathering and burying them in various places or storing them in large quantities for winter use. The result is that a considerable percentage of those which are buried in this manner are never rediscovered by those hiding them, and in time nature causes the hard shell to crack open, and the warmth and moisture of the soil brings the germ contained in the kernel into life and a tree springs into existence. It will be noted that the nuts which were buried by the squirrels did not germinate immediately after being buried, but waited until the warm weather of the spring came before they put forth their tender shoots. This is not because they willed it, but because the hard outer walls of the shell would not admit the air and water to the germ, so as to stimulate its growth.

It was necessary that the shell be frozen and broken by the action of the frosts and the weather before moisture could gain an entrance to cause the swelling of the germ. This peculiarity, when taken advantage of commercially, is called stratification. Seeds with hard shells, such as cherries, peaches, plums, and the like, have to be stratified—that is, they must be planted in the fall where the plants are to grow or they must be packed away in boxes of sand in a position where they will freeze and remain frozen during the winter, in order that they may germinate the following spring. Seeds with thin seed coats, however, like peas, beans, etc., if treated in like manner, will be destroyed by the action of the cold, and no plants will result from planting them in the autumn. Such seeds must, from the nature of the case, be retained in a dry and comparatively warm place during the winter season, in order that their vitality may not be destroyed.

How to Get Rid of Ants

Information of Great Value To Every Housekeeper

Even though you are not troubled with ants just at present, you are almost certain to be in the future—for these pests have a way of getting into every house at some time or other.

Everyone will be interested in knowing, therefore, that a sure exterminator of these annoying insects is now available. It remained for a baker and candy-maker, whose shop was overrun with ants, to devise a means of effectually ridding himself of this nuisance.

So successful did his remedy prove, that it was decided to place it upon the market for general use—with results exceeding the most sanguine expectations. It is for sale at all druggists under the name of Kellogg's Ant Paste—and thousands of houses all over the country have been completely rid of ants by its use.

Try a package today, and if you follow directions closely your ant troubles will be solved forever.

BEAN SOUP, BEAN SALAD,—AND BEANS

The Cultivator household department is constantly in receipt of requests for recipes for meat substitutes. This week we are glad to offer a fine lot of old and new ways of serving beans.

Black Bean Soup

One pint black beans, two quarts cold water, one small onion, two stalks celery (or one-fourth teaspoon celery salt), one-half tablespoon salt, one-eighth teaspoon pepper, one-fourth teaspoon mustard, few grains cayenne, three tablespoons butter, one

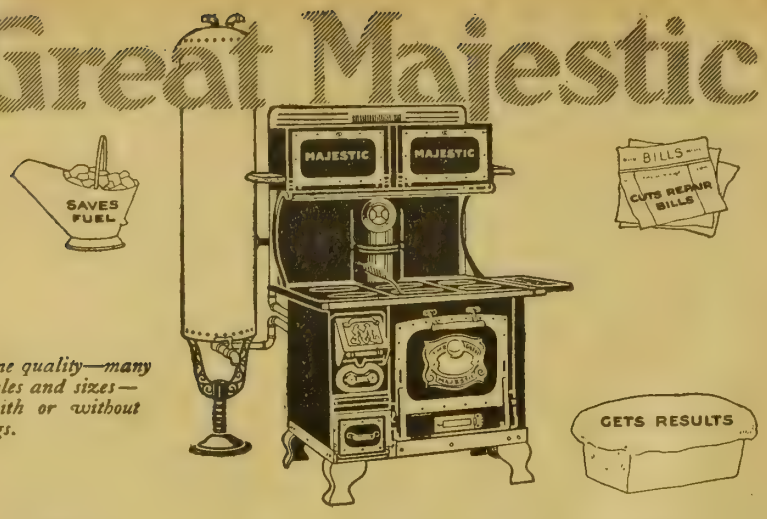
State Land, Overlooked, Now for Sale

In All the Counties

By ALL the counties I mean ALL THE fifty-eight counties of the State. This includes San Francisco and all other Bay Counties and all the rest of the counties. This land has been OVERLOOKED. It was taken years ago when it was not as valuable as it is now and was allowed to go to the State. I help you buy direct from officials. A $5 check brings, by registered mail, three separate large lists of land in ANY THREE COUNTIES of California and particulars as to how to see and buy from a fraction of an acre, not far from the center of any good town, to more than a section of valuable land further out. Write the CALIFORNIA STATE LAND INFORMATION BUREAU, Joseph Clark, Manager, 1511 K street, Sacramento, California.

When writing advertisers, mention the Cultivator.

Great Majestic



One quality—many styles and sizes—with or without legs.

The economy of the best range

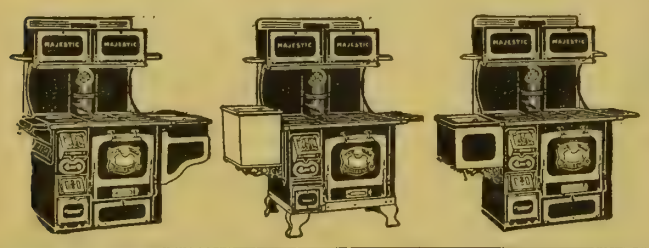
Every bread-baking that fails; every cake that falls, adds to the excessive cost of a cheap range. The range that will produce the best results is the most economical.

The Majestic gets sure baking results because the heating is distributed evenly over all parts of the oven, and is reflected onto the baking by the asbestos lining, thus baking evenly, without turning. Sure baking means economy of both food and fuel.

The heat cannot escape because the oven is hammer riveted and requires no putty. Heat being retained, less fuel is needed to maintain even baking temperature. Better baking with less fuel, is double economy.

The Majestic is made of malleable iron for strength and charcoal iron for rust-resisting—a combination that cuts repair bills and substitutes long service. Preparing better food, with less waste, and less fuel and fewer repairs, over a long period of years, is triple economy, that makes the little extra you pay for Majestic quality and service return big dividends.

The Majestic has many improvements that lighten the labor of cooking and add to its certainties. These are illustrated in "Range Comparison", a little book that will post you fully about ranges. Send for free copy today.



There is a Majestic dealer in every County in forty-two States. If you don't know him, write us for his name.

Buy Telephones for Telephone Service

THERE is as much difference in telephones as in automobiles, and they should be bought as carefully. You want to use a phone giving reliable service. Cheaply made phones sometimes give good service for a week or a month; then trouble begins. Repair bills make cheap phones costly. Voices come over the wire faintly. Many sounds do not get over at all.

With a Kellogg Telephone repair bills amount to nothing. After years of use you can hear a watch many miles away tick loudly and clearly. They are so strongly and simply made that everywhere among users of telephones the name Kellogg has come to stand for ideal telephone service.

Kellogg Telephones Stand for Service

They are made in the largest independent telephone factory in the world. Every instrument passes 37 rigid tests before it is shipped. You have day by day the satisfaction of using a phone that makes telephoning a pleasure.

We have an expert department costing us $100,000 a year that is maintained for telephone users and those who are starting new lines. Why not put your problems before these experts? The service costs you nothing. You cannot fail to get information that will save you time, money and trouble.

Get your name on our books to receive valuable bulletins and other telephone literature that we send free.

Also Manufacturers of Galvanized Iron Tanks.

tablespoon flour, two hard-boiled eggs, one lemon.

Soak beans over night; in the morning drain and add cold water. Slice onion, and cook five minutes with half the butter, adding to the beans with celery stalks broken in pieces. Simmer three or four hours, or until beans are soft; add more water as water boils away. Rub through a seive, reheat to the boiling point and add salt, pepper, mustard and cayenne well mixed. Bind with remaining butter and flour cooked together. Cut eggs in thin slices and lemon in thin slices, removing seeds. Put in tureen and strain the soup over them.

Cream of Lima Bean Soup

One cup dried lima beans, three pints cold water, two slices onion, four slices carrot, one cup cream or milk, four tablespoons butter, two tablespoons flour, one teaspoon salt, one-half teaspoon pepper.

Soak beans over night; in the morning drain and add cold water; cook until soft and rub through a sieve. Cut vegetables in small cubes and cook five minutes in half the butter; remove vegetables, add flour, salt, and pepper, and stir into boiling soup. Add cream, reheat, and add remaining butter in small pieces.

Boston Baked Beans

Pick over one quart beans, cover with cold water and soak over night. In the morning drain, cover with fresh water, heat slowly (keeping water below boiling point), and cook until skins will burst. Drain beans, scald rind of three-fourths pound fat salt pork, scrape, remove one-fourth inch slice and put in bottom of bean pot. Cut through rind of remaining pork every one-half inch, making cuts one inch deep. Put beans in pot and bury pork in beans, leaving rind exposed. Mix one tablespoon salt, one tablespoon molasses, and three tablespoons sugar; add one cup boiling water and pour over beans; then add enough more boiling water to cover beans. Cover bean-pot, put in oven and bake slowly six or eight hours, uncovering the last hour of cooking that rind may become brown and crisp. Add water as needed.

Many prefer to use fresh pork with baked beans, an especially good combination resulting where spare ribs are substituted for the fat salt pork.

Creamed Lima Beans

Shell young green lima beans, wash and add boiling salted water. Slice in one large or two small tomatoes and cook together until the beans are tender. Do not put too much water on the beans to start, adding more as necessary. Let them boil almost dry before seasoning. Sprinkle over them a little flour and season with butter and pepper. Shake well and add enough cream or rich milk to cover. Boil up once and serve.

String Beans

String and remove ends from beans and break in one-inch pieces. Wash, cover with cold water and bring quickly to the boiling point. Drain, cover with hot water, adding one teaspoon salt for each quart of water, boil gently until tender (forty to sixty minutes). Use just enough water to keep from burning. Drain, add two tablespoons butter for one quart of beans, dash of pepper, shake well in the pan and serve at once.

Mashed Dried Lima Beans

Soak dried lima beans over night in cold water. Next morning drain thoroughly and place in a kettle with sufficient cold water to cover; add a teaspoonful of baking soda and when the water boils drain again; then once more cover with cold water, add a teaspoonful of salt and let simmer rapidly until the beans are tender. Drain the water into a dish to use for a soup foundation and press the beans through a coarse sieve. Whip with a fork after adding a little cream, butter and pepper. Heap into a hot dish.

Souffle of Yellow-Eyed Beans

Yellow-eyed beans may be used either plain, stewed or baked, or combined with corn into succotash. For the souffle use one pint of the bean pulp. Add to this the yolks of four eggs, well beaten, and season with a few drops of lemon juice, a quarter of a teaspoonful of celery salt and a dash of pepper. Beat the whites of the eggs stiff; fold them into the other mixture and pile lightly into buttered ramekins; place in a pan filled with hot water and bake in a moderate oven until puffy and brown—about

Culinary Hints

From a Book of Recipes Prepared by Famous Woman Editor

In a book of recipes prepared by Emma Churchman Hewitt, for many years associate editor of the Ladies' Home Journal and other leading magazines, many valuable suggestions are given regarding the use of cornstarch. In the hands of the experienced housewife, cornstarch is often used a dozen times a day. It gives the rich, creamy consistency so much desired in gravies and sauces; the fine texture to bread, biscuits, cakes and cookies, and makes pie crust flaky and perfect. It is also indispensable in making custards, chocolate eclairs, sherbets, ice cream and many other delicacies.

Mrs. Hewitt goes on to explain, however, that there is a great difference in cornstarch, and that good results cannot be obtained with inferior brands. She says that the experience of up-to-date housekeepers everywhere was the same as her own—that those who had the greatest success with cornstarch recipes always depended upon Kingsford's brand.

Kingsford's can be obtained of all good grocers everywhere. It costs no more than inferior brands. Try Kingsford's cornstarch once and you will use it always.

IS YOUR FARM AWAY FROM THE ELECTRIC LINES?

If so, we can put the great conveniences of electric light and household appliances within your reach, and you can have GENUINE EDISON Electric Light and Power—exactly the same as in the largest cities—and just as if you were living on a power circuit. A wonderful Edison invention—the

TRADE Thomas A Edison MARK

ELECTRIC LIGHT PLANT

gives you your own electric light and power plant—economical, efficient, trouble-proof. Reduces fire hazard.

The Edison Storage Battery is composed of nickel-iron parts in alkaline solution instead of the ordinary lead plates in acid solution.

It will therefore do its work much more satisfactorily, and it's the only battery with a four-year guarantee (which it will greatly outlast).

twenty minutes. If desired this may be baked in a large dish, lengthening the cooking to thirty-five minutes.

Horticultural Bean Loaf

Mix two cupfuls of beans with three chopped pimentos, one cupful of breadcrumbs cooked to a paste with half a cupful of tomato puree. Season with pepper, a teaspoonful of salt, grated lemon rind and a few drops of onion juice. Beat the yolks of two eggs well, add to the mixture, and fold in the stiffly beaten whites. Pile into a well-oiled bread-tin, set in a moderate oven and cook until firm. Serve with tomato sauce.

Red Kidney Beans with Spaghetti

The red kidney bean is widely used in Italy, where it is combined with spaghetti into a dinner dish. Olive oil is the fat generally used with it, but if this is too expensive, bacon fat may be substituted. Stew one cupful of red kidney beans, seasoning with one teaspoonful of salt. Cook one cupful of spaghetti until tender, and make a sauce by cooking two tablespoonfuls of minced onion in two tablespoonfuls of bacon fat until softened; add flour to thicken and half a cupful of tomato puree; season well, add to the spaghetti a little grated cheese. Pour the beans, which should be dry, upon a platter, surround with spaghetti and garnish with cooked bacon. These beans are one of the most delicious foods in the legume group.

Baked Beans With Cheese

Prepare the beans as for ordinary baking and add a small onion shaved very thin. Place in the baking dish, cover and bake until twenty minutes before removing; then cover the top with a thick layer of thinly sliced American cheese; cook until melted and brown.

Bean Cakes

Three cups cold boiled beans, put through the meat cutter. Two eggs beaten in a cup of sweet milk. One teaspoon of baking powder. Add flour so you can drop from a spoon. Fry in a spider salt pork or bacon. Remove pork and fry the bean cakes.

Bean Croquettes

Mince any left-over beans and mix with twice their bulk of mashed potatoes. Add a beaten egg and season to taste. Dip the hands in flour, mold the mixture into small rolls, let lie a moment, and then dip them in fine bread or cracker crumbs and fry a crisp brown. Combined with onion and potatoes and well seasoned, left-over beans make an excellent hash, which may be served on crisp toast, or with mustard or ketchup they make a good filling for sandwiches.

Famous Newspaper Writer Endorses Karo Syrup

Marion Harland of Newspaper Fame—Writer of Culinary and Household Page—Prefers It

Marion Harland writes: "I do not hesitate to award Karo the preference above any other table syrup used in my household.

"As an accompaniment to waffles and griddle cakes, it deserves all that can be said in praise of it. It is as clear and as sweet as honey and richer in consistency, without the cloying quality that makes honey distasteful to some, and unwholesome if eaten freely.

"I have also used Karo in the preparation of puddings and gingerbread, with satisfactory results. The candies made from it are pure and delicious."

For griddle cakes and waffles, candy making, icings, cakes, pies, sauces, and many other table delicacies, demand Karo Syrup of your grocer. Nothing will please the children better than a slice of bread thickly spread with Karo. Besides, it is a healthful food, and the little ones will thrive upon it. Ask your grocer for the little book of recipes, which explains the dozens of ways in which Karo is being used daily by women all over the country.

All modern grocers carry Karo. Do not accept any substitute, but try it once, and you will use it always.

Bean Croquettes

Press through a sieve cooked beans, season with salt and pepper and sufficient beaten egg to bind; make into croquettes and set aside to cool and harden. Then roll in beaten egg and breadcrumbs and fry until brown. I serve this on rice with a thick tomato sauce.

Bean Salad

Take one pint of dry white beans, boil them until tender, as for baked beans; allow the water to boil away, season, and mash with the potato-masher. Pack tightly in a dish and, when cold, cut in slices and serve on lettuce leaf with mayonnaise.

Baked Cowpeas

Cook one quart white cowpeas slowly in water until they begin to soften. This will require five or six hours. Put in a bean pot, add one-half pound of salt pork and one tablespoon molasses, and salt to taste. Cover with water and cook slowly six or seven hours. Have pot covered except during last hour of baking.

Hopping John

Soak one quart dried cowpeas over night in water to cover. Cook until tender, adding more water if necessary. Cook a pint of rice in three pints of water, mix the two, season with two tablespoons of butter and two teaspoons of salt. A little beef or pork may be added to the water in which the peas are cooked.

Cowpea Soup

One tablespoon butter or pork fat, one tablespoon finely chopped onion, one stalk celery, finely chopped, one cup dried cowpeas, salt. Soak the peas eight or ten hours in water enough to cover. Fry the vegetables in the butter, add the peas in the water in which they were soaked and cook (preferably in a double boiler) until the peas are tender. Put the mixture through a sieve and add water enough to bring to the desired consistency. Reheat. If this soup is thickened with one tablespoon of flour mixed with a little water the pea pulp will be prevented from separating.

Baked Cowpeas With Cheese

One tablespoon butter, one tablespoon finely chopped onion, one tablespoon finely chopped green pepper, two cups cooked cowpeas, one-half cup grated cheese. Press the peas through a sieve to remove the skins and mix with the cheese. Cook the onion and pepper in the butter, being careful not to brown and add to the peas and cheese. Form the mixture into a roll, place in a buttered earthenware dish and cook in a moderate oven until brown, basting occasionally with butter and water. Serve hot or cold. The latter makes a good sandwich filling.

Cowpea Salad

Mix cold cooked cowpeas with French dressing and serve on lettuce, endive or water cress.

RABBITS AND MARMALADE

In our household department of March 11 appeared requests for recipes for making orange marmalade and cooking Belgian hares. The response was instant and generous. Many excellent recipes were sent in. The first received were published in the following week's issue, that of March 18. Others which came later we have not yet found room to print. Therefore we wish to acknowledge here the courtesy of those whose recipes have not been published as yet. Those who gave us their best method of making orange marmalade are:

Mrs. Ralph Williams, Acton; Mrs. C. H. Crabtree, Sanger; Mrs. B. S. Cummins, Auld; Mrs. E. E. Sherwood, Strathmore; Mrs. Ruth V. Kerfoot, Lemon Grove; Mrs. H. Madsen, Alpaugh; Mrs. H. R. Franck; Mrs. W. H. Sangster, Goleta; Mrs. J. C. Rogers, Fullerton; Mrs. J. T. Pfeiffer, Laton; Mrs. Minnie Carner, Orange; Mrs. N. C. Johnson, Chatsworth; Mrs. E. R. French, Santa Paula; Lotta B. Gitchell, Orange; Mrs. S. D. Teel, Santa Ana; Subscriber, Wahtoke; Subscriber, Pacific Grove; Mrs. J. B., and others who signed no name or address. Next week we will publish the rabbit recipes.

The Agency of a United People

A striking comparison between a homogeneous country and a heterogeneous group of countries is obtained by placing over the map of the United States the map of Europe. These represent the same area—about 3,000,000 square miles—if a few of the remote provinces of Russia are omitted.

Europe has the advantage in population, with more than four times as many people as the United States; in the number of large cities, with two and a half times as many cities of over 100,000 population.

Yet the United States, a comparatively young country, has outstripped Europe in the diffusion of civilization, because of its wonderfully greater means of communication between all parts of its area. The United States not only excels in transportation facilities, but it has nearly three times as many telephones as Europe, or about eleven times as many in relation to population.

By the completion of the Transcontinental Line we now talk from one end of this country to the other, while in Europe the longest conversation is no farther than from New York to Atlanta, and even that depends on the imperfect co-operation of unrelated systems.

Europe, with twenty-five countries and many different languages, serves as an illuminating contrast to the United States, with one language and a homogeneous people, despite the fact that our population has been derived from all parts of the world.

During the last forty years the steadily extending lines of the Bell System have contributed in no small measure to this amalgamating of different races.

The latest achievement—the linking of coast to coast—has given greater force to the national motto, "E Pluribus Unum."

HAY

Under date of April 6 Scott, Magne & Miller say:

Receipts of hay for the past wee were about the same as the precedin week—about 2150 tons. There are ver few changes to note in the market Quite a lot of alfalfa is arriving fron the interior. Most of this, however, ha been purchased for export and has bee brought to this city to be double com pressed to be shipped to Australia th first of May, one shipload having bee sold by Scott, Magner & Miller for thi purpose. It is to be hoped more trad in this line will follow, but as yet nothing is definite. An occasional car o fancy wheat hay or fancy red oat ha will sell at times for as much as $1.0 per ton above our quotations, but an quantity could not be placed at thes figures. Straw remains the same.

We quote the average wholesale pric of hay in carload lots on today's marke as follows:

Fancy Wheat Hay (light bales) ....11.50@12.5
No. 1 Wheat or Wheat and Oat ....9.00@10.5

Citrus Fruit Market

LOS ANGELES, April 7, 1915.

Some of the decay which California oranges are showing is not entirely due to blossoming season. It is almost impossible to secure conscientious help which will handle oranges as they should be handled, and both in orchard and packing house eternal vigilance is the price of sound fruit. There is an apparent letting down of this vigilance. for the season cannot be accountable for all of the decay which has been so manifest. Even under ice a large percentage of decay is still showing. However slightly better conditions obtain than last week. Prices being received are slightly higher and more fruit is being moved. Prices are also somewhat better than last year this same date, but averages for the entire season are somewhat lower than last year. Excepting Valencias there are perhaps 11,000 cars yet to go, which should all be cleaned up prior to May 20. Of Navels there are probably not far from 8000 carloads. The remainder is made up of St. Mikes, Seedlings, Sweets, Tangerines, Bloods and others.

The lemon market is featureless.

Shipments

Shipments of oranges to date from Southern California since November 1. 1914, 15,175 cars, lemons 1.917. total 17,092. To same date last season: Oranges 16,879, lemons 956, total 17,835. Tulare and Northern California points have done no shipping during the past week.

NEW YORK, April 5.—Thirty-six cars navels, four navels and bloods, one navels and tangerines, and three cars lemons sold. Market about 10 cents lower on navels, unchanged on lemons. Cloudy.

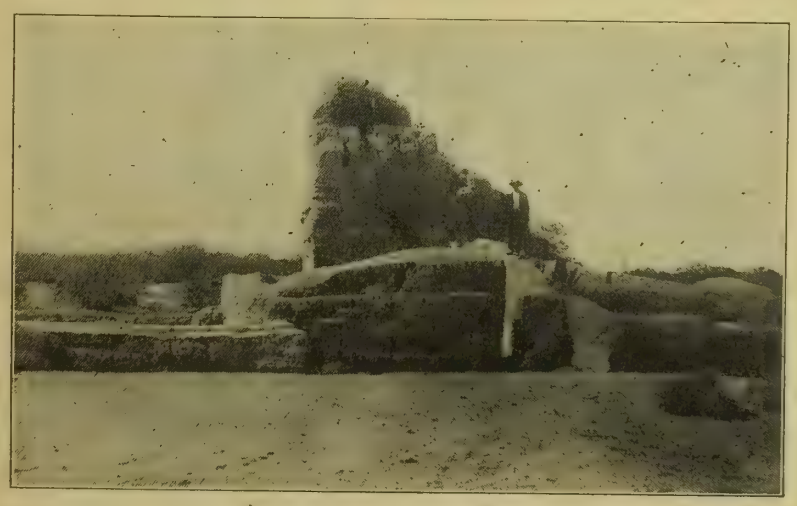
PLANTING AND GROWING BEANS

(Continued from Page 427)

ing until March when tender round podded varieties are used. The Ventura Wonder Wax are, however, used throughout the year by the truck growers. Although other varieties are tenderer the Venturas have a better appearance.

Although plantings of beans are made every month the seedings are very limited until March. It is useless to plant beans sooner unless one's location and soil are particularly adapted, as they must have warm, well drained soil in which to germinate. If the soil is cold and damp the seed will rot in the ground without sprouting, or what few do get through the ground will soon die.



Adobe Ruins, Casa Grande, Arizona, Where Tepary Beans First Grew.

In the Imperial and Coachella Valleys the weather is warm enough so that plantings of beans may be made during February. The product of these are ready for market during April, getting in just ahead of the beans grown nearer the coast.

As spring weather comes on beans may be planted freely, first the hardier bush or dwarf varieties such as the Canadian Wonders, Early Valentine and French Mohawk. These are of the flat type and are inclined to be stringy if not picked very young. These are followed by the tenderer round podded varieties such as Burpees Stringless Green Pod, which is the most popular bush bean grown; Stringless Refugee Green Pod and Early Refugee, in green pods, and Stringless Refugee Wax, Black Wax and Golden Wax in the yellow podded varieties.

By the middle of April in practically all locations any or all varieties of beans can be planted. At this time the popular Kentucky Wonder and other pole or vining varieties and all varieties of Lima beans are put in. There are four varieties of Kentucky Wonders offered, each with its good points. The brown seeded, or Old Homestead, is the most popular. This has light green pods and is well known to all who have ever grown beans. The White Seeded Kentucky is becoming very popular with the market gardeners because it has a deep green pod giving it a very attractive appearance. Besides it is more resistant to mildew than the ordinary Kentucky Wonder. The gray or speckled seeded (see cut) is particularly a good variety, having deep green pods considerably broader than the other varieties. This variety must be poled to get the best results. Then there is the Kentucky Wonder Wax which has the good qualities of the other varieties of Kentuckys but with clear waxy yellow pods.

Gray Seed Kentucky.

Lima beans may be planted as early as March, but to little purpose as beans will not set on the vines until warm weather has set in during July. The bush varieties are far more popular than the pole varieties although the latter will produce more pods per plant. Fordhook bush is becoming the most popular of the dwarfs on account of its plump kernels.

From the middle of August on we use only very quick maturing varieties like Early Refugee or the hardier ones like the Canadian Wonders. During the late fall months a coarse bean known as the Horse or Broad Windsor Bean, is planted for winter use. This bean is highly prized by Europeans as a shell bean.

Garden beans require fairly rich, loose, well drained soil, well cultivated to insure a quick uninterrupted growth.

The plot selected should be deeply plowed and thoroughly harrowed and leveled. If rains do not come irrigation must be resorted to. Each rain or irrigation should be followed by cultivation to make a mulch to retain moisture and destroy weeds. Bush varieties will be ready to pick six to eight weeks from planting, while the pole varieties and Limas are two to four weeks longer.

When beans have been up four or five weeks they should be sulphured by dusting a small quantity of flowers of sulphur over the plants. This prevents mildew. As soon as the crop of green beans has been gathered it is advisable to plow the vines under. They make fine fertilizer. There are some varieties, however, that produce several crops, notably the Kentucky Wonder; green beans may be gathered for several months.

EFFECTIVE

Police Commissioner—If you were ordered to disperse a mob, what would you do?

Applicant—Pass around the hat, sir!

Police Commissioner—That'll do. You're engaged.—Satire.

SLOW

Nellie—Is that fellow of yours ever going to get up the courage to propose?

Belle—I guess not. He's like an hour-glass.

Nellie—An hour-glass?

Belle—Yes—the more time he gets, the less sand he has.—Philadelphia Times.

COMPLETE REFORM

"My wife married me to reform me."

"Did she succeed?"

"Yes, thoroughly. I wouldn't marry again if I lived to be as old as Methuselah!"—Puck.

Watch the fellow ahead, but remember the fellow behind who is after your job.

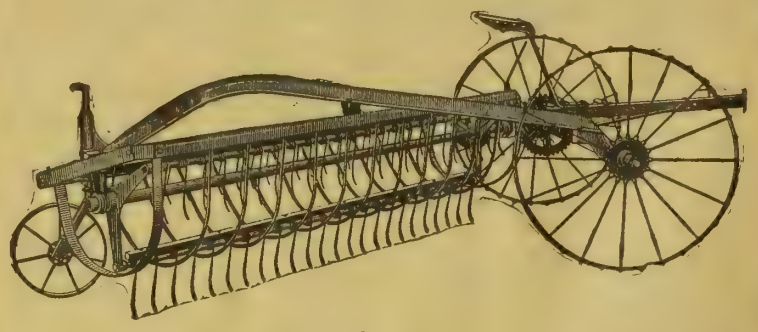
International Harvester Haying Machines



YOUR haying tools must be strong and steady in frame; they must work easily and smoothly; they must get all the hay and put it into the best shape possible. That is why you must consider **International Harvester** hay machines, for I H C hay machines have never been beaten for good work in the field or for durability, at any time or place.

I H C local dealers sell these machines. It is to their interest to see that your hay is put into the barn, stack or bale, in the best condition, regardless of the weather or accident. When they sell you an **International Harvester** tedder, side delivery rake, self or hand dump rake, stacker, sweep rake, loader, combined sweep rake and stacker, or hay press, they sell you a machine that you can depend upon; that will give you perfectly satisfactory service.

Drop us a line, and we will direct you to the nearest dealer handling our machines, and will also send you interesting catalogues on any one of these machines you may be interested in.

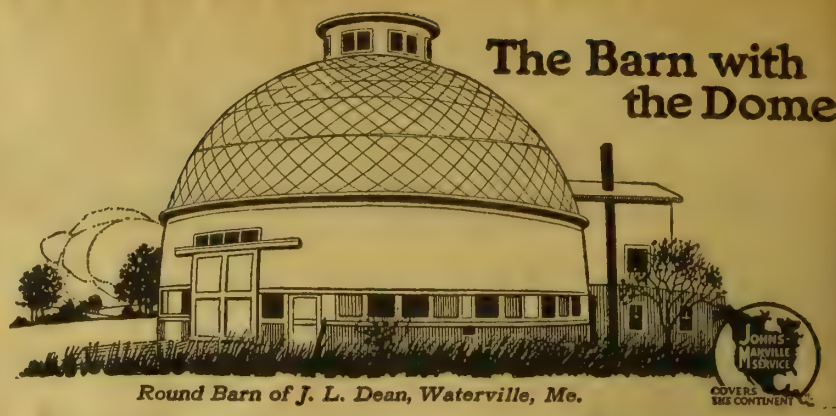
The Barn with the Dome



Round Barn of J. L. Dean, Waterville, Me.

The owner of this barn put on J-M Asbestos Roofing because it never needs painting and is backed up by

J-M Roofing Responsibility

You have something better than the best guarantee ever made when you place your J-M Roof permanently in our care by **J-M Roof Registration.**

J-M REGAL ROOFING is the best "rubber" roofing in the market. It must be, or we couldn't put J-M Responsibility behind it. It retains its life and pliability indefinitely, needs least painting and fewest repairs, because made of Wool Felt thoroughly saturated and heavily coated with Trinidad Lake Asphalt and other natural asphalts. Any one can lay it with J-M Vise-Grip Cleats that make joints and laps waterproof without cement.

J-M Asbestos Ready Roofing never needs painting or recoating, has nothing in it to run, crack or decay, and can not catch fire from sparks or flying brands. Keeps buildings cooler in summer and warmer in winter.

J-M Transite Asbestos Shingles are indestructible and absolutely fire-proof because made of Asbestos and Portland Cement. Never need painting or repair. Artistically beautiful. Shapes and colors to meet any condition.

J-M Asbestos Roofings are examined by Underwriters' Laboratories (under the direction of the National Board of Fire Underwriters).

Write to us about your building and we will give you the benefit of our experience with roofing buildings of that kind. If your dealer does not carry J-M Roofing, we will see that you are supplied. 3058

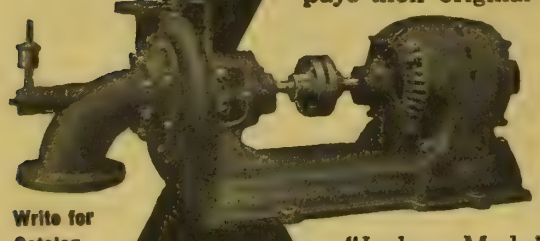
"Jackson MADE"

The greatest test of any pump is its ability to raise the maximum amount at lowest cost per gallon, day in and day out, year after year.

True pumping economy is one of the great features of "Jackson Made" pumps; they work economically and their freedom from repairs and power saving pays their original cost in a few months.



If your pumping puzzles you, tell us—our expert engineers are at your service free of charge.

Write for Catalog No. 48A

"Jackson Made" pumps are manufactured in various styles to do your particular work at lowest possible cost.

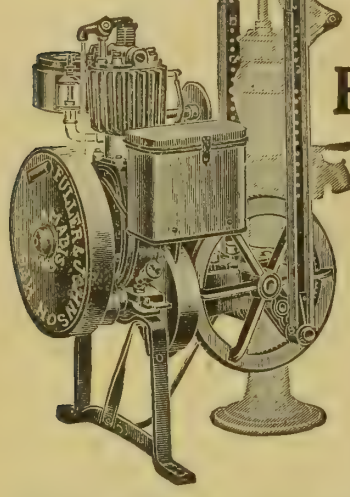
Phillips & Kingsbury, Sacramento County

270 to 2450 Gallons of Water per Hour

Fits Any Pump — Anytime— —Anywhere



This is what the Famous

Fuller & Johnson Farm Pump Engine

will give you—Mr. Farmer and Mr. Ranchman—at trifling cost. No matter how hot or how calm or how dry it is, you can have all the water you want—for watering your stock, your gardens or your lawns, for household use, for washing your wagons and autos, etc., and for drinking purposes—fresh cool water direct from your well. And in case of FIRE, you can command a strong, steady stream at once that will shoot clear to the ridge-pole of your buildings—simply by attaching this wonderful little engine to your hand or wind-mill pump without cleats, special foundation or braces. BESIDES THIS, it will run your cream separator, washing machine, churn, grinder, or any other light mechanism.

OUR NEW LOW PRICE WILL SURPRISE YOU

Besides costing next to nothing to run, the FULLER & JOHNSON Pump Engine costs very little to buy. It comes complete in one crate ready to use. You cannot afford not to have it.

Little Stories of Success

No. 6

A few weeks ago we got signed upkeep reports from 16 owners and operators attending one of our Caterpillar schools—16 little stories of success. The average engine had been in use two years—190 days each year—and had cost only $155 in extras, track and all. These men "behind the engine" figured 1244 working days as the life of the average Caterpillar. One Caterpillar had run five years—180 days and 150 nights each year—and the owners, Williamson Bros., of Farmington, say: "She is good for a lifetime."

Let us give you the name of a Caterpillar owner near you, and let him tell you direct his little story of success.

Both Expositions—San Francisco and San Diego

Get Your Crop in on Time with a "Creeping Grip" Tractor

WHY let low, wet spots in your field set you back? Your time is limited—your crop must be started without delay if you want maximum yield when harvest time comes.

Here's the tractor that asks no favors of soft, wet ground. It can pull your plows through any ground that's worth working. The creepers do not sink or pack the soil—they cannot slip and lose power. They creep along over the ground, getting a firm grip and giving you maximum traction with the least weight on the soil, least consumption of fuel, and least wear and tear on the power plant.

The machine rides on steel rails on the endless track. The creepers oscillate over rough spots. Thus the power plant is carried smoothly, free from jolts and vibration. The frame sets upon 3 points of suspension, which eliminates binding on the bearings.

No other power is as well suited for pulling your plows, harrows, seeders and combined harvesters. Let us tell you how you can cut your present cost of doing this work.

Write for Catalog

No other tractor is as carefully built as the "Creeping Grip." We put in it the best materials than can be produced. A demonstration will convince you. In writing please tell us how many acres you operate, so that we can suggest the best size suited for your work.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

More Live Stock in California

There Has Been no Time in the History of the State When There Was so Great an Interest in Live Stock as Today. No Section Offers Better Opportunities. Then Why Purchase From Other States so Much of Meats and Meat Products?

NEVER was there a time when California live stock growers were so much alive, were showing so much activity in advancing their interests as now. More cow testing associations are being formed, state associations of horse breeders, cattlemen, swine breeders, sheep and wool growers, poultry breeders and others are all most active. The general financial depression is a serious handicap to advancement, but in spite of it the live stock industry grows.

"A live stock country is always a rich country" is as true as it is trite and old, so speed the day when the Pacific coast shall have reached its full capacity as a live stock producer. "Its full capacity" means much, for with California soil, water and climate the wonder crop, alfalfa, richest and most productive of all feeds, makes a condition vastly different from the "50 acres to the cow" of old range days. California has no ambition to feed the world, but it should and surely can feed itself.

The doleful, the long-faced pessimist is throwing fits because of tuberculosis, hog cholera, foot and mouth disease, glanders, the exactions of the railways and the packing trust, but possibly a dash of water in his face may shock him into determination to force from all these adverse factors the success which comes to the steadfast.

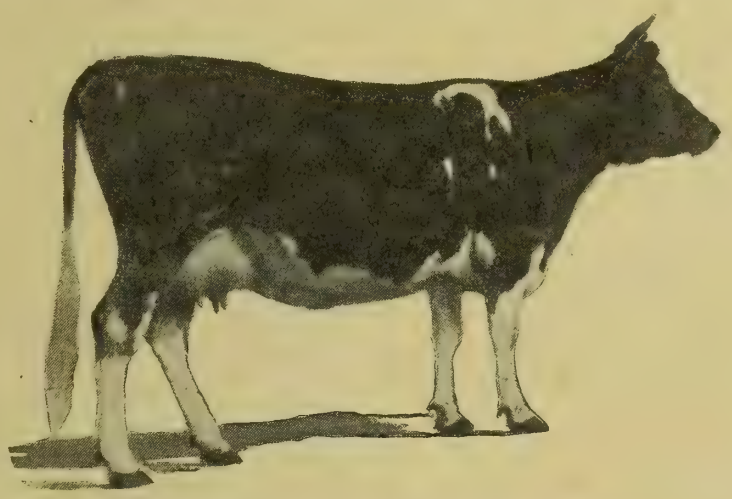
As to the foot and mouth disease, however, it has been kept from the state by rigid quarantine. If this is continued it will prove greatly to the state's advantage. Fortunately there is now within the state's boundaries some of the finest blooded stock in the world. We wish there were more, but in the hands of careful breeders it will rapidly increase and even if no imports are permitted the state's normal demand may be met.

One good feature of the live stock industry is that not only is the wealthy man putting much capital into its development, but the increase in stock is noted on almost every one of the small ranches of the state. The small farmer is finding that from a dozen to 50 sheep are an excellent aid in keeping down weeds along ditch banks and in affording opportunity for fresh meat without paying the long prices required by the butcher's wagon which calls at the door daily or semi-weekly.

We give on this page photos taken by the Cultivator on one of the most highly improved stock ranches of the state. It is that of the Elliott-Brant Rancho in the San Fernando Valley, Los Angeles County. The location is some 30 or 40 minutes run from the center of Los Angeles city, and in a most beautiful locality surrounded by green hills. Within the boundaries of the ranch there are 640 acres, but several hundred other acres are being used to grow grain and supplies for the live stock. The photos given show the care which is bestowed upon the dairy end of the farm. We may refer to the fact that in addition to the dairy department the ranch work is all done by magnificent pure bred Percherons which are also used for breeding purposes.

The swine, Tanworths and Berks, everyone pure bred, have quarters as attractive as are the dairy quarters shown on this page. Several hundred head of pure bred Shropshire sheep with nursing young lambs are in the corrals. Later they will be used to glean over the grain fields.

Even the poultry department of the ranch runs entirely to pure breds. There are several thousand White Leghorns but these are gradually being reduced and the energies of the department given over almost exclusively to the production of Bronze turkeys. Each pen is large enough to contain several dozen turkeys but the number is reduced so that the birds in each pen have abundance of room for exercise and range for insects.



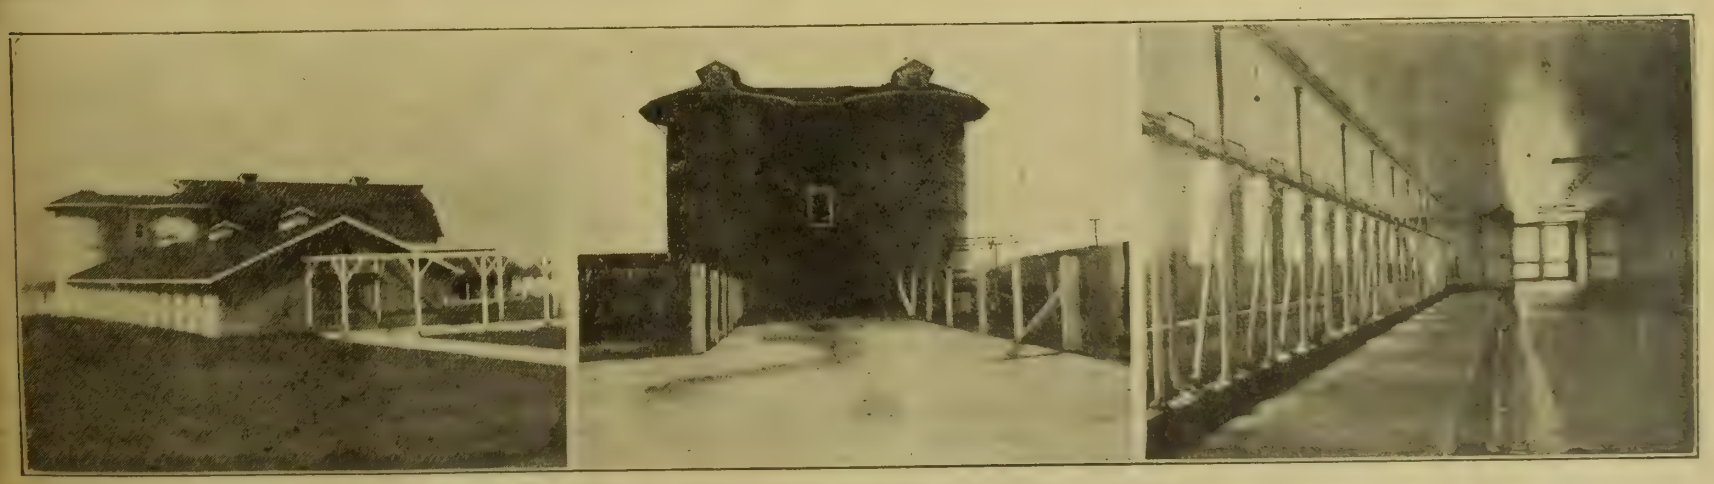
NELLIE'S CARNATION, GRAND CHAMPION COW CALIFORNIA STATE FAIR, 1914

Returning to the dairy we may call attention to the fact that there are some magnificent Guernseys in the herd. Nellie's Carnation, whose photograph appears, is a grand champion not only as to points which the judge at the state fair would consider but as to production. She is now under the advanced registry test and is far enough along to show very plainly that she will be admitted and that she and her offspring will make records as producers in the Guernsey world.

Mr. A. T. Brant, who has charge of the dairy herd, takes much pride in the stables and surroundings. When the writer visited the ranch he went unannounced and uninvited. The photographs of the interior of the "milking parlor," which Mr. Brant prefers to call the stable, were taken without any preparation or cleaning and just as the stable hands had left it after the stock had been turned out for the day. After a thorough inspection of it and the adjoining barns we concluded that Mr. Brant's "milking parlor" was entirely justified. No milking machines have as yet been installed, the preference being for the old time method of milking.

The photographs of the silos in the foreground show the perfect arrangement of the corrals. The soil around the barns is of a sandy loam nature so that but little working up of a muddy condition in the corrals would be possible, but even considering that, Mr. Brant prefers the perfect cleanliness possible only with cement bottoms and abundance of water for flushing. This is also true of the approach to the stables from the front. Broad concrete walks prevail everywhere. At first this may appear like needless expense, but with a perfect product, which is the ambition of this ranch, perfect cleanliness is necessary. The dairy is not what is termed a certified dairy, but its product is the equal of any certified dairy for every precaution is taken to produce for particular customers the very finest product possible from a dairy.

The dairyman who would secure ideas on dairying of the up-to-date kind may have an inspiration by inspecting conditions at the Elliott-Brant Rancho.



AT THE ELLIOTT-BRANT RANCH, LOS ANGELES COUNTY.

Showing concrete milking parlor, silos and feed barn. Bunk house and calf barn on the right.

Concrete silos 37x14 feet. Capacity 250 tons. Sunk into Ground six feet. Tar lined.

Milking parlor interior. Metal stanchions, concrete floors, wide shallow gutter. Note abundance of light, electric lights and ceiled roof.

Absolute Dispersion Sale

of the

P. F. SCHUMACHER HERD

(Recently Tuberculin Tested)

75---Registered Holsteins---75

Ascot Park, Los Angeles
Wednesday, May 12, 1915

Greatest Event!

This is undoubtedly the greatest event of its kind ever held in the West. This sale comprises 60 head of splendid young cows and heifers and 150 highly bred bulls and bull calves.

Great Records

There will be more high record cows in the sale than in any sale previously held on the Coast, including:

White House Belle, 29.27 lbs. butter and 660.2 lbs. milk in 7 days

Alba Sadie Cornucopia Creetia, 28.85 lbs. butter and 612.3 lbs. milk in 7 days

Breeding! Individuality!

Among the good ones to be sold are daughters and granddaughters of such great sires as Sir Sadie Cornucopia, son of the first 30-lb. cow; Rag Apple Korndyke 8th, the $25,000 Bull; Pietertje Hengerveld Segis, son of King Segis out of a 33-lb. cow; Sir Fayne Concordia, grandsire of world's champion heifer under 2 years; Pontiac Hesseltje Korndyke; Aaggie Cornucopia's 3rd, Lillith and others. Also the 3d prize 3-year-old at Chicago National Dairy Show in 1910 and the first prize calf in the Colorado State Fair, 1914.

Bred to Greatest Bred Bull

A noteworthy feature of this sale is the large number of females in calf to **Tilly Alcartra's Son**, junior herd sire of McAlister & Son, the greatest bred bull of the breed and son of the only cow to make over 30,000 lbs. milk in one year. This alone is sufficient to put this sale among the topmost of the sales held in the U. S.

Bulls! Bulls! Bulls!

McAlister & Son, having recently purchased the famous Merci Ranch Herd of Modesto, are consigning their herd bulls, which are among the best of the breed. They are a 3-year-old son of King Segis Pontiac Emperor, seven-eighths brother to the $50,000 bull out of a 20-lb., four-year-old daughter of Juliana King of Riverside; a 2-year-old son of King Pontiac Artis, the greatest son of the Great King of the Pontiacs out of a good record daughter of Prince Hengerveld De Kol who contains 75% same breeding as Hengerveld De Kol; a 2-year-old son of Pontiac Hengerveld Parthenia, sire of the former world's champion, four-year-old out of daughter of Sir Korndyke Manor De Kol, sire of 330-lb. daughter. Other splendid young herd headers to be sold are a son of De Kol Hengerveld Burke, sire of 230-lb. daughters; a grandson of the Pontiacs and a son of the cow that sold for $625.00 at the Hanford sale.

Bull Calves

There will be seven or more splendidly bred bull calves sold, including sons of the above mentioned 28 and 29-lb. cows. They are good enough for anybody.

Your Opportunity

On account of the outbreak of the foot and mouth disease in the East and Middle West there is a quarantine against all shipments of live stock from those sections. This will be your only opportunity for many months to buy high-class registered Holsteins at your own price.

Terms

$500 and under, cash. Over $500 ⅓ cash; balance in three equal installments of 3, 6 and 9 months with bankable note bearing 8% interest; 5% discount allowed on time sums. Buyers from a distance must bring satisfactory bank references.

The Useful Goat

Written for the California Cultivator
By Leroy Anderson

INTEREST in these oft-despised animals is much on the increase, so say goat raisers. A well known breeder said to me the other day that he had never known a time of more frequent inquiries. A breeder of milch goats said that in answer to an advertisement which he placed in an agricultural journal to sell three bucks, he received over two hundred letters.

Milch Goats

It has been estimated that in Germany seventy-five per cent of the households keep goats. They are not confined to the poorer people but the prosperous middle classes consider the goat of advantage to them also. Other European countries, especially those bordering upon the Mediterranean, could probably show as high a percentage of families depending upon the goat for their supply of milk, butter and cheese. A German author writing of the goat says: "It furnishes to its owner without doubt, the best milk for nourishing infants for the household, for the cooking of food, and for coffee, besides butter and cheese.

Geneva and Three Babies

When one considers that it very often depends solely on the milk production of the goat whether the nutrition of the child and the whole family is good or bad—and the nutrition from infancy on has a bearing on the ability to perform a greater or a comparatively small amount of work in later life—then one will believe me when I say the goat is in a position to wield a great influence in sustaining life.

Jensen in his "Milk Hygiene" gives the composition of goat, cow and human milk as follows:

	Goat.	Cow.	Human.
Water	87.30	87.75	87.92
Casein	3.00	3.00	0.58
Albumin	0.50	0.50	0.52
Fat	3.90	3.40	3.43
Lactose	4.40	4.60	7.12
Salts	0.80	0.75	0.25

J. R. Chisholm of Queensland, Australia, several years ago wrote: "We had a terrible season last year and most of us lost heavily in sheep, but the goats kept us going on their milk all the time; and it was in that dry time that I overcame my prejudice and ate and relished goat meat, or, as you would call it, venison. The goats served us well until the rains came. I have just asked my girls about the flock, and they tell me they milk 18 nannies and make from four to five pounds of butter weekly from them and have besides an abundance of milk for our household of eight."

Breeds

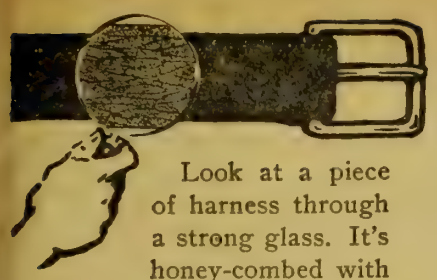
One would need to name nearly all the countries of Europe, Asia and Northern Africa to list those having particular breeds of milch goats. But that would not be sufficient to number the breeds, for Switzerland is credited with having at least 16 pure bred varieties. Every valley in the little country has its distinct type. The chief breeds that have found their way to this country are the Toggenburg, Saanen and Schwarzwald, the two former from Switzerland and the third from Southwest Germany. So far as California is concerned the two Swiss breeds are the prominent ones, with Toggenburg in the lead. The illustration in this issue is of pure bred Toggenburgs, owned by a prominent breeder in Alameda county.

The Toggenburg is brown in color with a white bar down each side of the face, and the legs below the knee are light gray or almost white. The Saanen is pure white or creamy white. It is the largest breed in Switzerland. Both breeds are lean and lanky in appearance, "of pronounced dairy type," the cow man would say. A good average production of milk for these breeds is four or five quarts a day. The best produce about six quarts daily with occasionally one showing up even better. As a rule they are quite persistent milkers, holding out well toward the next kidding time.

Prices obtained for stock in California are remunerative. Registered Toggenburg bucks sell from $50 to $100 per head. Registered does are so scare and so few in number comparatively that there is no established price. If a breeder is willing to sell a pure bred doe he has no trouble in securing almost any price he may ask. Grade does sell from $20 to $30 per head, and these are purchased by families who want a goat to supply milk either for infants or for the family. There is a good market for grade bucks with Italian butchers, in San Francisco for instance. Such kids when only six to eight weeks old sell at the door, alive, at $2.50 to $3.00 each for the Easter market. Following Easter the price is usually $2.50 f. o. b. station, the breeder crating and shipping them. The meat at this age is considered a great delicacy among the Italian colony.

California Experience

Every time I go out to visit a goat ranch I look for it on a hillside and I have never yet been disappointed. Milch goat ranches are now located for the most part in the neighborhood of cities, large or small. There is the market for the milk which retails usually at 25 cents a quart. There is also the chief market for does, purchased by town and city families. However, goat men tell me there is no reason why one should not establish himself on a level piece of land in a strictly agricultural section, even in an alfalfa district, if still quite accessible as to transportation. Suburban goat ranches are on land held at $500 to $1000 an acre to as much as



Look at a piece of harness through a strong glass. It's honey-combed with pores—like a sponge. But you can't see them with the naked eye.

EUREKA HARNESS OIL

If moisture, sweat and dust are allowed to get into these pores, they gradually sap the life and strength of your harness. An occasional application of Eureka Harness Oil fills the pores of the leather and resists the attacks of the elements. Eureka adds years of life to your harness. It pays to use it. for a building lot. Here practically all feed is purchased through several middlemen. The ranch in the country raises its own feed and operates on land of much less market value. The chief drawback to a goat ranch at a distance from milk consuming population is the disposal of surplus milk. Making cheese offers the best solution of that question.

For a single feed nothing seems better than alfalfa hay with a little rolled barley. Asking a breeder near Oakland as to the cost of keeping a goat he said he charged one dollar a month for boarding does and that just about covered the cost of food. The goat likes a variety and is never happier than when on a grassy, weedy, bushy hillside where it can vary its diet at every mouthful. The doe must, however, have plenty of nutritious food if it is expected to give a lot of milk. The same rule holds as with the milch cow. An alfalfa rancher has all the advantage of feeding conditions if he likes breeding live stock.

Prejudice against goats has hindered and still hinders trade in them. Americans are so fond of doing big things that they think anything so small as a goat is not worth considering. Our conception of the goat was a plaything when we were children, an eater of tin cans in our back yards and a butt of ridicule at all times. That this prejudice gets hold of foreigners who settle here is illustrated by experiences related by a goat breeder who lives near a Portugese settlement. He says the parents keep a goat because they were accustomed to milking goats in Portugal where they had them giving as much as four quarts a day. But as the children grow up they become ashamed of goat society and induce the old folks to part with nannie. Such prejudice must be lived down and is being lived down as all classes of people are learning by experience the life saving qualities of goat's milk. This is evidenced by the fact that the demand for milking does is ahead of the supply.

The doe has from one to three kids, the young does usually one and when older usually two. The average of a flock would be two kids for each doe yearly. The first kid should not be dropped until the young doe is two years old, and then the doe is bred once a year. The goat has a comparatively long life, 10 to 15 years. In comparison to sheep raising on a small scale it would seem that milch goats promise well, with grade male kids worth $2.50 at six to eight weeks old, grade does in milk at $20 to $30 and registered stock at high prices.

Angoras

So much is known of the Angora that it may be sufficient to quote here now some prices of animals and products. The mature goat produces about four pounds of hair worth 30 cents a pound. The skins are worth from one to two dollars each for large ones and from 10 to 50 cents for small. Angora goat meat sells at about one cent less per pound than mutton, though I presume we consumers pay the same. Registered males sell for $25 to $100 each and registered does from $12.50 to $25.00. It is usually considered that hilly land is best for them but they will thrive on level land if not wet so as to cause foot rot. Angoras are valuable for hair and meat and the skins and since not counted in the milk producing class must be kept on the cheaper land.

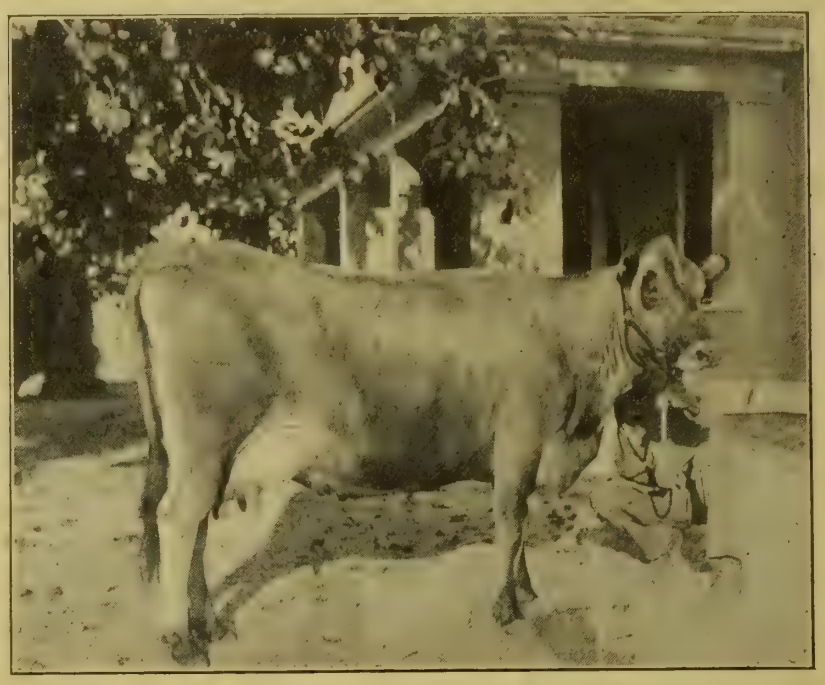
Why Cow Testing Associations Fail

Written for California Cultivator
By Guy H. Miller

FEW practical dairymen nowadays will deny that the organization of a cow testing association in a dairy district is a public and private benefit, for the fact that the individual cows composing dairy herds should be tested for yearly butter fat production, that the unprofitaable producers may be weeded out, is, at last, slowly but surely, being realized by the dairying public.

That the cow testing association is one of the easiest, simplest and cheapest means of doing this work is also realized, and many cow testing associations are being formed. Such movements are an assurance of progressive ideas among the dairymen of a community and should be fostered and encouraged. But every dairyman who joins a cow testing association should bear in mind—in fact, should take it seriously to heart—that attending the first few organization meetings and agreeing to have his herd tested is but the smallest part of his duty to the organization and to his fellow members.



WANDA OF VENADERA
One of Guy Miller's Breeding

The forming of a cow testing association is the forming of an organization for mutual benefit, wherein each member by the help of his financial and moral support attains a desired end, which is that each member gets his cows tested for a year by a man competent to do this work. One of the greatest factors in bringing about the failure of many cow testing associations is the neglect on the part of so many of the individual members to realize and appreciate this fact. Many dairymen attend the organization meetings and display much enthusiasm, sign up the contract to have their herds tested, agreeing to pay for this work in certain payments at certain times, help elect a president, a secretary and a board of directors, all of whom, except the secretary, are expected to donate their services free of charge. Then the dairyman goes home and forgets that he has any further duties in the matter; forgets that he has become a member of an organization for mutual benefit and for the benefit of the community. When the tester comes to his place he has his cows tested, but when his payments come due he forgets all about sending the secretary a check for the amount; neither does he ever find time to attend the meetings when called. After a while he receives a bill for his dues, calling his attention to the matter, and he forgets it again. Later he gets another bill and a letter saying that the board of directors are urgently in need of funds with which to meet the expenses of the organization, and asking him to remit. Then he gets mad and begins to kick about the way the thing is run—says the tester does not attend to his work, or accuses the officers of misusing the funds, makes up his mind he will quit testing, tells the tester not to come any more and refuses to pay his bill.

Sometimes, after testing a few months, a dairyman whose herd has shown up well will use the records made as a means to sell his herd at a good figure, and then says he has sold out and that the association is no further benefit to him, so he should not be asked to pay his dues as promised, though the work of the association enabled him to get an advanced price for his cattle. Or a dairyman finds that his herd is one of the lowest producers in the association, and he decides that he wants to stop testing and sell out before the public finds out anything about it; so he says the tester doesn't know his business or the association is a fake and so he gets out of it. Of course he never pays his dues and pretends he is insulted if he is presented with a bill.

A cow testing association when organized generally makes the dues as low as possible consistent with the known necessary expense. Only a limited number of herds can be tested by one tester. It is not an organization with a surplus working capital engaged in a business for the purpose of making a direct profit. But it is a fraternal organization for mutual convenience in obtaining a desired end, that the members may have a better knowledge of their own private business; and every dairyman on joining a cow testing association should cheerfully assume the obligations of paying his dues promptly, giving the officers his support and good will, thus showing appreciation of the fact that the directors are giving their time free for the management of the affairs of the business. All the money promised in dues is required to meet the obligations of the organization. The dairyman should remember that if he fails to come through with his share of the money the association will lack that much of being able to meet its expenses. This condition helps to cast discredit on the officers and the association.

If any member thinks the tester is not competent or is negligent he should at once take the matter before the directors at a regular meeting in a friendly spirit, for all are equally interested and all are desirous of securing reliable and accurate results.

I do not wish to be understood as saying that all cow testing association members are shirkers, or that they try to evade their dues. There are many loyal members who pay their dues promptly and who work for the association and stand by it through thick and thin; but there are unfortunately some shirkers in nearly every association, and in many associations there are enough of this kind to keep the organization in embarrassed circumstances continually, because they are so negligent in making their proper payments. For the lack of funds the association gets behind in paying the tester's salary and it is hard to keep a good tester on the job. The secretary fails to get his salary. And if

GENUINE BURBANK SPINELESS CACTUS

The demand for the genuine Burbank Cactus was never so great as now. The growing and feeding values of the plant have been proven. Feeding tests conducted by practical dairy men show that the Burbank Cactus-fed cow will yield from $5.00 to $7.00 per month more than when fed on alfalfa alone.

We have been growing and distributing the Burbank Cactus since 1908. We have established a world-wide business and a reputation for fair-dealing. We have today an immense stock of plants of the best proven Burbank Varieties, both forage and fruiting. We handle nothing else. We do not recommend any of the so-called Spineless Cacti known as Mediterranean, Sicilian, Italian, Government, etc., etc., nor any of the newer-named, fancy-priced Burbank varieties which have not yet been proven and which are expensive because they are scarce.

this condition persists the association will necessarily go on the rocks.

The time is rapidly approaching when the testing of each cow will be recognized as almost a necessity. There are more reliable ways of doing this than by joining a cow testing association, where but one day's milking monthly is weighed and tested; but there is no cheaper or easier way. A man can test his own cows and get more reliable information than through the association. A cow's milk should be weighed at every milking throughout the year; not one day in a month, and it should be tested for at least four successive milkings during each month. Any careful dairyman can learn to test his own cows; but this work takes time and patience, and few dairymen will give the necessary time to this work to do it right. They start out with good intentions but fail to keep up the good work. As proof of this assertion I will call the reader's attention to the many Babcock milk testing machines throughout the state stowed away where they have not been touched for many months. The realization of such a condition brought into existence the cow testing association for the mutual convenience of the busy dairymen. And every dairyman who has any appreciation of fair play should realize the mutual obligation assumed in joining and be willing to keep up his end of the bargain.

California Stock Raising

Written for California Cultivator
By Sacramento Valley Contributor

CALIFORNIA has always in one way been a big producer of live stock. All of the mountain and hill ranges furnish grazing for thousands of cattle and sheep, and some of the big live stock companies of the United States are located here.

And only 28 per cent of the area of California is land in farms and only 11.4 per cent improved land in farms, leaving a large per cent for grazing and waste land.

In many places, not only in the eastern states but right here at home, it is thought that California is a fruit state principally and it is possible that many fairly well informed people would guess and state that citrus fruit brought to the state the greatest single revenue. Yet of the agricultural wealth produced in the state annually 19 per cent comes from hay and forage, 15 per cent from animals sold and slaughtered, 13 per cent from cereals, nine per cent from dairy products, and only eight per cent from tropical fruits, including oranges, lemons, olives, figs, grapefruit, loquats, dates, etc. Other orchard fruits; plums, peaches, prunes, apricots, cherries, etc., make up another eight per cent, and grapes five per cent more.

There is not included in the animals sold and slaughtered four per cent for fowls and eggs sold and one per cent for wool and mohair.

The money value of all of the agricultural products is $219,021,000. The animals sold and slaughtered return $33,627,000.00.

Agriculture without live stock is not on a sound basis. This statement is made with a permanent agriculture covering a long period—many generations, in fact—in view, and from this viewpoint certainly cannot be contradicted. It is true that some highly specialized forms of production in specially favored localities have been and are being carried on without that diversity which brings live stock directly into the operations, but there are few, if any, that do not use quantities of animal manures.

The most satisfactory system of farming, from the standpoint of the individual and the welfare of the nation, is a diversified agriculture with the production of live stock in a prominent position, but with the intensive orchard or field crops for which the location is suited being developed to whatever degree is justified. In this system the by-products of the crops are turned into high priced live stock products, and the manure from the live stock is invaluable for increasing crops and maintaining and adding to the fertility of the land and the physical or mechanical condition of the soil.

And nowhere are there better opportunities than in California for success in this kind of farming.

The people of our part of the world must have meat, whether they get luxuries or not. Forecasters of affairs are not able to look into the future and see a time when meat products are likely to be produced at a loss or even at a small margin of profits. This is a general proposition and applies to the man on a small diversified farm who not only feeds and finishes, but breeds and grows the live stock he markets. Large operators in feeding enterprises are not always able to figure what the market will be 90 days or six months hence, and frequently lose large sums, as cattle feeders did during the past season. But the small grower made money.

It is interesting to note that even in districts that are being boomed for one kind of crop or another, oranges or prunes or rice or some other special crop that promises fabulous returns, conservative, far-seeing farmers and stockmen are steadily increasing their operations, growing more alfalfa and other feed, building silos, breeding better stock and making money in a sure if not a very spectacular fashion, apparently willing that the enthusiast who may think them slow should make the big money.

And on the other hand, and along the right thinking line of conservative diversity, old-time grain farmers and stockmen are putting out 10 and 20 and 40-acre orchards on suitable land and in many cases taking good care of them—which is as it should be—both for the individual and the community.

One of the arguments met in the East in connection with the live stock show at the Panama Pacific International Exposition was, "What's the use of taking live stock to an orange country?"

We will do well to let the world know—and fully realize ourselves—that we have one of the greatest live stock states in the Union in spite of the fact that we are specially favored in being able to produce luxuries in the shape of orchard and other crops.

Encourage community cooperation in every way possible with the purpose of obtaining the best educational, social and economic development of farm life.

DAIRYMEN ORGANIZE

Dairymen of Southern California, especially those supplying sweet cream and milk to the Los Angeles market, have organized themselves into the Southern California Milk Producers' Association, an organization for the mutual benefit of milk producers of Southern California. The first move toward an organization was because of a cut made by the purchasers of milk in the Los Angeles market. A cut of 25 cents per 100 pounds was made, reducing the price of $1.60 per 100 pounds for four per cent milk during the months of January, February and March; $1.80 for the second quarter, $2.20 for the third quarter and $2.40 for the last quarter of the year, or practically an average of $2.00 per 100, making a reduction of about 25 cents per 100 pounds.

One cause for the reduction announced by the so-called milk trust was that overproduction made a larger quantity than could readily be handled in that market. To this the dairymen replied that if the consumers of cream in Los Angeles would cease buying low grade skim milk powder and cheap butter and manufacturing homogenized cream there would be plenty of consumers to handle all the fresh cream and milk shipped to the Los Angeles market. In any case, the dairymen propose to get business and fight for their own interests, and one step is an effort to induce the state dairy bureau to do its duty and prevent the use of this manufactured "cream." The matter has also been presented to the board of health of the city of Los Angeles but no effective work has been done yet by the city or state organizations.

The officers of the Southern California Milk Producers' Association are C. M. Whaley, president; L. F. Gillett, vice-president; Ben A. Rhoades, 1505 South Main Street, Los Angeles, secretary. The next meeting will be held at Burbank Hall, Los Angeles, April 21.

5 Good Reasons Why—

You Should Feed

Larrowe's Dried Beet Pulp

—to Your Cows

(For more detailed information write for a copy of our booklet "Profitable Feeding")

1st INCREASES THE MILK FLOW—1 to 5 lbs. per cow a day.

2nd AIDS DIGESTION—cows will have better health and less bag trouble.

3rd EASY TO FEED—keeps indefinitely and is always available.

4th SUCCULENT—displaces silage or can be fed with it if desired.

5th CHEAPER THAN BRAN—or other mill feeds and gives better results.

Now is the logical time for you to start feeding this wonderfully efficient vegetable feed. No matter what ration you are now using, Larrowe's Dried Beet Pulp can be added to it profitably. Order one sack from your feed dealer and test it on one cow whose milk record you know.

LARROWE'S DRIED BEET PULP

—can be had either plain or with molasses. Comes packed in convenient 100-lb. sacks—each pound swelling to six times its natural bulk when moistened. A splendid feed not only for dairy cows, but also for horses, hogs, sheep, etc.

Citrus and Tropical Fruits

THE CALIFORNIA ORANGE INDUSTRY

Address by C. C. Chapman at Panama-Pacific Exposition on Orange Day, March 20

THE whole nation rejoices over the splendid achievement of grandeur and beauty of these buildings and the marvelous display of soil and factory—of the genuine, progress and culture of the race which they contain. I am bold to tell you that no people more whole-heartedly rejoice or feel a deeper personal pride in all this glorious enterprise than the orange growers of California.

For more than 20 years I have been closely identified with the orange industry of California, and this occasion when the golden products of our orchards is so highly honored is most gratifying to me and I assure you is greatly appreciated by the orange growers of the state.

It is a great personal pleasure to briefly discuss some of the more important factors entering into the development of the orange industry to its present predominance in the business of our great state, which it has enriched in both wealth and renown, for to me the culture of the orange is a most fascinating occupation, attracting more interest in the process of development of both tree and fruit than any other product grown for profit in this country.

Scientifically speaking, the orange is a berry. The membranes which separate the pulp and the rind are only the enlargements of the vesicles which produce seed.

The original varieties or sub-species, the bitter orange and the sweet or China orange, are distinct in almost every respect, but by cultivation, hydridization and budding with each other and with the citron and the lemon, the orange in its present form has been developed. For beauty, richness of flavor and wholesomeness as an article of food it is without a peer in the fruit world.

To successfully grow the orange, certain fundamental conditions of soil, climate, water and topography must be considered. The Divine Hand has been lavish in bestowing upon California a rare perfection in all these features which combine to produce natural advantages greater than those enjoyed by any other section over which floats the Stars and Stripes.

Our magnificent mountain ranges not only form the most picturesque scenery and giant bulwarks to guard the fertile valleys, but great natural reservoirs where is stored the water to be carried to the beautiful orchards below. Our coasts are washed by the boundless Pacific, with numerous harbors for commerce. Our climate is faultless the year round. In fact, in fertility, topography and climate California is especially adapted to the culture of the orange.

The orange was introduced into California by Catholic Missionaries in the beginning of the last century. About the year 1834 the first planting outside the mission grounds was done, and in 1841 the first orchard for profit was set out on land now in the heart of the city of Los Angeles. During the following 30 years a few small orchards were planted here and there over Southern California, but it was not until in the seventies when the Washington Navel and the Valentia Late were introduced that the orange industry received the impetus which has brought it to its present gigantic proportions and seems destined to carry it beyond all prophecies and all imagination.

The orange at once became the leading product of California and since that time its culture has attracted thousands, until at present there are engaged in its production in this state more than 10,000 growers, cultivating 110,000 acres of bearing trees and 60,000 acres of non-bearing trees. There are upon this vast acreage trees enough to line with branches touching both sides of an avenue that would entirely encircle the globe, and there would still be trees left to border the great Lincoln Highway from San Francisco to Chicago. Approximately $200,000,000 are invested in the industry. More than 20,000 laborers are employed in it, and more than 150,000 people depend directly or indirectly upon it for a livelihood.

The annual production is from 35,000 to 45,000 carloads, or from 12,000,000 to 18,000,000 boxes. To give a more comprehensive idea of the vastness of this quantity of fruit, let me tell you that it would make a solid tower 100 feet square, eight times as high as the magnificently beautiful Tower of Jewels which is unquestionably the crowning architectural achievement of all the gorgeous and pleasing structures of all the fairs ever held. The value of the crop this year is something like $30,000,000; for carrying this fruit to the markets the railways annually receive from $13,000,000 to $15,000,000.

Another indication of the marvelous strides the industry has made and its commercial importance is the fact that a continuous stream of the golden fruit flows out of California to the markets of the East. Until more recent years shipments were made during only a portion of the year but now not a day passes that does not find cars rolling Eastward.

Growers have found that comparative ease in the cultural management of an orchard and its production depends largely upon the initial work in preparation of the ground and in setting the trees. Following in the development and life of an orchard there are certain essential points which must always have attention, such as irrigation, cultivation, pruning, fertilization and the fighting of pests.

It is not my purpose to discuss these questions in detail. I will, however, say that there has been much thoughtful study and investigation along all these lines, until today the average grower is fairly well informed and does good and scientific cultural work. Manufacturers also have given attention to the building of implements best adapted to scientific orchard farming. In addition there is being developed a splendid citrus literature which will prove a valuable aid in the further progress of the industry.

I claim that the orange growers of California as a class are the most in-

telligent and enterprising agriculturists to be found in the world. They have had to meet many difficulties and obstacles in the culture of the fruit, more perhaps than are encountered by other producers, but all these they have successfully mastered. We are deeply indebted to the agricultural department of the government for much valuable assistance in solving many of our problems. Our own state, through the agricultural department of our splendid university, has also rendered the growers' service without which I am sure the industry would not have grown to its present magnitude.

I want also to express the appreciation and gratitude of the orange growers of California for the wise and generous provision recently made by the state legislature for the establishment of a citrus experiment station and graduate school of tropical agriculture in Southern California. This indicates the general interest of the people of the state in this, her most attractive and valuaable product, and instances the enterprising spirit of our public men that has done so much in attracting to California so many splendid people from the East.

Scientific investigation and experimentation by men specially trained will continue to assist the citrus growers in solving the difficulties which confront them, giving added confidence to them, and permanence to the business.

While we grow a hard orange in California, in this respect as in all others better than any other orange grown in the world, yet care in handling must be observed all along the line. Growers have learned valuable lessons in this department of their work, both from their own experience and from the assistance given by experts sent to us from Washington. The result is that today but little complaint is made of decay in California oranges in the East.

In no branch of the industry has there been greater improvement than in packing houses, packing house equipment and methods of handling the fruit. In the preparation and packing of the orange many intricate processes are involved which are perhaps not appreciated by the consumer. We have in this state scores of packing houses provided with machinery and facilites for handling the orange which equal in scientifically arranged convenience and extent many of the manufacturing establishments of cities noted for the quantity and quality of their product.

The marketing of a product so extensively grown and demanding a nation-wide distribution is of itself a Herculean task, but to it our growers and shippers have been found equal. In harmony with all the other branches of this great industry the shipping and marketing of the fruit has come to its present system through processes of evolution.

The bulk of the fruit is handled by the most gigantic and perfectly articulated cooperative marketing system ever organized by the growers of any product. To this system all growers are indebted, for it has in a very real sense been the making and the saving of the industry. There are other smaller cooperative organizations and many splendidly managed independent companies which handle under approved and modern methods a large quantity of fruit. I say without reserve that the various packing, shipping and marketing concerns handling the California orange are a credit to the business interests of the state.

The Citrus Protective League, the organization which I have the honor to represent on this distinguished occasion, has within its membership practically all shippers of California oranges. It is a mutual organization, giving its attention to the general good of the industry. It has rendered valuable service in securing cheaper freight and refrigeration rates, leading our fights for tariff protection and gathering valuable data, and in many other ways has made a large contribution to the industry.

I covet the language that would enable me to adequately set forth my high estimate of the California orange and the fascinating work of its culture, of the commercial importance of the industry to our great state, and of the incomparable beauty and wholesomeness of the fruit as an article of food. It is the king of all fruits, standing without a peer, all of its splendid points considered, and it not only contributes largely to the wealth of the state but to the general health of the whole nation. Its delicious juices are as invigorating as they are palatable, giving to man increased nerve power and a clear brain. May California continue to produce in increasing quantity to supply the greatest nation of the world with a fruit that is fit for the gods.

THE CARE OF TOOLS

Many more tools are spoiled by improper grinding than by breaking on account of defects in the material or due to the original temper.

Tool grinding is what may be termed non-productive work, and while we believe the old saying, "no time is lost in putting tools in order," we are anxious to get through as soon as possible and get back to work.

Protecting the temper of tools is of the utmost importance. When you make sparks or turn blue spots on the edge of a tool you are injuring it. There are two ways by which heat may injure the metal of the tool. One way is by burning the edge, causing it to crumble.

Be patient when grinding tools. Take plenty of time and do the work thoroughly, and you will be rewarded by having tools that will hold their edge, and will do good, smooth work. —H. J. Wilson, Colorado Agricultural College.

Induce the young people to take more interest in local and county fairs.

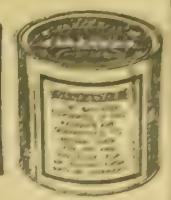
INSURE YOUR SEED

Get a "catch", a good stand, and a big yield of ALFALFA, BEANS, Peas, Vetch, and *all other Legumes*—inoculate with

The Improved German Soil Inoculator. Nobbe-Hiltner Process

NITRAGIN

PURE CULTURE



Gold Medal St. Louis 1904

THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES

Inoculated ALFALFA Not Inoculated

"NITRAGIN" is the *original* Pure Culture—*a granular* medium (*not* a jelly)—nothing to break or spill—packed in a ventilated can, containing millions of surfaces, supporting billions of nitrogen-gathering germs, their health, strength and virility

Guaranteed for Six Months by the Armour Fertilizer Works.

Absolutely harmless. Easy to use. An investment—not an expense. Remember—legumes not inoculated take *no* nitrogen from the air. Inoculated legumes mean bigger yields, richer feeding value, better soil.

Pure Culture inoculation is endorsed by the U. S. Dept. of Agriculture and other authorities. Thousands of satisfied California ranchers testify to the wonderful results obtained with "NITRAGIN"—the *Original* Pure Culture.

Avoid Imitations. LOOK FOR THE ARMOUR OVAL LABEL.

Make your crop sure. Inoculate with "NITRAGIN". It can be obtained for *any* legume.

YOU WILL HAVE TO HURRY

It is only a matter of days now and then—

YOU LOSE A WHOLE YEAR FOR PLANTING FRUIT TREES.

Send today for our revised FEBRUARY STOCK LIST.

We are fruit growers and shippers as well as nurserymen. Our buds are selected for propagating only from parent trees having the best record for quality of fruit and productiveness, thus insuring a pedigreed tree. Our years of experience, knowledge and observation as nurserymen and fruit growers are at your service. We show you how to succeed.

If you already know

just what trees you want, do not wait for the STOCK LIST. Send in your order. If the trees you want are still in stock, your orders will be immediately filled.

Don't Delay
Order today.

Deciduous Fruits

CURED FRUIT BULLETIN

San Francisco, April 6, 1915.

OUR dried fruit market is still very quiet and in a very unsatisfactory condition, and on account of there being considerable quantities of spot stocks on hand in the various markets there has been practically no demand for coast shipments, and one of the things that is also preventing much heavy buying is the fact that the indications are for a heavy crop of all varieties of fruit for the coming season.

The lack of demand on prunes has forced prices to a lower point than they have been held. While the carryover, we believe, will not be much over 300 cars, holders seem anxious to unload and move stock and are shading prices. The large sizes, for which there is very little demand, bear the brunt of the reduced prices. Santa Clara prunes today are being quoted at 3¾ cents, and a good many sales have been made at 3½ cents. Outside districts, other than Santa Clara, about ⅛ cent lower. In 1914 on account of the smaller crop of prunes very little distinction was made between Santa Claras and the outsides, but this year with the prospects for a large crop there will more than likely be a better price realized for Santa Claras. Some of the outside districts have prunes which are equal in every respect to the best Santa Claras and which should bring equal prices.

Apricots and peaches are both quoted at lower prices, with the demand very slight. Peaches today are being quoted for about 3¼ cents base for Standards. We are informed that on account of the high price at which prunes have been held that the state board of control in the state of Washington has made a contract for dried peaches for state institutions in preference to prunes because prunes are 50 per cent higher than peaches. On apricots there is practically no demand for new crop. Buyers are holding off with the idea that there will be a diminished export demand, and if this turns out to be the case it is likely that the prices in the United States will be lower. We hear of quotations having been made on the three grades of Santa Clara apricots at 8½ cents basis.

The selling of futures, which is being indulged in to a certain extent, is a very bad practice and should not be indulged in. It is a matter of gambling, and gambling as far as the fruit grower is concerned should be eliminated. The practice of quoting futures at low prices enables the buyers to go out to the producers and offer them low prices for their product. Fruit should not be sold until we are in a position to know approximately what the fruit crop is going to amount to, and we would ask our members to advise all their friends to not sell to buyers until they are more definitely informed as to conditions. The year just past and the outlook for the coming year is a very strong reason why the growers should get in command of the situation and should cooperate much more strongly and endeavor to control their own business.

The present indications are for a large peach crop for 1915, with the prices probably as low as 1914, and on account of this it is very essential for all of our members to be very careful of fruit that they dry this year. In the first place the thinning should be done very carefully, so as to raise the grade of the fruit and thereby get better prices for it, so we would request everyone of our members to thoroughly thin all trees so as to produce larger peaches and thereby a better quality; to thin early and not to wait until the pits begin to harden; and in thinning, as much as possible, to leave the peaches on the underneath portion of the limbs, instead of those on top. The grower who has large peaches will get just as much weight with less labor and more money than those who have a large quantity of poor, undersized fruit. This applies equally to apricots, so don't forget that the large, fine quality of fruit is what you want to get results with. Many a grower is afraid to go to the expense of thinning, feeling that he is not going to get his money back, but our experience has always shown that it is quality that counts. You can always sell good fruit when you cannot get the buyer to talk to you about poor fruit, and by all of our members having good fruit it is going to strengthen your organizations and create a better demand for "Blue Diamond" fruits.

We are receiving a good many letters from our representatives throughout the country, and they advise us that the prospects at the present time look good for a good crop; they also state that jobbers advise that the usual demand for this season of the year has not been as great as for former seasons, and that their spot stocks of California canned and dried fruits are larger than usual, with the possible exception of prunes. They see no immediate prospect for an increased demand, with the result that purchases of additional supplies will be limited from now on. It is generally conceded by Californians that everything points to a large and satisfactory crop for the coming season, and because of this fact, jobbers and dealers are not inclined to anticipate their wants, and there are so many features that will enter into business during the balance of this year, all of which will have a tendency to keep market values down.

Weather conditions have until lately in the East been very good, but we notice in the last few days that there has been considerable damage done by frost in some sections, and should the report of this damage be founded on facts it may help things materially, but one thing to be carefully thought about is the fact that growers must cooperate to get results; they must own and control the fruits of their investments, and when they do control, they will receive much better prices than they can get today when their output is controlled by those who seek to handle it for profit.—California Cured Fruit Exchange.

CROP ESTIMATES

RETURNS are coming in from various sections of the state where subscribers of the Cultivator are observing conditions in the apricot orchards. Only a faint idea is to be had this early, but plainly the apricot crop will be short. However, the state is more or less spotted, as will be observed as the reports continue to come in. We will let our subscribers speak for themselves.

G. H. Waters, Pomona, Los Angeles County

The apricot crop is up to the average. Trees are looking fine. Peaches are setting well on most all varieties. Looks as if a full crop would mature.

A. Everett, Moorpark, Ventura County

The present indications are for not over one-half of an average crop of apricots. The trees are irregular in blooming, the leaf buds starting too soon. Many trees have a thin setting of apricots as large as ripe cherries,

and with leaves half size, while some of the branches are just blooming. A few trees are too heavily loaded with fruit while many other trees have hardly any.

Prunes and peaches are not raised here commercially, but the few trees grown indicate good crops.

A. L. Shively, Santa Paula, Ventura County

From the best information that we can gather the apricot promises to be only a medium crop; some orchards having a good setting while others are very light. We have no peaches in this vicinity.

C. C. Thorpe, Manager California Walnut Growers' Association

I just returned last week from a trip through Ventura County and noticed that the apricot crop is not going to be as heavy there as it was last season. The setting is quite light and I don't believe that there will be much over 70 per cent of last season's crop in Ventura County.

At the present it looks as though the state would turn out this season the largest walnut crop ever shipped. Conditions have been ideal and the setting of fruit on the trees is unusually heavy.

J. G. Berneike, Santa Ana, Orange County

The apricot crop will be light. The sulphur salesmen claim to have placed about 60 per cent of orders, compared with last year. The output of dried apricots for 1914 for Orange County is stated to have been 1200 or 1250 tons, I believe. I look for this to be cut about one-half because of light crop and cutting out apricot trees, and would consider 60 per cent a maximum figure at present. The quality and size of fruit promise well to date; drying will probably not begin till after July 4.

The peach crop in Orange County is a negligible quantity commercially.

The walnut trees show heavy setting. The crop is likely to be considerably larger than last year with a large per cent of No. 2's and very few Jumbos. The smaller size of the nuts and the probability of later maturing will expose the crop more easily and for a longer time to the danger of burning if a hot wave should come before harvest.

It is therefore very likely that the 1915 crop will by no means equal the 1914 crop for quality.

The fruit growers of California certainly owe the California Cultivator their good will for the effort you are making in getting truthful crop reports.

Leonard Coates, Morganhill, Santa Clara County

The apricot crop in Santa Clara County is "spotted," but promises a fair yield; trees generally looking healthy and vigorous. The Royal is heaviest bearer and needs thinning. Blenheim, however, is the variety most largely planted. Peaches are setting well and prunes look better than they have for several years; this is shown in free shedding of the "jackets" and rapid swelling of the young fruit.

There is quite a difference between economics and practical farmers, yet some of the economists do not seem to discriminate. Economists may be poor farmers and farmers poor economists and it would not be wise for either to give the other advice as to the other's business. The economist may render much valuable assistance in marketing and rural credit, but as an adviser in farm management he is as far out of his sphere as a farmer in politics.

SPRAYING POME FRUITS

The pear, apple and quince belong to the pome fruits. These fruits are subject to the attacks of the codling moth. The late ripening varieties of these as a rule suffer more from the codling moth than the early ripening kinds because the later broods of the codling moth are considerably larger than the early broods. In the warmer and lower valleys the unsprayed orchards are liable to have more wormy fruit than the orchards of the same varieties in the cooler and higher altitudes. In the higher altitudes there are not as many broods of the codling moth nor as many worms of the different broods, consequently it is necessary to give more careful attention to the subject of spraying the pome fruits in the lower and warmer valleys than it might be in the higher districts.

Entomologists have observed that the life cycle of the codling moth is approximately seven days from the egg to the larva; 19 days from larva to cocoon stage; 18 days from cocoon stage to the emerging of the moth; five days from the emerging of the moth to the middle of the egg laying stage, being approximately 49 days, or seven weeks. Since the life of the summer broods is approximately 50 days and, if the broods did not tend to overlap, as they do in southern New Mexico, three sprayings would probably be enough for the number of broods that have been observed at the experiment station. It is found however that the broods overlap and that there is a continuous stream of larvae coming out during the growing season.

In order that there might be a more or less definite period at which practical orchardists may apply the spray, a spraying schedule has been worked out at the experiment station, based upon the number of the broods and their habit of emergence.

The first spraying is given when about 90 to 100 per cent of the blossoms are off the trees. This is a calyx spray and should be applied with considerable force and be somewhat coarse. The second spray is given about 20 or 25 days after the first one. The subsequent sprayings are given every 25 days after the second one. If this schedule is followed the orchardist is more likely to get the spray on all of the fruit just before the maximum number of larvae of each brood is ready to enter the fruit and also have the poison on the fruit for the larvae which emerge between the maximum periods. The number of sprayings necessary for the best results depends upon the locality and upon whether the fruit is early or late ripening. Under valley conditions at the station it has been found that it pays to spray the late ripening varieties from five to six times. In the higher altitudes this number of sprayings may be reduced to three or four. For the early ripening varieties two or three sprayings give excellent results.

Last year's spraying results for the Bartlett pear were very encouraging. The Bartlett was in full bloom on April 10. The maximum number of moths of the wintered-over larvae emerged during the first ten days in April. The larvae from the maximum number of the wintered-over moths were ready to enter the fruit approximately on April 20. The first or calyx spray given the Bartlett pear trees was on April 22. This spray was thoroughly done with a power sprayer using 180 pounds pressure. A Bordeaux nozzle giving a coarse driving spray was used. One and one-half pounds of the dust form of arsenate of lead was used to 50 gallons of water for the first and second sprayings. The second spray was applied on May 16. The third was applied on June 15, five days later than the scheduled time because the orchard had been irrigated and was too muddy. The fourth spraying was given on July 10. Three pounds of the paste form of arsenate of lead was used for the third and fourth sprayings. The last three sprayings were applied with a Vermorel nozzle giving a fine, cone-shaped spray which seemed to coat the pears with arsenate of lead very well.

On July 25 520 pears were gathered from tree 1. All of these were sound. On August 13, 154, 217, 259 pears were gathered from trees 2, 3, 4, respectively. On tree 2 two wormy pears were found. There were 1148 sound and two wormy pears gathered from the four trees, giving over 99 per cent sound. On August 13, from two unsprayed Bartlett pear trees 488 pears were picked, 214 being wormy and 274 sound, or 56.26 per cent sound. The figures show that the spraying saved over 43 per cent of the crop from being wormy.

It is likely that three sprayings will be sufficient for the Bartlett pear in the lower and warmer valleys.

It is necessary for the best results that the spraying be thoroughly done and that it be applied at the right time. Fabian Garcia, New Mexico College of Agriculture.

"WINTER RHUBARB, CULTURE and MARKETING"

By

Reginald Bland

A complete manual of field culture for this valuable crop, filling an important vacancy in Agricultural Literature. Chapter titles are: **Rhubarb and Winter Rhubarb, Selection of the Location, Preparation for Planting, Planting, Culture, Picking and Packing, Marketing, Propagation and Development.**

This new book will be useful to successful growers; **Invaluable** to beginners, to prospective planters and to those who may have been unsuccessful; Interesting and Instructive to all.

The strenuous pioneering years are over. Recent developments have brought new life and impetus to rhubarb culture. One company, shipping from 200 to 250 cars annually (over 90 per cent of the total California production), says, "We now have more customers on our books than we have rhubarb"—and only a few of the big eastern markets have been supplied. Every one who wishes to profit by this great opportunity should have the sound, practical instruction and advice to be found in

"Winter Rhubarb, Culture and Marketing"

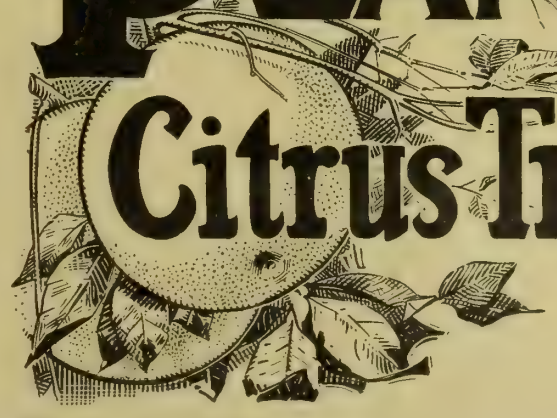
PLANTERS Now is the time for you to Order Nursery Stock-Buy the Best

Citrus Trees and Olives



"R. & W." Trees are always cheapest in the long run

OUR SPLENDID STOCK OF ORANGES, LEMONS, POMELOS AND OLIVES—in all the leading varieties, should be investigated before placing your order. It makes no difference how few or how many trees you may wish to buy, we can supply you with the choicest quality stock and at prices that will certainly prove tempting.

ASK FOR OUR "BULLETIN ON THE OLIVE," GIVING VALUABLE INFORMATION that should be in the hands of every planter. We specialize on the growing of fine olive trees and have an exceptionally choice assortment of Mission, Manzanillo and other varieties. Olives are coming into their own and if you contemplate planting, it is particularly necessary that you should plant the varieties which are going to prove the most profitable at the time your trees come into bearing.

"ROEDING'S PRACTICAL PLANTERS' GUIDE" —— SENT FREE

This book is the result of Mr. George C. Roeding's more than 30 years' experience in California horticulture. It tells how and when and what to plant. Also gives detailed information illustrated with photographs on PRUNING. Contains 11 pages of valuable data on citrus fruits and olives.
If you intend planting send us your list for prices and suggestions and we will send you a copy free—otherwise the price is 25c. Write us to-day.

Studebaker

WAGONS BUGGIES HARNESS

AMPLE PROOF THAT IT DOES—AND IS DOING —ITS WORK

My father purchased our Studebaker before I was born. Just a short time ago I hauled 3,000 pounds of coal on this wagon, so you can judge it is some wagon yet, for an old one.

I use the old Studebaker every day or whenever I need a wagon.

It has always stood out in all kinds of weather up to eight or nine years ago, when I commenced keeping it under cover.

Charles Stratton,
Andover, Ohio

Hauls 3000 pounds of coal on 40 year old Studebaker

CHARLES STRATTON, of Andover, Ohio, is using, every day, a Studebaker Farm Wagon that was bought before he was born—40 years ago or more.

The fact that he can haul a ton and a half of coal on the old wagon indicates that it is still paying returns on the original investment.

Why Studebaker Wagons Last

It is the way Studebaker Wagons are built — and the fine material used — that makes them last so long.

Carefully selected, air dried lumber, tested steel, analyzed paint and varnish, skilled workmanship and the experience of sixty-three years all go to make a Studebaker Wagon last a lifetime,

No other wagon lasts as long, or gives as much service as a Studebaker — and this isn't a "claim," it can be *proved*. We have records of hundreds of wagons forty years old and over.

Divide the cost of your wagon by the number of years' service it gives you and you will find that a Studebaker is the cheapest wagon on earth.

Ask your dealer to show you the proofs he has of Studebaker Wagons lasting forty years and more.

Studebaker Buggies and Harness give equally good service.

Economics on the Farm

RURAL CREDITS

THE following is the full text of the section on rural credits in the report of the secretary of agriculture for the year 1914:

Closely related to production and distribution of farm products is the securing of capital by farmers on better terms. This problem has attracted the profound attention of the country and still awaits a full solution. The difficulties arise partly from the diffusion and sparseness of the rural population, partly from the failure of proper business adjustment, and partly from the inadequacy of the security which part of the farming population normally can offer for loans. The problem is one of extending the banking machinery and facilities more intimately into the country districts for the convenience and the assistance of the rural population and of the effective mobilization and utilization of the resources of the country people themselves.

The chief difference of opinion arises over whether there should be special aid furnished by the government. There seems to be no emergency which requires or justifies government assistance to the farmers directly through the use of the government cash or the government's credit. The American farmer is sturdy, independent, and self-reliant. He is not in the condition of serfdom or semiserfdom in which were some of the European peoples, for whom government aid was extended in some form or other during the last century. He is not in the condition of many of the Irish farmers for whom encouragement and aid have been furnished through the land-purchase act. As a matter of fact, the American farmers are more prosperous than any other farming class in the world. As a class they are certainly as prosperous as any other great section of the people; as prosperous as the merchants, the teachers, the clerks, or the mechanics. It is necessary only that the government, so far as geographic and physical conditions permit, provide machinery for the benefit of the agricultural classes as satisfactory as that provided for any other class, and this the government has attempted and is attempting to do.

It is the judgment of the best students of economic conditions here that there is needed to supplement existing agencies a proper land-mortgage banking system operating through private funds, just as other banking institutions operate, and this judgment is shared by the leaders of economic thought abroad. The national banking system up to the present time has labored under restrictions imposed by law which made it impossible for the national banks to solve the problems in the most effective way. State banks with fewer restrictions, with smaller capital requirements, and abilty to lend on real estate have established more intimate touch and have perhaps rendered greater assistance. Likewise certain agencies, such as building and loan associations, insurance and mortgage debenture companies, and the cooperative credit associations recently created by state legislation in Texas, Massachusettes, New York, and Wisconsin, operate to extend capital to the farming districts, and thereby in a measure tend to cut down the rate of interest.

Federal Reserve Act

When the national banking law, commonly called the federal reserve act, was under discussion in congress the matter of farm credits was considered and debated, but it was decided that the subject as a specific program should be separately dealt with in another act. The federal reserve act was passed with a view to the improvement of the banking conditions of the country in the interests of all classes; to the restoration of normality in banking; to the establishment of a reserve or banking power which could be utilized in times of emergency; and therefore with a view to secure good banking at all times and to prevent panics. It is not a banker's law or a business man's law or a manufacturer's law or a farmer's law; it is a law for all classes—for all the people. However, there were incorporated into the act several very important provisions which had in mind specifically the needs of the farming classes and the possibility of extending banking facilities to the rural districts.

It was specifically provided that a federal reserve bank might "discount notes, drafts, and bills of exchange arising out of actual commercial transactions—that is, notes, drafts, and bills of exchange issued or drawn for agricultural, industrial, or commercial purposes, or the proceeds of which have been used or are to be used for such purposes." The federal reserve board was given the right to define the character of paper thus eligible for discount. It was further distinctly provided that nothing in the act should be construed to "prohibit such notes, drafts, and bills of exchange secured by staple agricultural products, or other goods, wares, or merchandise from being eligible for such discount." It was provided that the ordinary notes, drafts, or bills admitted to discount should have maturity at the time of discount of not more than 90 days, but that notes, drafts, and bills drawn or issued for agricultural purposes or based on live stock might have a maturity not exceeding six months. Not only is paper arising out of agricultural transactions made eligible under the act, but it is given a longer maturing period than other forms of paper. This apparent discrimination arose naturally out of the fact that agricultural operations are seasonal and involve a longer period than other ordinary commercial transactions.

Again, it is provided in the act that national banking associations not situated in the central reserve cities may lend on improved and unencumbered farm lands within the federal reserve district, and that such loans may be made for any period up to five years. Such loans may not exceed 50 per cent of the actual value of the property. Any national bank under this provision of the act may lend on farm lands an amount in the aggregate equal to 25 per cent of its capital and surplus or one-third of its time deposits. The federal reserve act, therefore, so far from discriminating against the farming classes, distinctly bears them in mind, and while not discriminating in favor of them takes just and particular knowledge of their requirements.

Banking Habits

The matter of additional legislation concerning farm credits was promptly brought to the attention of congress by the president at the regular session in his annual message, and many experts have been giving persistent and careful attention to the problem.

The explanation of why special banking arrangements were devised abroad but have not been extensively planned and operated in this country is to be found in the difference in economic, social, and banking habits and conditions. This is the only large country that may be said to have the ordinary banking habit developed in a high degree, with bankng and lending associations democratized and in touch with the masses of the people. The great masses of people in a number of European countries do not have the ordinary banking habit and know little about banking practices. The habit of depositing money in banks, of checking against such deposits, and of making loans through banks in such countries is not general. This may be illustrated by a reference to the Bank of France. This bank, with a billion dollars of bank notes, has only $285,000,000 of deposits. A bank can utilize its assets either through notes or through discount and deposit and

checking. In this country the assets of a bank are utilized to a slight extent through bank notes, the total volume being about $725,000,000, while the total deposits in all the banks are $17,000,000,000. This testifies to an unusual development of the banking habit among our people. Partly because of the lack of the ordinary banking habit on the part of European peoples, partly because of the lack of banking facilities, and partly because of other social and economic factors special agencies had to be devised. There was great need for some addition to their machinery. The land mortgage and the cooperative credit arrangements grew up of necessity. Likewise the savings banks were created for similar reasons. It is noteworthy that only recently have saving institutions been established in great numbers in this country, and that still more recently the government postal savings system has been evolved.

Land-Mortgage Banks

Notwithstanding the fact, however, that the people of the United States have ampler financial agencies than any other in the world, and have developed the habit of using these agencies to a greater extent than any other peoples, students of rural problems have been keenly alive to the need of further improvements. They have insisted upon extensions of the national banking facilities and the creation of special agencies in intimate touch with farmers with a special view to the betterment of financial conditions in the country. At least two definite measures have been prepared and have received special consideration. They are similar in many respects. They provide, in brief, for land-mortgage associations with a small capital, which may make loans on farm mortgages within a district of a state or within a state to the extent of 50 per cent of the real values of the farms. The money arising from such loans is to be used for productive purposes on the farm on which the security is based. It is contemplated in one way or another, either through separate associations or through a central agency, that debenture bonds may be blanketed on the mortgages and offered to the public. It is proposed that the operations of the system shall be supervised by a central agency in Washington and that there shall be adequate safeguards in the way of examination and inspection. It is thought by students of the question that such debenture bonds would be safe, would attract capital, and would bring into the investment field especially smaller holdings scattered through the country which do not now easily find satisfactory investments. A plan of this kind, operating through private funds, should work safely and would probably result in a short time in systematizing credit transactions in rural districts and in reducing the rate of interest.

The office of markets and rural organization has continued its study of rural credits. Information bearing on farm-mortgage loans has been secured from two-thirds of the savings banks, trust companies, and state and private banks in the United States. The estimated total of farm mortgages held by these banks as loans exceeds $930,000,000. This fund is very unevenly supplied. Iowa banks alone furnish nearly 100 millions. Illinois and New York approximate 85 millions each, California 67 millions, and Missouri 58 millions. In Indiana, Vermont and Minnesota the sum in each exceeds 45 millions. The total of farm mortgages held by these banks in the ten states of the cotton belt is approximately the same as that held by Iowa banks.

Bankers in many states, especially in the Middle West, furnish almost as much money for farm loans, through their activity as middlemen, as they do through loans from their own bank funds. In such cases the banker acts as an agent, usually for some insurance company, mortgage company, or other bank. It is estimated that approximately $565,000,000 is thus handled through members of state, private and savings banks and trust companies.

Information secured from insurance companies shows that more than $600,000,000 of their funds are invested in farm-mortgage loans. While mainly confined at present to the corn belt, these investments are being extended into the South and West. The companies have trained field inspectors or rely upon the statements or guaranties of local agents as to land values. Insurance companies usually limit their loans to 40 per cent of the value of the security and to a fixed maximum per acre. The prevailing period of such loans is five years, with the privilege of prepayment on interest dates.

The business of existing mortgage companies in the United States is often that of agents or brokers who bring borrower and lender together and render other services connected with mortgage loans without assuming liability. Such business can be built up with very little capital. The mortgage is made out directly to the lender, who assumes all responsibility. It is evident that the market for such loans is restricted to investors who know the nature of the security, who are willing to lend the particular amount desired, and who will assume all risks.

A limited number of companies deal in mortgages as a jobbing or merchandise business. The mortgages generally are sold after suitable investors have been found. A few of these companies retain ownership in a portion of the mortgages, deposit them with a trust company, and issue debentures secured by the mortgages as well as

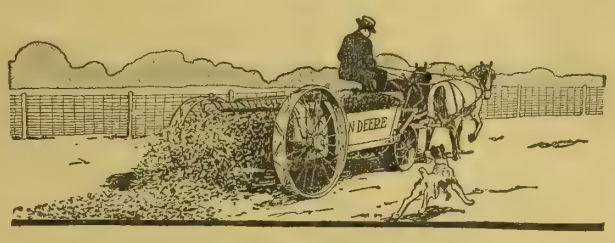
John Deere Implements



John Deere Spreader

The Spreader with the Beater on the Axle

The beater—the business part of the spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You can't get it on any other spreader. The beater on the axle means there are no clutches to give trouble, less than half the parts heretofore used on the simplest spreader, big drive wheels and a low down spreader without stub axles. Only hip high to the top.

Write for more facts. Also ask for "Farm Manures and Fertilizers", a valuable textbook you can get free.

John Deere Wheel Plows

With Quick Detachable Shares
Unscrew One Nut—That's All

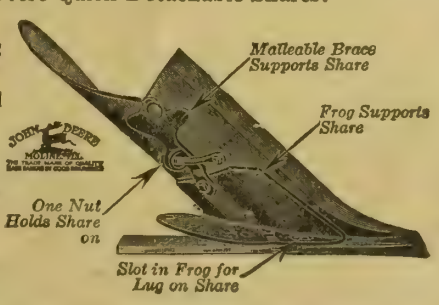
John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

Here are some advantages of these shares:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang (High Lift Frame Plows)
John Deere Stag Sulky and Gang (Low Lift Frameless Plows)
John Deere Two-Way Sulky (Side Hill or Irrigated Land)
John Deere Engine Gangs (For Traction Engines)



Mention the booklet above that you want and we will send it to you free.

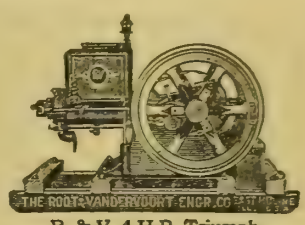
R. & V. Gasolene Engines

New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

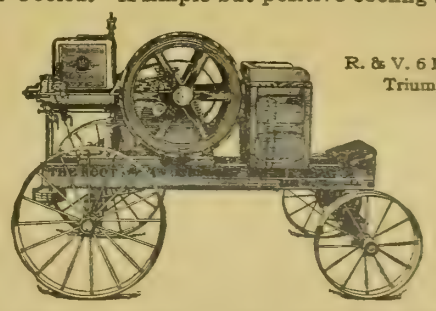


R. & V. 4 H.P. Triumph

They are dependable gasolene engines—always develop rated horse power.

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

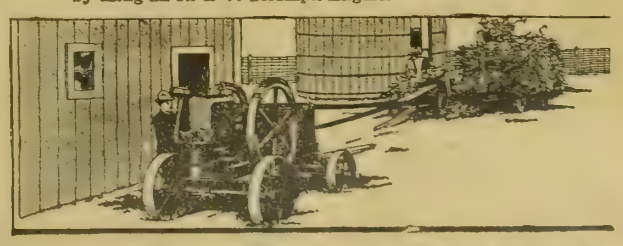
Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.



Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X-111.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

FARM PICNIC

Saturday, April 24, will be the date of the annual university farm picnic at Davis. The management is urging the exhibition of live stock from all sections, and it is predicted that the live stock parade will make a great showing of pure bred animals. Of course there are to be track athletics, races, and, as usual, the tables under the willow trees loaded with lunch baskets.

SEPTIC TANKS

Farmers who are making disposal of the sewage in their septic tanks should write Agricultural Experiment Station, College of Agriculture, Berkeley, and ask for Bulletin 251, "Utilization of Nitrogenous and Organic Matter in Septic Tank Sludge." This bulletin is written by Profs. C. B. Lipman and P. S. Burgess, and while no information as to construction is given, enough appears in the bulletin to show how valuable such a tank may be and how the wastes may be utilized.

WATCH OUT

An Eastern farm paper calls attention to the fact that some designing politicians have their eyes on the farm bureau. The impression seems to obtain that it would be even better than a ward political meeting as a starter of things. The paper then calls attention to the fact that the farm bureau has too much opportunity for bettering farmers' interests to be destroyed by politicians. We believe there is no hint whatever that California bureaus will be used by any designing people. The farmer may well work in harmony with the politician, but the politician working in "harmony" with the farmer is not always so helpful.

REDUCING SQUIRREL PEST

In a publication of the national health service reference is made to the campaign against ground squirrels in California and to reports that in this state in a little over a year the campaign was conducted over an area of 3,373,146 acres. The average cost of squirrel control over this area was 17.4 cents per acre and the average number of squirrels killed per acre 6.5. The campaign resulted in the killing of about 90 per cent of the squirrels, or in other words, nearly 22,000,000 squirrels "have passed away."

From blanks which were sent to producers many returns were received, and from a mass of these we take some interesting points. For example, on one area of 150,840 acres 2,163 more cattle were pastured than when it was infested by ground squirrels. Reports from 21 irrigators showed a saving of $2,331 in repairs on irrigation canal banks. The greatest saving was reported by orchardists owning trees recently set; here the saving was beyond computation.

CROP REPORTS

The day will come when the state or cooperative marketing organizations will secure for the information of the growers more complete reports as to fruit products on hand at the beginning of a season and as to the promise for the coming crop. Of course the cooperative organizations are working along that line, and all to the advantage of the producers, but the information should be even more complete and we believe will be. Meantime we trust the columns of the Cultivator will be used to spread information regarding the apricot, peach and other fruit crops in every section of the state. We ask subscribers to aid us in this campaign and give us by next mail an idea as to the crop in the orchard or the section or the county in which the subscriber lives. It will be of value to fruit growers in other parts of the state.

In this connection it may be in order to refer to the fact that in Texas an estimated shortage of 80 per cent in peaches is predicted because of late frosts.

IMPORTED MEATS

It seems to be an everlasting fight for the consumer to secure the article for which he pays. On this page we have referred to homogenized or manufactured cream foisted upon the purchasing public. Along the same line it is said that the blocks of our meat shops are engaged in working off on the public a meat other than the public supposes it is purchasing. On this point we quote from the annual address made by former President Jastro of the American National Live Stock Association at its recent meeting in San Francisco:

"The foreign meat imported during 1914 was permitted to enter the regular meat houses and was sold in the various retail shops the same as our domestic meats, with nothing to indicate whether it was the foreign or the home grown product. The foreign meat is of an inferior quality and was consequently sold at wholesale at a lower price. Whether the consumer bought it cheaper is an open question. The probabilities are that the average consumer did not know the difference. If the general public is to derive any benefit whatever from the free importation of foreign meat, it must be sold in competition with the native product, and the only way to encourage and sustain that competition is to compel all those who handle imported meats to put up a placard notifying the public of that fact. Then both the foreign and our domestic meat will be sold on its own merits, and the consumer will have a fair chance of getting what he pays for. And to prevent any deception on the part of the retailer all foreign meats should be plainly marked, showing where they came from, when inspected, and by whom.

NINE YEARS AFTER

The management of the Panama-Pacific Exposition is planning for a great "Nine Years After" celebration on the ninth anniversary of the great fire in San Francisco. From the proclamation announcing the event we quote:

"The new city has arisen in its reconstructed greatness to the proud distinction of offering to the world its greatest international exposition at a time when the dreams and ambitions of those Argonaut fathers are being realized through the linking of the two great oceans; whereby the commerce of the world is brought to our doors. We therefore deem it fitting to celebrate appropriately the 17th day of April as planned under the auspices of the Panama-Pacific International Exposition, the crowning achievement of San Francisco's greatness.

"It is further fitting and proper that the succeeding day, April the 18th, be dedicated as an occasion for expressing to Almighty God thanks for the gifts that have been with such bounteous hand showered on the new and old city"

MANUFACTURING CREAM

Dairymen of Southern California are making a fight to give to the consumers of cream in Los Angeles what they are paying for. The statement has been made that Southern California is producing more cream and milk than the city can consume. The dairymen show that this is not true because of the fact that ice cream manufacturers and others in the city import from eastern sections low grade butter and low grade powdered skim milk and from this combination make a substance which they call cream. One large concern which manufactures from 2000 to 3000 gallons of ice cream daily buys less than 30 gallons of cream. In fact we believe the ice cream manufacturers admit that their ice "cream" is nothing more nor less than a manufactured cream from milk and melted butter. Of course on analysis this stuff shows the proper content of fat, which makes a situation somewhat embarrassing to the state dairy bureau and the local board of health. But if the public is entitled to pay taxes to support its proportion of the state dairy bureau and to maintain a local board of health, it is also entitled to protection by these bodies from having foisted upon it inferior stuff in the name of cream. It is time the public spoke in no uncertain terms.

This is written from the standpoints of both consumer and producer. We have many times referred to the use of cottonseed oil in the place of olive oil. It is dishonest, and the consumer is protected by the federal government, for even if cottonseed oil is a healthful food, it is not satisfactory to the consumer to pay olive oil prices for it. Unfortunately in the Southern California dairymen's case the federal government has no jurisdiction.

We hope there will be strength given to the arm of the new association and that it will see that the consumers are given the pure product for which they are paying, and that the dairy industry of Southern California will be encouraged.

Agricultural Notes

Several carload shipments of grapefruit were made in bulk this season from Florida to Philadelphia. The fruit arrived in good condition.

The government encouragement of sugar beet growing in England is widely advocated. Seventy-five per cent of her sugar imports came last year from Germany and Austria.

Congress has granted an appropriation to secure two new vessels for the use of the coast and geodetic survey in its work of survey to safeguard navigation on the Pacific coast, including Alaska.

Imports of fresh fruits into Colombia from the United States are steadily increasing. Apples in quantity are double all other fruits. Those preferred are Ben Davis and Winesaps packed in barrels.

To market the coming orange crop the Texas Fruit Growers' Association was organized last week at Houston at the meeting of the Citrus and Fig Growers' Association. It is to be a stock company. Operating plans will be made at an early meeting.

There is a demand in Russia for American seeds. Russia formerly received most of its seed supply from farms in France, Belgium, Germany and Austria. As many of these farms have been destroyed they cannot furnish seeds for sometime after the war is ended.

Vladivostok in Siberia will be made a port of call by the Great Northern Steamship Company. The first steamer sailing under the new schedule leaves Seattle on May 20. Large shipments of foodstuffs, cotton, steam shovels, automobiles, machinery, and other merchandise are being booked for the voyage.

Motion-picture theaters, or "cinematografos" as they are called in Paraguay, constitute the only form of amusement in Asuncion Though this form of entertainment has been but recently introduced, there are five motion-picture theaters now operating in Asuncion, and there is talk of opening others. American cowboy films are very popular.

The proposal has been made recently that tussah silk should be used in place of khaki for English soldiers' uniforms. A khaki cloth composed of tussah silk warp and worsted weft was made, and the war office approved samples submitted to it. An order was given for the clothing of a battalion of the Yorkshire regiment with the new cloth. The view was expressed that the material was of ideal quality for use by colonial troops. It is comparatively little dearer in price than woolen and worsted khaki, and its greater wearing qualities have been vouched for.

The Egyptian ministry of agriculture has just published a bulletin dealing with the prevention of the reinfection of fumigated citrus trees in that country. It is pointed out that reinfection comes to a very great extent from scale insects left on dead leaves and fruit lying on the ground near by the trees. Two important rules are deduced: Orange trees should have all their lower branches pruned off, and should have bared trunks for the first 50 or 60 centimetres above the ground; it is absolutely necessary to keep the ground near by the trees free from dead leaves and fallen fruit. The interlacing of branches should be prevented also by judicious pruning.

Agricultural News Notes of the Pacific Coast

Northern California

Pear orchards of Placer County are seriously infested with red spider.

The largest almond shelling plant in the world has been built in Sacramento.

Napa County dairymen met Saturday the 10th to form a permanent cow testing association.

Rice fed stock will be a feature at the Butte County exposition which will be held in Chico the last week in May.

Anti-alien labor bills are still being considered in the state legislature, with little probability of favorable action.

Many tractors have been operated in the grain fields of Yolo County this year to the entire satisfaction of their users.

The first solid car of asparagus out of the state went to New York. Prices range from $5 to $15 per dozen bunches.

The largest rice plantation in California is contemplated in Butte County, where one tract of 2,000 acres is to be planted.

The chamber of commerce of Oroville distributed calla lilies to passengers of the Western Pacific passenger trains on Easter Sunday.

Any owner of farm animals is invited to participate in the stock parade at the annual university farm picnic at Davis on April 24.

There will be a demonstration of best methods of immunizing swine against hog cholera at the farm picnic which will be held at Davis, April 24.

A series of six lectures is to be given by members of the university faculty at Sonoma. The first on April 16 is on landscape gardening by Prof. R. T. Stevens.

Corning, Tehama County, is to have a fruit festival Friday and Saturday, August 13 and 14. It is hoped to have special trains on the Southern Pacific from San Francisco.

A most successful cooperative creamery is in operation at Anderson, Shasta County. In its year and a half of operation it has made nearly 100,000 pounds of butter.

The Yolo County Swine Raisers' Association has perfected its organization. H. L. Huston has been elected president, J. L. Harlan, vice-president and Wm. Gould, secretary-treasurer.

Canneries of Yuba and Sutter Counties anticipate an exceptionally large run. It is now anticipated that 3,000 hands will be required on the payroll as against 2,000 in the same canneries last year.

Yolo County's cow testing association has just published its report for the month of March. It shows 13 cows testing over 55 pounds of butter fat. The cow holding the highest record was a Holstein who gave 80.07 pounds fat in the month.

Wool and mohair growers of Eldorado County expect good prices for their clips this year. Prices last year ranged from 12 to 15 cents a pound. This year the growers are anticipating 18 to 20. The shearing season will start within a few days.

Central California

A new creamery has just opened at Delano.

Tulare is shipping about 80 cases of eggs to Los Angeles weekly.

Turlock, Stanislaus County, is voting on a $16,000 park bond proposition.

Turlock, Stanislaus County, estimates a good fruit crop in that section.

An experimental farm is to be established with private capital in eastern Fresno County.

Kings County has 50,000 acres in alfalfa. It is said to yield the county $1,570,000 annually.

Raisin growers of Kingsburg, Fresno County, have generally signed contracts with the Associated.

The waters of Monterey Bay are yielding up thousands of crabs, which are finding a ready market.

Manager James Madison of the Associated Raisin Company anticipates a good season for all dried fruits.

Lands which were formerly at the bottom of Tulare Lake will yield this year in excess of $9,000,000 worth of grain.

Alpaugh, Tulare County, is planning for a receiving station for separating and cooling sweet cream for Los Angeles shipment.

McKittrick, Kern County, is making its first wool shipments of the season. The wool is going to San Francisco and Boston.

Raisin Day committees are still working for more funds and enthusiastic over a successful observation of Raisin Day, April 30.

Turlock merchants are joining with farmers in the organization of a marketing association which will cover much of Stanislaus County.

The California Ripe Olive Association was recently organized at the Panama-Pacific exposition. J. J. Avis of San Francisco is president.

The Kings County Hog Raisers' Association is pushing for the enactment of a county ordinance which will aid in the control of hog cholera.

Dos Palos, Merced County, on the west side of the San Joaquin Valley, is planting a quantity of Japanese rice on lands heretofore considered of no value.

At the annual meeting of the Alta District Cured Fruit Association near Dinuba, Tulare County, J. W. McPherson was elected president and W. E. Lindley, secretary.

An organization was perfected at Turlock last Saturday with a membership of 140 farmers, the object being to dispose of crops of the members to better advantage.

Owners of 11,000 cows have agreed to supply a cooperative creamery at Los Banos, Merced County. A committee is now at work drafting by-laws and a plan of organization.

James Madison, manager of the California Associated Raisin Company, predicts a successful season for dried fruit producers. He finds from information gathered during a recent trip over the East that financial conditions are generally much better.

Southern California

Southern California claims a registration of 63,300 autos.

About 40 per cent of the navel oranges are yet to be shipped.

Sheep men of the Imperial Valley are planning a material increase in stock.

One planter near Thermal, Riverside County, is planting 20 acres of tepary beans.

Southern California sugar beet planting will probably be fully up to that of former years.

The farm bureau at San Luis Rey, San Diego County, is moving for a cooperative creamery.

At a recent meeting of the Covina Valley Farmers' Club the marketing of oranges was discussed.

County Farm Adviser Weinland of San Diego is making the round of 26 locals of the farm bureau.

The farm bureau of Fallbrook, San Diego County, held an interesting session at the auditorium last Friday.

Garden Grove has shipped this season 24 carloads of string beans, celery, cabbage and chili peppers to Eastern markets.

Imperial Valley is already beginning the cutting of its barley. It will be the greatest crop of grain yet harvested in that valley.

At the recent meeting of the farmers' club at Hemet an address was made by County Horticultural Commissioner Sharpe.

The Winthrop Howland Goat Ranch at Redlands has loaned several fine specimens of milch goats to the state university for use on its farm at Davis.

The Southern California dairymen have organized and their association is endeavoring to secure fair treatment from the milk purchasers of Los Angeles.

A cannery and packing house handling chili, cabbage, and other products of Garden Grove, Orange County, will soon be built on the tracks of the Pacific Electric.

The annual meeting of the Growers' Drying and Canning Company of Hemet, Riverside County, was held recently and directors and officers were elected for the coming year.

Ice "cream" factories in the city of Los Angeles which manufacture from 3,000 to 4,000 gallons of ice cream daily purchase from nothing to as high as 30 gallons of cream from dairymen.

A general meeting of orange growers was recently held at Riverside to discuss ways and means of improving marketing methods. There will probably be no change during the coming season.

The planting of cotton in the Imperial Valley will be less than that of last year, though present prices on Egyptian are such as to encourage increased planting. Much of last year's crop has been sold.

Nearly all of Southern California was visited by rain, in some sections three-quarters of an inch being precipitated. This gives assurance of a big hay and grain crop and is valuable to orchardists as well.

The Coast

Deschutes Valley, Oregon, recently shipped 11 cars of live stock.

A cooperative creamery is soon to be constructed at Chandler, Arizona.

Lands adjacent to Roosevelt Reservoir, Arizona, have been set aside as a national bird preserve.

Arizona has a farm improvement association with delegates or representatives from all sections of the state.

Sheepmen of Montana are jubilant at prices which are prevailing and because of excellent condition of all stock.

The sale of 250,000 pounds of wool was recently made near North Yakima, Washington, at 22 cents per pound.

Native grasses in Northern Arizona are showing the heaviest growth for years. Livestock generally is in fine condition.

Chilliwack, British Columbia, poultrymen, have organized a large utility and marketing organization. The president is H. M. Rutledge.

A great series of celebrations is planned for the valley of the Columbia river to celebrate the opening of the Celilo Canal, May 3 to 8.

The manager of the Utah State Fruit Growers' Association reports shipping during the last year 1036 cars, which went to 32 states.

A farm adviser at Walla Walla, Washington, is planning to wage war on the army worm which has been one of the serious pests of that section.

The Southwestern Cattle Raisers' Association of New Mexico met recently in annual session. An address was made by Prof. Thornber of Arizona.

The farm adviser at Caldwell, Idaho, is urging farmers to make a persistent campaign on hog cholera which has been serious in many sections of the state.

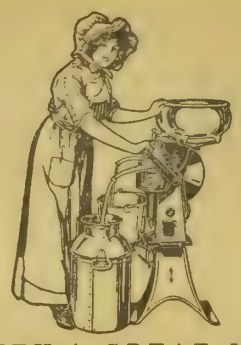
An effort is being made to unite four poultry associations of Polk, Marion, Yamhill and Linn Counties, Oregon, into one large marketing organization.

The Colorado board of live stock inspection has quarantined against live stock shipments into that state from Mexico, Canada and all states excepting coast and mountain.

Fruit growers of Chehalis, Washington, have organized a cooperative canning association. Twenty-five thousand dollars has already been subscribed to its capital stock.

Farmers of Linn and Benton Counties, Oregon, are organizing a cooperative marketing association. It is proposed to sell fruits and vegetables raised by the members, also to make purchases of supplies in large quantities.

At a meeting of live stock sanitary officers representing the states of Washington, Oregon, Idaho, Utah, Nevada and California, it was decided to permit importation of live stock and poultry from Wyoming, Colorado, Texas, Arizona and New Mexico, while maintaining quarantine on all other states.



Which will you buy

a "cream thief" or a "savings bank" Cream Separator

WITH A GREAT MANY machines or implements used on the farm it doesn't make much difference which of several makes you buy.

ONE MAY GIVE YOU A little better or longer service than another, but it's mostly a matter of individual preference and often it makes little difference which one you choose.

NOT SO WITH BUYING A cream separator, however.

THE MOST WASTEFUL MAchine on the farm is a cheap, inferior or half worn-out cream separator.

THE MOST FROFITABLE MAchine on the farm is a De Laval Cream Separator.

A CREAM SEPARATOR IS used twice a day, 730 times a year, and if it wastes a little cream every time you use it it's a "cream thief," and an expensive machine even if you got it as a gift.

BUT IF IT SKIMS CLEAN TO the one or two hundredths of one per cent, as thousands and thousands of tests with a Babcock Tester show the De Laval does, then it's a cream saver, and the most profitable machine or implement on the farm—a real "savings bank" for its fortunate owner.

AS TO HOW MUCH CLEANER the De Laval skims than any other separator, the best evidence of this is the well-known fact that all other makes were discarded by the creamerymen years ago, and that today 98% of the cream separators used in creameries the world over are exclusively De Lavals.

THEN THE DE LAVAL IS SO much better designed and so much more substantially built and runs at so much lower speed than other separators that its average life is from 15 to 20 years, as compared with an average life of from 2 to 5 years for other machanes.

THERE ARE OTHER ADvantages as well, such as easier turning, easier washing, less cost for repairs, and the better quality of De Laval cream, which, when considered in connection with its cleaner skimming and greater durability, make the De Laval the best as well as the most economical cream separator.

REMEMBER, THAT IF YOU want a De Laval right now there is no reason why you should let its first cost stand in the way, because it may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

A De Laval catalog to be had for the asking tells more fully why the De Laval is a "savings bank" cream separator, or the local De Laval agent will be glad to explain the many points of De Laval superiority. If you don't know the nearest local agent, simply write the nearest De Laval main office as below.

De Laval Dairy Supply Co.

Live Stock and Dairy

THE SWILL PAIL CROSS

Written for California Cultivator
By Sacramento Valley Contributor

THERE is an old gentleman in the Sacramento Valley growing oranges who farmed in Iowa years ago. In those days hogs sold for two cents a pound or less and all farm produce was very low in price, making good farming practice even more essential to profit making than it is now.

In one lot that he had to market there were 10 hogs. A neighbor sold 30 at the same time. The neighbor's hogs were of the same age, but the 10 brought more money than the 30 head, not because they brought any more per pound but because they weighed more.

The neighbor was very much worried about it and thought there must be some difference in the breed and that his were inferior.

So when the next litter of pigs were big enough to wean the neighbor exchanged pigs to see if this notion of breed made any difference. Pigs that were just good average representatives from the two herds were taken, and at the time the trade was made there was no apparent difference in the individuals.

It was the custom on these two farms at that time to grow hogs until they were nearly two years old, and at about that time the two pigs were compared. The one that was raised and fed by the good hog feeder was the largest one in his lot, weighing over 600 pounds, while the one he had exchanged for it was not quite as good as the average of the other lot and weighed but a little over 200 pounds.

In commenting on the incident the old gentleman says "There is more in the "swill pail cross" with hogs than in breed, and no matter what breed a hog may be it must have good feed and plenty of it during all of its life, if it makes the gains it should."

There is much for the average Californian to think of in this connection. Feed is a big factor in pork making, and there are many hogs that do not weigh 200 pounds until they are 12 or 15 months old that could just as well make that weight four or five months earlier if they had all of the good feed they could consume from birth to slaughter time.

In the life of the hogs raised by the good hog man there were no "fat and lean" periods—they were all "fat." His hogs had all the feed they needed every day and a good place to sleep. The neighbor who was looking for a better breed was not as careful to plan his feed supply, and between harvests there were times when the hogs had to "get out and rustle on the prairie" for a living. At such times they lost a part of the flesh they had put on during the "fat" period of plenty of grain. The good feeder always had grain in the bin so as to avoid the "thin" periods in the life of his hogs, and there was always some good feed soaking in the "swill barrel."

GOATS IN THE ORCHARD

Written for the California Cultivator,
By B. A. R. Stocker

In the American Standard Milch Goat Keeper appears a description of a method of tethering goats in orchards—so simple, so effective, each of us might have thought of it but probably didn't. Rev. D. C. Mayers of Virginia thus describes it:

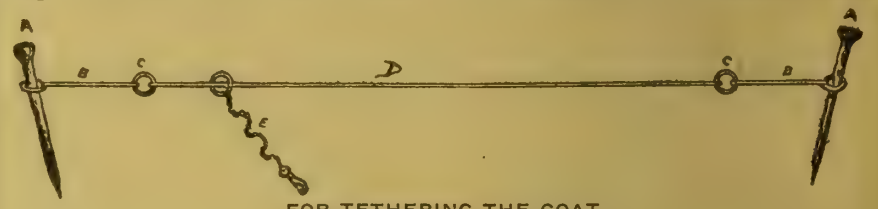
"Where free grazing is not possible I adopt a very practical method of tethering the goat as shown in the accompanying illustration.

"A-A, iron stakes four feet long to be driven two feet into the ground.

"B-B, pieces of No. 8 galvanized iron wire four feet long attached to the stakes firmly at one end to

"C-C, rings at the other end, rings to be about 1½ inches in diameter.

"D, length of No. 8 galvanized wire



FOR TETHERING THE GOAT

any number of feet desired, 20 feet is good, joining rings C-C.

"E, heavy chain, costing about 25 cents each with swivel to be fastened permanently on d,—and a small bar and ring to fasten around the goat's neck. I do not use a collar, and so I minimize the danger of the goat getting loose, for if she does she will work great havoc with shrubbery.

"This method prevents the goat from getting her tether entangled around a single stake, and she can be made to graze a strip three feet wide or 30 feet wide. I use this method in grazing between rows of an apple orchard, moving the stakes alternately down the rows running north and south and then east and west."

With this outfit every orchardist could keep a couple of milch does helping to make humus among his trees for a good many hours each fine day and providing his family with the best milk in the country. They would need little else but an enclosure and shelter where they could be turned loose the rest of the time and some hay and grain for wet weather. The ordinary picket pin is notoriously unsatisfactory to use with goats in or out of orchards.

TAIL RUBBING

Answering several inquiries as to "Tail Rubbing" we quote from a former Cultivator:

Tail Rubbing is sometimes caused by parasites lodged within the rectum. The grub of the red-tailed bot fly (Estrus hemon rhoidalis) hook themselves to the lining of the rectum and two kinds of round worms are known to infest this part. Externally the skin of the tail may be irritated by mange parasites, mites, or eczema. Oil the hand and insert it into the rectum

and search for bots or grubs. Remove the hand and look it over carefully for small round worms. Bots must be picked off with the fingers. For rectal worms inject a gallon of warm water in which a plug of tobacco has been steeped for some hours. Failing to find the cause within the rectum examine the skin of the tail by scratching several places, watching the lips of the horse at the time. When the spot which itches is reached the head will be turned and the lips worked, showing a desire to assist in the scratching. Treat by washing thoroughly with warm water and soap; dry; and apply a mixture of Eucamphol one part, water four parts.—F. G. M."

A GREAT SALE OF HOLSTEINS

Announcement is made in another column of the coming sale of pure bred Holsteins which will take place at Ascot Park, Los Angeles, May 12.

Referring to this sale J. W. McAlister writes us that it will be the greatest ever held on the Pacific Coast. In fact, we quote from his letter as follows:

"In connection with this sale I wish to say that I believe it is the greatest event of its kind ever held on the Pacific Coast. Certainly no such high record cows as White House Belle, with a record of 29 pounds of butter in seven days, as well as a dozen or so of her sisters, and Alba Sadie Cornucopia Creetia, with a record of 28.85 pounds butter in seven days, have ever been offered at public sale west of the Rockies. The cattle are bred in the highest lines and include daughters and granddaughters of many of the most famous bulls of the breed, including Sir Sadie Cornucopia, son of the first 30-pound cow; Rag Apple Korndyke 8th, the $25,000 bull; Pietertje Hengerveld Segis, son of the famous King Segis and the 33-pound cow, Blanche Lyons De Kol; Sir Fayne Concordia, and others of equal note.

"They are as good individually as they are bred and include the third prize three-year-old at the National Dairy Show at Chicago, 1910, and the first prize calf at the Colorado state fair, 1914. A noteworthy feature of the sale is the fact that about 20 cows and heifers are bred to Tilly Alcartra's son, the junior herd sire of McAlister & Son, and the greatest bred bull of the breed. Tilly Alcartra's son is out of the world's champion milch cow, Tilly Alcartra, the only cow to produce over 30,000 pounds of milk in one year on semi-official test, and is sired by the bull that combines the blood of the world's champion generation of cows from three to six generations.

"The bulls offered are, I am convinced, the best bred lot, as well as the best individuals ever sold at public sale in California. McAlister & Son, having recently purchased the famous Merci Ranch herd, are consigning their herd bulls, which include a three-year-old son of King Segis Pontiac Emperor, senior herd sire of A. W. Morris and Sons, out of a 20-pound four-year-old daughter of Juliana King of Riverside, the greatest A. R. O. sire ever produced in the West; a two-year-old son of King Pontiac Artis, son of the famous King of the Pontiacs who now has 126 A. R. O. daughters, from Pontiac Artis, the famous 31-pound prize winning daughter of Hengerveld De Kol and out of a good record daughter of Prince Hengerveld De Kol, who contains 75 per cent same breeding as Hengerveld De Kol—116 A. R. O. daughters; a two-year-old son of Pontiac Hengerveld Parthenia, best son of Hengerveld De Kol and sire of the former world's champion 30-pound four-year-old, and out of a daughter of Sir Korndyke Manor De Kol, sire of three 30-pound daughters. Among the younger bulls are a son of De Kol Hengerveld Burke, sire of two 30-pound daughters, a grandson of King of the Pontiacs—a son of the cow that sold for $625 at the Hanford sale—as well as two young sons of the 28 and 29-pound cows to be sold in this sale, and a few other splendidly bred bull calves.

"Mr. Schumacher has spared no expense in getting together one of the greatest herds of foundation cows ever brought into the state and has spared no expense in breeding and developing it, as is shown by the fact that so many are in calf to Tilly Alcartra's son. Only the unalterable decision of his partners to dispose of the ranch has decided him to sell this fine herd at auction. This is the first time a sale of registered cattle has ever been held south of Tehachapi, and while he does not expect to realize what he paid for them, it is to be hoped that the quality of the stock will be appreciated by lovers of fine dairy cattle. The outlook of foot and mouth disease in the East and Middle West will prevent any cattle being brought into the state for a long time. This sale will be the only opportunity for many months for those looking for better quality of registered Holsteins to buy them at their own price."

SALT LIVE STOCK REGULARLY

Written for California Cultivator
By Sacramento Valley Contributor

Stockmen have known for ages that animals require salt for their best health and development, and recently at an experiment station it has been shown that stock receiving salt regularly make larger and more profitable gains than do those from which it is withheld.

Through plain carelessness and neglect animals on many farms go without salt for weeks, sometimes for months. On others every Sunday is salt day, and such a small allowance is given that everything runs greedily for it and it is all licked up in a jiffy.

Others make this Sunday salting of sufficiently generous proportions to do the stock for the week if—as frequently happens—something does not happen to prevent it—and the job goes over for twice or three times the customary period and the stock become very salt hungry.

The best plan for salting is to provide either rock salt or salt in boxes that are easily accessible at all times. For horses and cattle this box can be fastened securely to a post or building so as to keep it free from dirt; for hogs and sheep it must be on the ground and should be a solid, substantial trough made of plank.

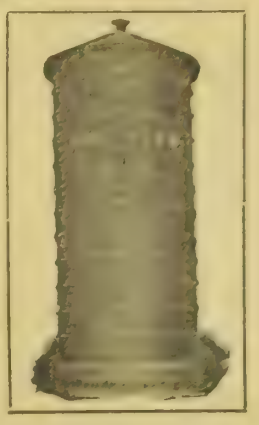
For hogs a good way to provide salt is in a mixture of lime, ashes and salt, and unless one has been feeding this the amount of it consumed from week to week will be a surprise.

There are some vegetable salts that have great health giving powers, both for human and other animals. The potato contains a high percentage of the salts of potash and phosphorus which probably have a good effect in counteracting acids in the alimentary canal. At any rate the potato is considered by medical authorities as being very beneficial to health because of this salt content.

And it is claimed that the spineless cactus contains a large per cent of vegetable salts of great value as a digestive agent and as a food.

Every offender who is guilty of "no salt" or "not enough salt" against his animals should try to live for a few days on unsalted food, then make permanent salting places and see that they are always kept filled.

THE IDEAL GREEN FEED SILO



A practical piece of dairy equipment.

SUPERIORITY AND EFFICIENCY count for as much in a silo as in a cream separator.

A CHEAPLY CONSTRUCTED or improperly designed silo is a waste of money. It is even worse than none at all, for it is usually a source of loss, in spoiled feed.

THE IDEAL GREEN FEED SILO is of proper design, material and workmanship, and will return as good ensilage every pound of good feed put into it.

YOUR SUCCESS in the use of an Ideal Green Feed Silo is highly important to us, for we sell everything a dairyman will need, and we want you to succeed.

THE IDEAL GREEN FEED SILO is a practical piece of dairy equipment.

REMEMBER a cheap silo is even worse than a cheap separator.

Milk of the Holstein

Written for California Cultivator By J. W. McAlister, Secretary California Holstein-Friesian Association

QUALITY of the milk of the different dairy breeds has lately received a great deal of attention. It has been said by some of the highest dairy authorities that the low percentage of fat in Holstein milk was the breed's weakest point, while on the other hand the high percentage of fat in Jersey and Guernsey milk has been the most substantial "talking point" of those breeds. Granting that this may be true, yet Holstein milk has a much higher value than is usually credited to it.

Analysis of 2400 different samples of milk, as reported by the Vermont experiment station in its report for 1890, show that a high percentage of fat is not accompanied by a corresponding rise in the other milk solids as shown by the following figures:

Per cent Fat	Per Cent Total Solids	Per cent Casein	Per cent Milk Sugar and Casein
3.07	11	3.92	5.01
3.50	12	3.07	5.43
3.99	13	3.30	5.71
4.68	14	3.57	5.75
5.38	15	4.00	5.62
6.00	16	4.30	5.70

The official lactometer tests on 413 Holstein cows on yearly test show an average percentage of fat of 3.41 and an average percentage of total solids of 11.96. The average pertenage of fat of all the Holstein cows on yearly test is 3.45 so that the average percentage of total solids will probably be about 12.00. This agrees with the bureau of animal industry investigations in bulletin No. 156 in which the general average of all the experiment station tests is given:

	Average per cent fat	Avg. per cent total solids	Avg. per cent protein	Avg. per cent sugar
Jersey	5.14	14.70	3.80	5.04
Guernsey	4.98	14.49	3.84	4.98
Ayrshire	3.85	12.72	3.34	5.02
Holstein	3.45	12.00	3.15	4.62
Shorthorn	3.63	12.57	3.32	4.89

In this instance the average percentage of fat agrees so nearly with the average percentage of fat of all the cows in each breed tested for yearly production that the average percentage of total solids may be set down as approximately correct for each breed. The Jersey thus in average percentage of total solids, as well as average per cent fat, leads the list, but the quantity of milk yielded by Holstein cows is so great that when total production is taken into account the breeds are placed about in inverse ratio. It is interesting to note that while Jersey milk tests 1.69 per cent more than Holstein milk, there is only a difference of 2.70 per cent in the matter of total solids.

For feeding purposes to young stock low testing milk has probably an advantage over rich milk, as proven by the Connecticut station in an experiment on pigs. The pair receiving skim milk gained 72 pounds in 30 days; the pair receiving poor milk, 58 pounds, and the pair receiving rich milk 50 pounds. The pigs receiving skim milk required 1.48 pounds of total solids for 1 pound of gain; the pair receiving poor milk, 1.40; and the pair receiving rich milk, 1.56 pounds.

Probably the point of most dispute is the relative value of rich or poor milk for infant feeding. At first the adherents of rich milk were inclined to ignore the claims of superiority for poor milk, asserting that all milk had to be modified before it could be fed to infants, and as only a very small fraction of the milk is consumed as such, the matter was of no significance. Lately, however, the Jersey Association has issued several pamphlets trying to prove wherein Jersey milk is the best for infant feeding, and the subject has again assumed considerable importance. The researches of the different medical authorities however, together with the testimony of several of the different agricultural experiment stations has been to the effect that on the whole low testing milk is the most valuable for all those with weak digestion, and the use of rich milk on such cases is gradually passing into discard.

WHITE HOUSE BELLE
Highest Record of Any Cow Ever Offered for Sale in West. Her Record of 29.27 pounds of Butter in 7-day Test.

INSECT PESTS DESTROYED BY SHEEP

That many insect pests are protected by useless vegetation along ditch banks and lanes, and that the insects may be destroyed and the undergrowth may be turned into valuable mutton and wool, are facts not generally realized by farmers. Pasturing of a flock of sheep in these places is a most valuable measure for destroying great numbers of insects that might later spread to and breed in adjoining fields of grain. Where weeds are outside a fence, or where no crop is growing in the field, pasturing sheep in summer will of course keep down the fall crop of insect-harboring vegetation.

The amount of land covered by useless matted vegetation growing along ditch banks, fences, and roads is of no small extent. This land as a rule can not be burned over because of the danger to fences. Besides much of the common grass thriving in such localities is always too green to burn and serves to protect the thick mulch of dead grass that accumulates beneath from year to year and forms an ideal refuge for all manner of pests. A small flock of sheep, given the range of fields and roads and where there are no growing crops, will dispose of nearly all useless vegetation. Only a little grain need be added to fatten them. If the farmer does not wish to keep the sheep permanently he may often purchase "feeders" in carload lots at the large stockyards when they are just in condition to be fattened and later dispose of them. By herding the sheep along the roadsides and properly shifting them about according to condition in the fields, all of this waste ground can be made to yield a return to the owner, and incidentally add to the value of the farm.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Feeding Apricots

Are apricots harmful to pigs? I fed them to a pig last year and he did not do well. Don't know whether the apricots were the cause or not. I soaked the fruit, pit and all, about 12 hours before feeding.—Subscriber.

Apricots are so seldom used as feed for hogs that there are no records of their effect, but one would suppose that the pits might clog the bowels and might cause death. A few apricots mixed with other feed might be all right.

Bony Growth

Mare has hard lump, size of half walnut, on the inside of front foot, on the lower part of the pastern. It is not sore and does not make her lame. What can I do to remove it?—Subscriber, Del Rey.

Rub the enlargement hard with a round stick every day and apply an ointment made of iodine crystals, one dram; tincture of iodine, two ounces, and lard, two ounces.

To Remove Scar

My driving mare has a scar on her right hind foot which is quite bad, caused by a barb wire cut made nearly two years ago. There is one bad blemish just above the hoof, but none in the hoof, then a smaller one above this on the pastern joint, which makes her carry this leg somewhat stiffly, and she does not travel as well as she should. They are also on the outside of the foot and pastern and look very bad. Would you please tell me if there is anything I can do to reduce them. Would blistering or caustic potash do any good?—Subscriber, Del Rey.

Scars of so long standing are hard to remove. The enlargement must be cut out and the edges brought together with a bandage. Only a veterinarian of some experience can treat such a case successfully. Blisters will have no effect.

Pin Worms

I have three colts affected with worms. They are small, white worms and seem to start from the rectum alive. The colts rub their tails and mash the worm, which leave a white substance around the rectum. Colts have had green feed most all winter, but have been fed barley straw, kafir fodder and kafir corn.—Subscriber, Moreno.

The worms that you describe are pinworms and inhabit the rectum and large bowel. The eggs from which they hatch are taken in with the water or feed from low lands. They are best gotten rid of by injecting tobacco tea. Steep a paper of scrap tobacco in three parts of water. Strain the solution and inject it warm, but not hot. This should be repeated once a week until three or four treatments have been given. Worms are usually found in animals that are overfed. Reduce the feed and give the following powders to improve the digestion: Powdered gentian, eight ounces; powdered nux vomica, four ounces; sulphate of iron, four ounces; bicarbonate of soda, eight ounces, and enough farina to make three pounds. Mix and give a small tablespoon once a day. Also see that the colts get plenty of salt.

The Selection and Care of the Herd Sire

By H. G. Armstrong, President California Swine Breeders' Association

A CLAIM that success in the hog business depends upon the proper selection of the boar may not be wholly correct, but many failures in the business are certainly due to the sire.

No matter how good the matrons of the herd may be, if the sire is poor and inferior, the resulting stock is very liable to be poor. But if the boar is what he should be, the pigs will be good, even though the sows are rather inferior in quality. Those familiar with the principles of breeding know that the male, if more prepotent than the sows, will sire pigs which resemble him very closely in outward appearance. If this then be true we can easily see how much depends on the proper selection of the sire. There is an old saying that the sire is half the herd. He is more than half. He is half the first generation, three-fourths of the second, seven-eighths of the third, and so on. If this is carried on indefinitely the character of the herd is fixed by the sire alone.

In selecting the sire always if possible take the older boar rather than the one three or four months old, even though he cost more, as he will, for oftentimes the young pig does not grow out as well as his appearance would lead us to believe. If possible when making your selection see the herd from which he comes. If the herd is uniform in type and quality and he is a good feeder, then the boar should be a good breeder. By all means he should be a good breeder. By all means he should be chosen with reference to the sows se is to be used on. If the sows are deficient in any one respect then select the boar that is strong there.

He should in all cases be pure bred of whatever breed you most prefer. Under no circumstances use a boar of mixed breeding, for this is a step backward rather than forward. If a Berkshire cross is preferred then use a Berkshire boar of known ancestry. The same thing applies to the Polands or any other breed that you might prefer.

Among some of the characteristics that he should have the following might be mentioned: A good head with round, heavy under jaw; a thick, short neck which indicates vitality; a large heart girth with plenty of room for large lungs, and width between the forelegs; ribs should be well sprung, with good stomach capacity. The skin should be soft and elastic, covered with soft hair. He should stand on good feet with small joints. Above all he should have plenty of masculinity so that if you should see his head through a fence you would not mistake him for a sow. Such a boar cannot help but put his stamp on his progeny and he will be cheap at almost any price. Prices of such stock will vary a little in different localities, also some according to breed, but buy him anyway.

Next to the selection of the sire is his care afterwards. The mere fact that you have bought a good individual at perhaps a good price does not mean that when you get him home you can secure desirable results from him if given indifferent treatment. If he was worth buying in the first place he is worth all the care and attention he should have afterward. As mentioned before success in the hog business depends a great deal on the sire, and the success you have with a good sire depends entirely on his care and feed.

Do not shut the boar up in close, cramped suarters where he can receive very little or perhaps no exercise. This will tend to fatten him, which, of course, may produce lowered vitality and prepotency. Give him instead a small lot, an acre or so will do, seeded if possible to alfalfa or some other pasture, with his sleeping quarters in one end and his feed trough in the other. This will give him his needed exercise. Do not turn him out to range at large with other stock where gilts and sows are running. He will fight the stock, maybe ruining himself as a breeder, and he will worry and fret until he will soon look little like the individual you first bought. He will also become breechy and hard to handle and in some cases almost dangerous. Close confinement is better than the above mentioned, for he can be taken out and exercised regularly.

Keep him in his own lot and when his services are needed bring the sow or gilt to him. Let him serve her once, for once is as good as a dozen times, then remove the sow to a quiet place away from other stock. One service a day is enough for a mature boar, though in the busy season he may be used twice a day, provided, of course, he is properly fed. This brings us to the feeding question.

The boar should always be in good, thrifty condition, neither too fat nor too lean. We, as a rule in our own herd, like to keep our herd sires in such condition that if they were barrows they would make good pork. Dry feed alone, usually in the form of grain, will not put or keep him in the best possible condition any more than will a weak slop. In general we feed our sires much the same as we do our sows, with a few minor exceptions. If the boar is young and growing he should be fed enough protein for this purpose. If he is mature only enough protein is needed for maintenance. The rest of his feed may be composed of cheaper feed with more bulk to it. When in active service, however, we like to feed more protein than the maintenance ration, as this tends to stimulate the glands. We also feed more carbohydrates, as this is needed, for more energy is expended by a boar in service. This method of feeding in our own case we believe responsible for our large litters, eight pigs or better being the average for young sows and gilts sired by a young boar just coming into active service, and in the condition we have mentioned above.

If the same person handles the boar all the time, and his quarters are isolated from other stock, you will find that he will usually be quiet and gentle. More depends on the treatment given him than on his natural disposition as to whether he is docile or not. Do not allow strangers to annoy him. We never bother our own sires, so that when we speak to them they usually know that we want to use them, and oftentimes they will follow us by calling. It is a good practice, however, to keep the tusks cut off, so that the chances of getting injured are materially reduced.

Another subject that we might mention at this time is the age at which a boar should be put into active service. Opinions vary some on this subject. We have known people who have bought boar pigs from us to start using them as early as six months. This is too young and will invariably stunt them and may even ruin them as breeders. Inmature sires generally do not get so large and healthy litters as do mature ones. In some exceptional cases a boar might be used at eight months, and then only sparingly. In our estimation a year old is soon enough. Then he should be used only moderately. A boar is most valuable as a breeder when from two to five years old. If handled as we have suggested he will be little if any harder to manage at five than he is at one year. Invariably the aged sire produces the best litters. Most sires, however, are not kept that long, being disposed of long before they have proven themselves good breeders.

Poultry for Profit

HINTS ON GOOSE CULTURE

By Helen Dow Whitaker, State College of Washington

THOSE to whom goose growing should appeal most at present are the many who might grow a few geese every year, either for home use or market, almost without expense. Under favorable conditions geese are the easiest of all domestic fowls to handle. They thrive most readily and are grown at least cost when given good pasture and provided plentifully with fresh water. Pools or running water for bathing are not necessary and if pasture fails, it can be supplemented by grain, preferably oats.

Housing and Yarding

Geese require no housing except in extreme cold or wet weather, when a low, rough shed open to the south and large enough to give the flock standing room under it, will provide all the shelter needed. They must have shade in summer as they suffer intensely with heat. Any low, woven wire fencing, pig-tight, will retain tame geese. Wild geese must be pinioned or enclosed in covered runs.

Mating

Geese do not come to full maturity until three years of age. They rarely give satisfactory results if mated under two years of age. Females will prove profitable breeders until ten years old and males to half that age. Geese do not often breed well if moved just prior to the breeding season. New stock should therefore be purchased in fall or early winter and a flock of breeders once established may be maintained without change for several years. Young geese generally pair. As the ganders grow older they will mate with from one to four or even five females. When once mated geese are generally faithful to their mates and if separated often refuse to mate again for a long time. After the fowls have been mated a large flock can be run together in one pasture but an unmated gander or goose can make no end of trouble in the flock. While access to a large bathing pool or running stream is an aid to fertility, good results may be obtained without it.

Care of Breeders

Geese breed best on pasture with water accessible. They make valuable scavengers if turned into an orchard after the crop has been harvested. They not only destroy the insects and worms that would infest the next crop, but they turn to profit the leavings of fruit. They require little grain if the pasture is abundant. If the pasture is short they should be fed mostly on cut clover, alfalfa, cabbages, raw beets, turnips, or potatoes, with some oats or barley and bran added. Corn is generally considered too fattening for breeding stock. Those breeders who recommend a mash use equal parts, by weight, of shorts and corn meal, wtih ten per cent of beef scrap added and mixed with cold water to the consistency of a stiff dough. Grit should be freely provided as well as fresh drinking water.

Hatching

Geese usually begin to lay in March and if not allowed to sit will lay from 20 to 30 eggs each. The first goslings should not be hatched until the grass begins to come in green. A hen will cover not more than five goose eggs, while the mother goose may hatch from 12 to 15. The period of incubation varies from 28 to 33 days, but averages 30 days.

In hatching under hens three points should be noted:

1. Since the time for hatching is once and a half as long as for hen's eggs, only hens that are in good condition and kept free from lice and properly fed will stay on the nest long enough to bring off a good hatch.

2. Since the first goslings may appear as early as the 28th day and the last one not until the 33rd or even the 35th day, it is a good plan to remove the goslings from the nest to a warm, flannel-lined basket as fast as they hatch or else the hen will become restless before the hatch is finished and leave the nest.

3. It is not wise to assist goslings from the shell. Let nature take her own time but see that the eggs are kept moist.

In hatching in an incubator these points should be noted:

1. All non-fertile eggs should be tested out on the sixth day.

2. Goose eggs need more cooling than hens' eggs.

3. After the 10th day the eggs should be sprinkled daily with lukewarm water, and from the 15th to the 20th day they should be dipped in lukewarm water for 30 seconds every other day and every day for the last ten days of the hatch.

4. Bring off the hatch at a temperature of from 105 to 106 degrees.

5. When cooling after the 15th day reduce the temperature to from 80 to 85 degrees.

Food and Care of Goslings

Do not feed the goslings until 48 hours old, but give them tender, finely-cut grass and water. If with a hen, give her a box large enough so that the goslings can get out from under her and move about, and yet not large enough for them to wander off and get chilled. Their first feed should be rolled oats or stale bread slightly moistened with water. Some breeders recommend bran, corn bread, or chick

Tells why chicks die

E. J. Reefer, the poultry expert of 905 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

food. In any case, tender grass or green shoots from oats or rye or barley cut very fine should form at least three-fourths of their ration. Overfeeding or lack of grass will cause leg-weakness and probably death. After goslings are a week or ten days old they may be safely turned out to live on good pasture, while fresh drinking water should be supplied at all times. Under no circumstances should goslings be allowed in the water before their breasts are fully feathered. When quite young, they should be kept under cover on wet mornings and in case of rain, and green food should be liberally supplied. If rapid growth is desired for quick marketing, grain may be added to their ration. Goslings reach marketable age when 12 weeks old and if well-grown should average 11 pounds.

Plucking Geese

Goose feathers are an item worth considering. Pluck only once a year, after the breeding season is over and warm weather has come. Wait until the old feathers are thoroughly ripe and dry at the root so that they are just ready to fall. The new pin feathers should have appeared and there should be no bleeding when the old feathers are removed. Remove only the soft feathers on breast, back, and abdomen, leaving enough on the sides of the body to lend support to the wings, which should be carried well up after the plucking. Young geese under 18 months of age should never be live-plucked. Geese should not be live-plucked after the middle of August. In New England the practice of plucking of live geese is generally regarded as barbarous and is condemned. It certainly should only be done when the feathers are ripe and then with care and in moderation. In plucking dead geese reject all quill feathers. After plucking, place the feathers loosely in cheap muslin sacks and hang in a light, airy place. Sunlight and an occasional shaking up are helpful. Keep the feathers in such sacks from three to six months, when they will be thoroughly cured and free from animal odor. They bring about 60 cents a pound in market.

FATHER GOOSE SAYS:

Higglepy, Piggleby,
My black hen.
She lays an egg
Every now and then,
At nine cents a dozen
And sometimes ten
The profits all go
To the middlemen.

If you can manage charcoal in no other way for the hens, then let them have all the ashes from the stoves. They will soon show you how they relish the bits of charcoal in the ashes. They work over and over the clinkers you take from the coal stove and find health in them.

The country is strewn with the wrecks of cooperative organizations that were born prematurely and which died by the wayside because the farmer himself deserted in the first real conflict with the established agencies that have handled his business.

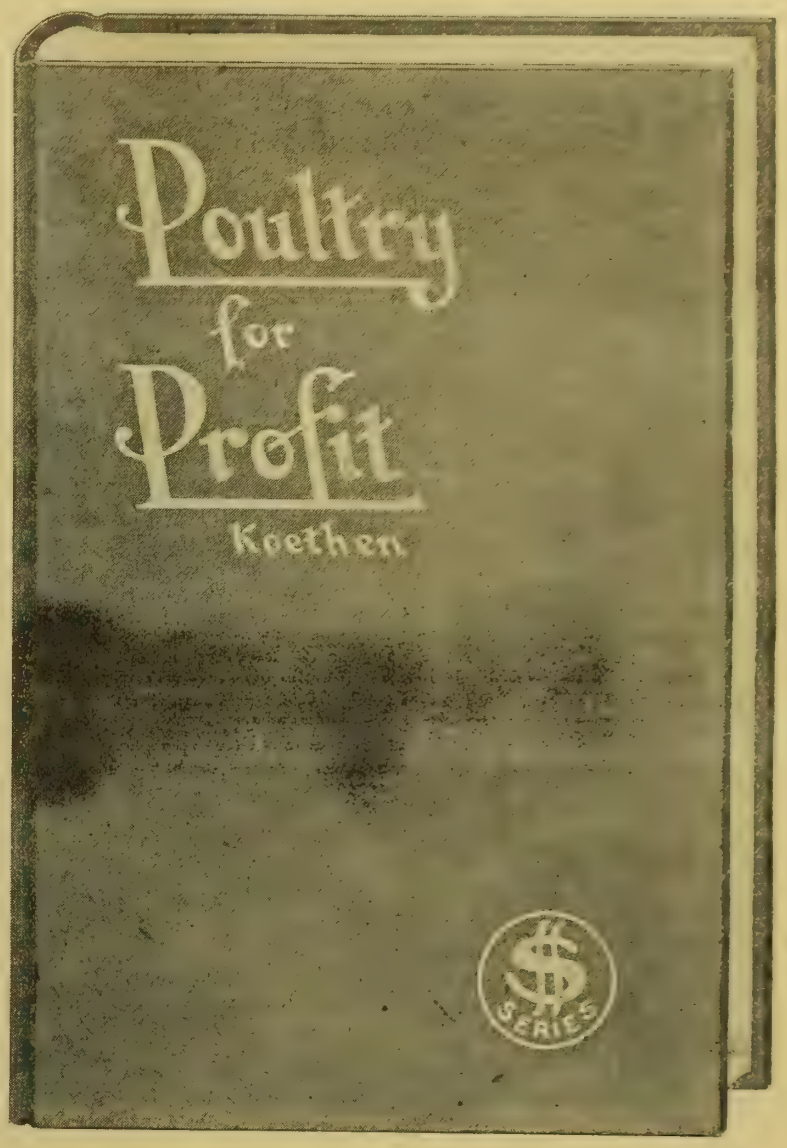
The Arizona State Poultry Association is now mailing to its members copies of the 1915 year book. It gives names of all officers and members of committees, together with name and address of each member, and constitution and by-laws. The secretary of the association is H. G. Powers, Phoenix.

Take better care of the home garden and orchard.

to make the

Poultry Business a Profitable Business

requires a thorough knowledge and practice of the many details connected with Poultry Raising.



the Cultivator Poultry Book

Poultry for Profit

by

Jean A. Koethen, Graduate of University of California

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information——

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

Los Angeles & Market Sts. Los Angeles

Gas Engines, centrifugal and deep well pumps, motors, and everything pertaining to irrigation, for sale and exchange. If you want a complete plant or any part write us; we are experts in irrigation; advice and estimates cheerfully given. Will buy, sell or exchange. Reliable and responsible, everything guaranteed as represented. Machinery & Motor Exchange, Inc., 733-735 San Fernando St., Los Angeles. Main 6382, F-3433.

RUMLEY CREAM SEPARATORS
at reduced prices.
More Cream. Better Cream.
Less Work.
Examine the Rumley, note especially the high grade of material that is used and the careful workmanship. Send for circular.
GERMAIN SEED & PLANT CO.,
326-330 S. Main St., Los Angeles.

We Carry—A complete line of irrigation machinery; consisting of engines, motors, pumps, clutch pullies, belting, well casing, etc. These goods are first class and guaranteed to be satisfactory. Our prices will interest you. Let us know your requirements. New or second-hand plants furnished. Commercial Iron Works, 497 Fifth street, San Francisco.

For Sale—Used and new gas engines, 2 H.P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild gas engines correctly. Get our prices. Lloyd, 806 N. Main, Los Angeles.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

Free Illustrated Book tells of about 300,000 protected positions in U. S. service. Thousands of vacancies every year. There is a big chance here for you, sure and generous pay, lifetime employment. Just ask for booklet S-85. No obligation. Earl Hopkins, Washington, D. C.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

For Sale—Ground Chile Pepper, the finest grade, $5.00 per hundred. Any quantity. J. E. Hathaway, Norwalk, Cal.

DUCKS

Raise Ducks for Eggs. Large, white, delicous flavor. Immune from vermin, diseases. Hatching eggs from pen. 29 Fawn Indian Runners producing 27 eggs daily, 60c doz. R. E. Wheeler, 1546 Patterson Ave., Glendale, Cal. Correspondence invited.

LIVE STOCK

Ohio Improved Chester White (O. I. C.)—Entire herd immunized against hog cholera. Nothing but immunized stock sent out. Extra fine lot of fall pigs, both sexes, ready for shipment during February and March. Three herd boars used. All stock crated and registered. Make reservations now. C. B. Cunningham, Mills, Sacramento Co., Cal.

Pure Bred Duroc Jersey Boars—Raised by Peters and Lamson of Imperial Valley are offered for sale by B. D. Forbes and can be seen at the V. D. Reductions Companies ranch, Durbin station near Covina, or enquire at the office of the company, 722 San Fernando Bldg., Los Angeles. Cholera Immune.

Hogs—Forty head of BIG TYPE POLAND CHINA boars of any age. Sired by IOWA WONDER, who is a son of A WONDER, the greatest hog living or dead. No females to sell at present. On account of large number on hand will make special prices. Geo. A. Smith, Corcoran, Cal.

For Sale—Registered Tamworth swine—boars, sows and gilts of this famous bacon hog. This breed commands a premium on the market. Our original sows from the University Farm at Davis. Sweetwater Fruit Company, Bonita, San Diego County, Cal.

Blue Ribbon Herd Duroc-Jersey Hogs—Bred Gilts a specialty, 15 bred now, 20 ready to breed. Sires and dams win all blue ribbons 1912, 1913, 1914 State fairs. 15 firsts, 13 seconds, 6 thirds, 7 fourths, 1 fifth. Will show 1915. For prices, write Jno. P. Daggs, Modesto, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

For Sale—One pure bred Guernsey bull. He is of the Langwater family. Four years old. For further information, inquire of Dr. D. J. Turner, of Gridley, Cal.

For Sale—Registered. Berkshires:. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy, Perkins, Sacramento Co., Cal.

Blatchford's Pig Meal weans pigs easily and safely; no trouble; no milk. Write for free folder. "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 1112 T Street, Sacramento.

Red Rock Ranch, Glen Ellen, Cal.—High-class Duroc Jersey hogs. Specialty registered pigs at weaning time. If interested write.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Novato, Cal.

Registered Berkshire Boars—Of all ages—one farrowed December 1, 1914—$15.00. Riccomi Bros., Mountain View, Cal.

Berkshires Registered—Young stock for sale at $10 each from fine blood. G. A. Casey, Box 7, King Road, San Jose.

Poland Chinas—Young stock; either sex. Write for pedigree. Reasonable prices. Edwd. A. Hall, Watsonville, Cal.

Glenview Poland China—Stock for sale. Chas R. Hanna, R. F. D. No. 3, Riverside, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

MOTORCYCLES

Order Your Motorcycle accessories and motorcycle parts direct by parcel post and save money, as we carry a complete stock, spring tandems, tires of all makes, lamps in all sizes, horns, and everything pertaining to motorcycle accessories, we have it. Also a fine selection of used motorcycles, consisting of the following makes: Excelsior, Indian, Thor, Harley and many other makes. We pay the freight on any motorcycle you buy from us. Write for a price list. Fred H. Bente, mgr. Excelsior Agency, 1550 Market St., San Francisco. Cal.

WANTED

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property free. American Investment Association, 12 Palace building, Minneapolis, Minn.

Wanted—To hear from owner of farm or fruit ranch for sale. O. O. Mattson, Minneapolis, Minn.

Wanted—To hear from owner of good farm or acreage for sale or exchange. C. C. Buckingham, Houston, Tex.

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

Richey's New Zealand Red Rabbits are the ribbon winners. Improve your stock with a fine buck. $5.00 each. R. D. 8, Box 557, Los Angeles.

Belgians—Heavyweights. With or without pedigree; express paid. Old Hickory Supply Co., Dept. 4, Capitola.

If you are looking for Pure-Bred Flemish Giants, any size, cheap, write Herbert Habecker, Hughson, Cal.

TURKEYS

Stearns' Turkeys—Won 19 first prizes at Los Angeles in January—more than all other turkey entries put together. Bronze, Black and White Holland eggs, $3 to $5 a dozen; Buff and Narragansett, $4; Blue and Bourbon Red, $5. M. M. Stearns, Claremont, Cal.

Mammoth White Holland Turkeys—A few fine toms for sale. Also eggs in season from two very select pens. Orders given prompt attention. Prices on application. Address H. McKusick, Box 733, Calexico, Imperial County, Cal.

Turkey Eggs—From the largest and best flock of MAMMOTH BRONZE TURKEYS in the world. Can fill orders from ten to one thousand eggs. Write for special prices. Geo. A. Smith, Corcoran, Cal.

THE SCHMEISER PORTABLE AUTOMATIC DERRICK

Saves Money in Handling Hay

The problem of quickly and economically handling loose or baled hay is easily solved by using this derrick. No modern farm should be without it. It can be moved from place to place as easily as a farm wagon. Can also be used for hoisting dirt, raising building materials or heavy loads of any description.

If You Write Us

we will explain in detail just how this derrick can save you time, labor and money.

FARM LANDS FOR SALE

For Sale—One of the choicest 20-acre walnut groves in the San Gabriel Valley, on Los Angeles-Covina electric line; 15 miles from the city, in the heart of the finest walnut growing district; 12-year-old trees in fine condition; half the place interset with fruit trees of all kinds in full bearing; good 6-room house and outbuildings; fine pumping plant, 125 inches water, supply water for 150 acres outside at good profit; place must be seen to be appreciated. Price, $20,000; terms. Address Box 144, El Monte, Cal.

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways, free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa, corn, grains, fruit, etc.; climate like California; ample markets; reduced passages; special excursion being arranged. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

For Sale—16-acre apricot orchard, trees mostly two years old. Soil a fertile, sandy loam, not steep, no frosts or winds; small house; good spring. Situated one and one-half miles from town on County road. Price $3500.00. Terms $1500.00 cash, balance long time and easy payments. No exchange. Direct communications to J. J. B., Rural Route No. 2, Watsonville, Cal.

For Sale—20 acres, Yolo County. Near State Farm at Davis. I will furnish alfalfa, beans and corn seed, also necessary farm implements. Plant now for the season's crop. See alfalfa and berries growing on the land. Dudley Moulton, 12th Floor First Nat'l Bank Bldg., San Francisco, Cal.

County Sectional Maps—Showing vacant government land, $2.50 any county. VERY PLAIN. Easy to see and select your choice. Booklet and circulars FREE. Write Joseph Clark, Searcher of State and U. S. Records, Sacramento.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange—Ten acres planted to two year old Valencia orange trees, at North Whittier Heights. Will consider trade for vacant lots. Box 54, Glendora.

For Sale—Orange, olive, peach and rice land. Close in, on good terms. Fred Hart, Exeter.

BEES AND HONEY

Beekeeping—Instruction book free—explains honey productions, profits, prices, supplies, bees and management without stings. Spencer Apiaries, Iris Avenue, Nordoff, Cal.

Bees and Their Care

QUEEN-REARING POINTERS

By Frank F. France, in American Bee Journal

IS NOT the subject of beekeeping like a game of checkers? Are there not certain moves to make to get to the king row? I would say yes in both cases. The first and best move to make is to provide each colony with a good, young, laying queen. A queen that does good work is one that produces a hive of bees that work. I once had a queen, and of a high type of breeding, that produced a strong colony, but her bees did not secure more than enough honey—the whole summer long—to live on, while colonies all around her filled three and four supers. Such a queen should be killed at once even though she appeared good.

There is a great study before us when we work out and compare the lives of different queens. There is as much difference in the personality of bees as there is in people. It is wonderful to watch half a dozen colonies and observe their differences and likenesses.

One of the most important features is to have your queens as nearly alike as possible, both as to breed and age, by securing them from some reliable breeder. Breeding queens should be changed every year to secure the best results.

I have been asked by many beekeepers to explain some of the methods I use in queen-rearing, also to explain how I use a little device to do away with a large share of queen bookkeeping. This device is the invention of Mr. H. Perkins, or Artesia, California, and is the best device I have yet seen to do the work required.

To begin with I secured good breeding queens from excellent stock, and if they come up to my standards as good layers, with well-marked bees that work, such are used for breeders. By importing new stock and changing breeders every year, and also testing them for honey gathering, I have stock that is worth while.

As the temperature here in the North is generally cold, I do not begin my cell building until the latter part of May or the first of June, when drones are plenty and there is little dandelion honey coming in. From this time on until the middle of August I put out cells on the average every other day, but in the height of the flow I put out cells every day.

To produce the best, long-lived queens that bring results, larvae not more than 24 hours old must be used for starting cells. All cells are raised in full colonies under the swarming or supersedure impulse. These cell-builders are made extra strong with brood from other colonies, so that there is an over supply of nurse bees that will thus provide the proper amount of royal jelly for each cell. All colonies and nuclei are fed to imitate a good honey-flow (if there be none); about half a quart of feed in the evening of each day. The best results cannot be expected unless this is done.

The subject of the proper sized nucleus here in the North is of great importance. During the earliest and latest periods of the year I use a common 10-frame super with three tight division-boards and a super, thus making four (two-full-Langstroth) frame nuclei, each division having a separate entrance and cover. The entrances are so arranged as to have one on each side and end. Over all is placed a full cover.

As the season advances and the weather becomes warm and settled, I use a twin nucleus hive. This hive is made on the same principle as the Root twin hive, only the frames are made one-half a standard frame instead of one-third. I have a great many more bees to keep the brood warm, a larger space for the queen to lay in, and I have less swarming. The division-board is made of plate tin with an oilcloth fastened to the top to overlay each side. Over all is placed a telescope cover.

One of the most important features of queen-rearing is the bookkeeping, especially if a record is kept of each individual nucleus. A little device is used to do away with a part of this work. It is made of tin, with a small knob to turn each wing out as desired. Each wing of the signal is painted a different color, as red, white and blue. In connection with the signal I use a small piece of cardboard tacked on the side of the hive numbered in a half circle as this: 1, 3, 6, 9, 12, 15, 18, 21, 24, 27, 30 with a wire bent to point to any one figure or to any third day in the month. For instance, suppose the signal indicates that there is a virgin (the white wing) and the hand points to 15, it would mean look for a layer the 15th, when the signal can be turned to the red, meaning laying. The blue indicates a cell. After the queen has begun to lay the entrance queen-excluder is pushed down over the entrance, thus holding her in case of swarming.

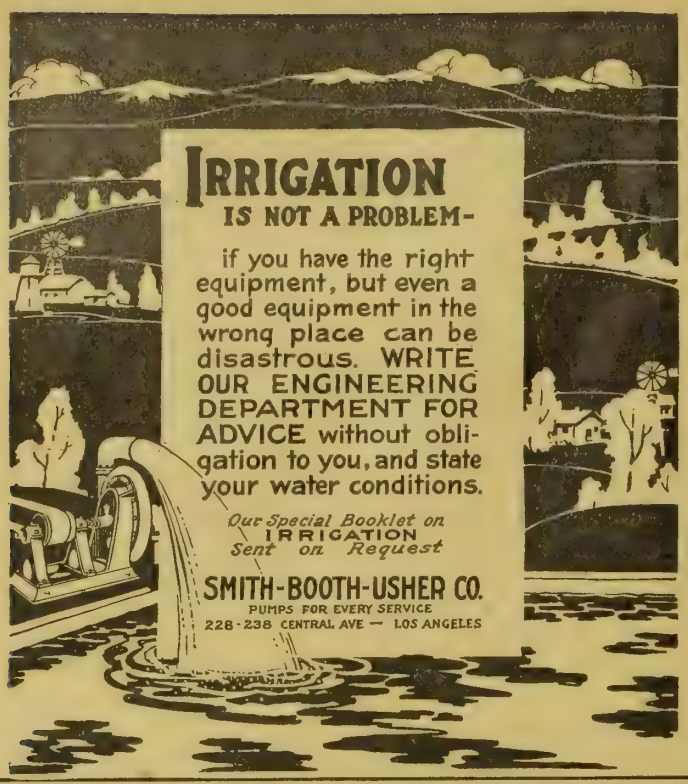
TESTING THE QUEEN

A poor queen can not always be judged by the amount of bees in her colony. I have known this rule to be used, but it is not infallible. Recently I had a very small colony whose queen to all appearances was first-class. To test her I exchanged stands with a very strong colony. In six days she had increased her brood space more than ten times the original amount. I was so pleased with the outcome of this trial that I have tried it on others, saving several fine layers that I might otherwise have destroyed. A weak colony at the end of a long honey dearth is not necessarily a sign of a poor queen.—Chadwick, in Gleanings.

FOUL BROOD AND DAMP CLIMATE

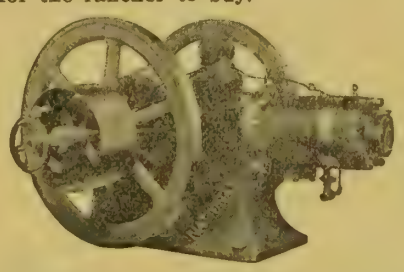
It is suggested, in the Irish Bee Journal, that Ireland suffers so severely from foul brood because of its damp climate, and reference is made to dry climates where foul brood is unknown. But Colorado is noted for its dry climate, and foul brood rages there. Much the same may be said of California. Foul brood may be unknown in South Africa, but not because of its dry climate.

Make farm life more sanitary.



National Oil Engine

An engine which will burn fuel costing three cents per gallon, and at the same time is an engine with 90 per cent less parts, is the engine for the rancher to buy.



A LETTER FROM A USER OF THE NATIONAL OIL ENGINE
Kingsburg, Cal., Dec. 19, 1913.
National Steam Pump Co.,
Los Angeles, Cal.
Gentlemen:
I bought the first NATIONAL Oil Engine sold in this State. Any one wanting an engine let them come and see my 15 H. P. pulling a 6-in. centrifugal pump lifting thirty feet throwing two cubic feet moving one foot per second, using low grade fuel. I will answer any letter.
Truly yours,
(Signed) L. E. HURLEY.

We guarantee the saving in fuel expense and purchaser's own judgment will tell him that in doing away with 90 per cent of the small, delicate and complicated parts, springs, gears, etc., that he is getting away from engine trouble when he invests in a National. 1915 catalog now ready.

Farm Bureaus

Ventura County, Wm. B. Parker, Adviser, Ventura

The "Farm Bureau Monthly" gives the following account of cover crop experiments:

A cover crop demonstration plot was seeded September 22, 1914, on the Hardison Ranch Company's place at Sespe. Black purple vetch, Black bitter vetch, common vetch, barley and rye were seeded.

When planted the ground was in good shape, and a good stand was obtained in all cases.

At a farm bureau field meeting held on the Hardison Ranch March 16, 1915, the following data was obtained: Comparing all plots with the best plot it was found that the black bitter vetch did not make a satisfactory growth, was smothered by the barley and was injured by aphids. The common vetch made a fair growth, but was badly injured by aphids, and partly smothered by the barley. The black vetch made an excellent growth, climbed well up on the barley, was only slightly injured by the aphids, and in all seemed the most satisfactory. The rye made only a slight growth, and did not compare with the barley as a crop to plant with the vetch.

It was decided that 40 pounds of barley was more than is desirable to plant with the vetch, and that 25 pounds would be better.

The black purple vetch did better at Nordhoff than the common vetch and from the demonstrations conducted so far this plan appears to be the superior vetch to use in the county.

The bureau has a squirrel control committee which has established seven stations in the county where squirrel poison will be sold.

The establishment of a county free library has been discussed in local meetings. Miss Eddy of the state library has been presenting the subject. As a result many petitions will be presented to the county supervisors asking for a county library.

Napa County, H. J. Baade, Adviser, Napa

The dairymen of Napa County organized a Cow Testing association at Napa, Saturday, April 3. The following directors were elected: Wiliam Mitchell, William Watt, Frank Peterson, Dr. Stetson, L. Crellin, R. Imrie and John Steward. President, William Mitchell; vice-president, William Watt; secretary-treasurer, Frank Peterson.

A tester was employed who will receive $80 per month, provide his own transportation and testing materials. Over 600 cows were entered and as many more are expected to enter within the next few weeks. We feel that the dairymen of this county have taken a very marked step in advance, by this movement. We are quite confident that results worthy of mention will be attained in a very short time.

San Diego County, H. A. Weinland, Adviser, San Diego

From the "Farm Bureau Monthly:"

The farm bureau is a place where the valuable knowledge of how to farm which has been gouged out by the taskmaster of experience can be spread about throughout the locality to the benefit of all parties interested. It brings together the best in each farming community and concentrates that effort upon such improvements or advanced methods as will bring greater returns to that section in general and the individuals in particular.

It is the medium through which the farm adviser can distribute valuable information gleaned from the best in other communities. It is the organization which takes up matters of local community improvement wherever no such organization exists and which in doing so concentrates local action on any progressive movement which will be for the general advancement.

One further phase of the subject must be mentioned, namely, the social side of the organization. No meeting of farmers discussing important and weighty problems connected with their business can be so good but what it can be made better by a little wholesome entertainment, whether it be musical, literary or otherwise. This factor cannot be disregarded and should be fostered.

The members of the San Luis Rey farm bureau are planning a picnic to be held sometime in May, at which time some University authority will be invited to speak. It is hoped that the Vista, Fallbrook and Bonsall locals will cooperate to make this meeting a large and important one.

Dr. Cady, of the veterinary science laboratory of the University of California, will be in the county during the last week in April. His trip will be an occasion for several meetings in sections interested in the raising of hogs, and his special topic will be "Hog Cholera, Its Detection, Prevention and Cure." Special meetings will be scheduled to take advantage of this opportunity in districts particularly interested in this question.

W. E. Ingelow, manager of the Bancroft Olive Ranch in Spring Valley, states that the orchard tractor has come to stay as far as they are concerned. When visited by the Farm Adviser on March 15, the machine was drawing 32 10-inch disks, double cutting a width of nine feet top-working their olive grove. He stated that they covered 15 acres in a day of eight hours at a cost of $1.25 for gas and oil.

At the annual meeting of the bureau on the exposition grounds at San Diego, March 20, 62 new members were added.

THE MAN WITH A PLAN

The passenger train makes best connections when it runs on a schedule time. If it fails to do so, there may be a collision. This is disastrous. The farm run by schedule will certainly make better connections than one run in a haphazard way. Instead of beginning a thing on a certain minute and second, as the railroad does, plan for that particular thing to be done on a certain day or week. True, new things are going to come up, but make allowances for the unforeseen. It may rain and keep you out of the field longer than you had expected; a team may run away necessitating repairing the harness and possibly making some new fence, all of which takes time, and if no allowance has been made for the unforeseen you get dreadfully behind your schedule.

Can you increase the value of your harness five dollars by oiling it? How much will it cost to do it? It is a waste of time to go to town three times a week when proper planning will make one trip answer the same purpose.

Certainly, things will come up unexpectedly, but just as certainly, a lot of definite things are going to happen. The farmer has to deal with the unknown as well as the known, and it is the fortunate farmer who knows enough about his business to plan, with a certain degree of accuracy, the work which is to come. He is the man with sufficient foresight to see and arrange to meet not only those things which are sure to come, but those which he may expect to come. —O. S. Rayner, Colorado Agricultural College.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Warts

Will you please give me through the Cultivator the cause and cure for warts on a young heifer. They are of the dry, scaly kind, from the size of a silver dime to a quarter.—Subscriber, San Diego.

If the warts are large and flat then it would not be advisable to cut them off. After each milking apply plenty of olive oil all over the teats.—W. J.

Shares

A owns 250 acres of land, tools and stock, but lacks money for help. A offers to put his labor against B's, each to share one-half of expenses (seed, feed, upkeep and sale of crops). Shares suggested are as follows: Land, stock and tools, one-third net profits; A, for his labor, one-third net profit; B, for his labor, one-third net profit. Is this a fair and just division? We raise barley, corn, potatoes, beans, some truck garden and a little fruit.—Subscriber, Ramona.

The arrangement seems to be very fair as we understand the agreement. The owner of the land, implements and animals needed for the cultivation values the use of these at one-third the net proceeds, and this is conceded by the others, one of whom in this case is the owner of the land. Then each partner agrees to furnish one-half the labor, or other expense, and receive one-half the net proceeds after paying for the use of land, teams, etc. The amount of rental received by the owner of the land will vary according to nearness to market, quality of soil and other advantages or disadvantages, together with other considerations such as teams, implements and seed.—J. B. N.

Peas in Milo Field

Am contemplating planting peas in my field of milo in the Imperial Valley. Which is the best variety?—Subscriber, Imperial.

We assume the subscriber wishes to know as to peas which will add to the pasturing value and in that case we doubt not the ordinary Canadian field pea will be the best.

Pruning Lemons

I have 242 acres two-year-old lemon trees. Some of the trees are growing long shoots. Would you advise me to prune them in order to shape up the trees or let them go as they are?—Subscriber, Alta Loma.

Prof. J. Eliot Coit answers:

"It is the best policy to prune back young lemon trees and force them to increase in size rather slowly, forming their main branches out of the somewhat slower-growing, fruiting type of growth rather than out of exuberant water sprouts or suckers. It is a good plan to have the main framework branches repeatedly cut back so as to make them many-angled."

Alfalfa Seed

The Cultivator has had several requests for information as to which cutting is the best for alfalfa seed production. The question was referred to Mr. Peterson of the V. A. Peterson Alfalfa Seed Company, at Arbuckle, and he writes: "This is a question that can be answered only by a knowledge of soil and weather conditions. Very little good seed is ever produced where irrigation is practiced. With the exception of two or three small districts the crop that is irrigated never seeds. Through the Sacramento Valley the third and fourth cuttings produce the bulk of the crops (about in equal proportions). A small per cent of the second crop is often left for seeding in the dryest areas. Usually this does not make good, as hot periods are more liable to occur at this time, causing seed to blast, or an over abundance of moisture makes too rank a foliage to make harvesting for seed profitable. The fifth crop in strong heavy soil will generally make good, but early rains and general weather conditions make it too risky for growers to take a chance. Throughout northern California the second and third crops make practically all the seed produced and in many events when the third crop is let go for seed much difficulty is experienced in harvesting owing to adverse weather conditions.

"In the vicinity of Modesto and south through the San Joaquin Valley, the custom prevails to leave the fourth and fifth crops. The land has of course been under intensive irrigation for the former crops, and there are varied results of success and failures. Even when an average yield has resulted the quality is hardly of a class to appeal to purchasers desiring reliable seed. Alfalfa seed is a crop which is somewhat uncertain. The farmer may have an immense crop of pods but when threshed find they contain practically nothing, and the field where he expected to get nothing brings home the bacon."

Late Blooming Pears

We recently had a request for information as to best pear to plant at a high altitude in the mountains where very late frosts are liable to occur. The question as to which is our latest blooming pear was submitted to Mr. Roeding and to Deputy State Horticultural Commissioner Weldon. Mr. Roeding writes: "The varieties I would recommend are Beurre Hardy and Doyenne du Comice." From Mr. Weldon's letter we quote: "About the only varieties of pear that bloom later than the Bartlett and Winter Nelis, according to records kept in Tulare County and published in Wickson's "Fruit Growing in California," are Beurre Hardy and Flemish Beauty. According to his table the latter variety is the latest blooming of all. The Bartlett showed the first bloom on March 14, Winter Nelis March 12, Beurre Hardy March 18 and Flemish Beauty March 20. The latter is a splendid variety and I see no reason why it should not do well at high altitudes. I have been trying to find out something in regard to the blooming habits of the Winter Bartlett, which is a seedling of the regular Bartlett but which ripens its fruit much later in the season. As the time of ripening does not indicate the time of blooming and as I have not been able to find anyone who could tell me just when it does bloom I do not know

Cut Rate Seed House

that it would be of any use for conditions such as those mentioned. I would say that either the Beurre Hardy or the Flemish Beauty would be more apt to escape the late spring frosts than the Bartlett or Winter Nelis."

Pound and Mission Pears

Answering an inquiry as to Pound and Mission pears, Mr. Geo. P. Weldon, chief deputy state horticultural commissioner. writes:

"Neither of these, as far as I know, are grown commercially in California at the present time. The Pound pear is not supposed to be of any great market value, but has been prized by some for cooking purposes. It is what we might term an overgrown variety and has not the quality of some of the smaller kinds. I have not come across any of the Mission pears in the state. Wickson mentions them in his chapter on Mission fruits in California and tells about 600 trees that were on the property of the San Jose mission in Alameda County. These pears were no doubt highly prized in an early day before we had better varieties. At the present time I do not think they are of any commercial importance and would come in about the same class as the Mission grapes. I find that Lelong mentions three varieties of Mission pears, one of them the Pera de San Juan, another the Pera de Coche, and the Bergamota. These are certainly not commonly found today, and I do not think they are of any commercial importance."

Brown Spots on Chrysanthemum Leaves

Will you kindly tell me what the brown spots on the within chrysanthemum leaves are, and what is the remedy? The leaves curl up and die. —Subscriber, Pasadena.

This question was referred to H. S. Fawcett of the Southern California pathological laboratory and he writes:

"These specimens appear to be affected with fungus rust. So far as I know there is no practical treatment for the affected plants this year, but for another year if the affected leaves and dead parts of the plants are destroyed at the end of the season and care is used in watering the plants, irrigating them so as to keep the water off the leaves rather than sprinkling, I think the rust will be prevented."

Bloody Milk

What is the reason for bloody milk? Cow is well, has been fresh since November. Feed green alfalfa and hay. Is there any danger in using the milk? When we feed her plenty she gives more milk and then it is we notice the blood. Does not put on flesh, puts it in the pail instead.—A. Kingsburg.

One of the causes of bloody milk is stated by the best veterinary authorities to be "when the circulation of blood through the udder has been suddenly increased by richer and more abundant food." This is probably the trouble with the Kingsburg subscriber's cow, in which case too much food must not be given.

Other possible causes of milk being bloody are: When the udder has been injured by blows, when congested or inflamed for any reason, when the cow is eating acrid or irritating plants, like the ranunculaceae (crowfoot family), when tubercles or tumors are present in the udder. When milk becomes red after it is drawn this may be due to the presence of a bacteria, bacillus prodigiosus, the socalled "bleeding bread" bacillus.

It would seem best not to use the bloody milk, at least not until a bacterial examination has been made. This will doubtless be made free of charge by the veterinary department of the University of California. Write to Dr. C. M. Haring, College of Agriculture, Berkeley, asking whether such examination would be made and for instructions as to method of taking and mailing the sample.—L. A.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Torrens Act

Please give me complete directions for placing the land now held by me under the Torrens act. Do I have to bring a lawyer into the matter or can I do it myself?—Subscriber.

The method for placing land under the Torrens act is really quite complicated.

The act was set forth in the pamphlet sent out to voters at the last general election, to which you may refer for particulars. In general, however, the first step is to file with the county clerk a verified petition to the superior court, which petition should state the full name of the applicant, his occupation, residence and postoffice address, whether married or not. If so, the full name of the husband and wife; if once married and the marriage terminated, when and how such termination was had.. Then the description of the land, the amount for which said land was last assessed by the county within which it is situated, whether or not the property is community property or is subject to homestead, any other liens or incumbrances which there may be upon said property, and the names and addresses of any holders of such liens as there may be upon said property. Also a statement as to whether or not the land is occupied and the name and title by which it is held by such occupant; also the names and addresses of all owners of adjoining lands. Where the land has been once platted, and a map thereof recorded, reference in the description may be made to such recorded map, or if not so recorded a survey must be made of said lands, a map of which survey must be filed with the petition.

If title has been brought down by any title insurance company, this title certificate may be made the base and start of a title search upon said property, otherwise there must be a full abstract of all transfers of said property from the original source of title, which must be verified by a competent title searcher or a certificate of an abstract company.

Upon presentation of the above to the court, if deemed sufficient by the court, an order is made directing notice of the filing of said petition to be addressed and served upon all persons appearing to have an interest in said land, which said notice should be personally served upon all parties if within the state of California and requiring them to appear and answer said petition within ten days after the service upon them in the county or 30 days elsewhere. The said notice must be published in a daily or weekly newspaper, published within said county, such publication to be for at least four successive weeks. Anyone claiming an interest in the land may within the time noticed appear and object in writing to the granting of the decree thereupon.

The case may be then tried either by court or jury. In case no answer is made to the petition by any of the parties upon whom it is ordered to be served, the case is then set down for hearing before the court, who shall then hear the evidence of the applicant, as well as of the surveyor and title searcher, and the court shall thereupon make a decree, which said decree becomes binding against the whole world and is an adjudication to the title of the property.

Appeals may be taken from this decree to the supreme court in the same way as in the case of any other civil case.

If at the time of the hearing or at any time prior thereto the court may deem it best to appoint its own examiner of the title it may so do and regulate the compensation to be paid to such searcher of titles.

After the decree is filed with the county clerk, the applicant shall procure a certified copy of said decree and file the same with the recorder of the county. The recorder for the purpose of this act is also made a register of titles. The fee for the filing of said decree with the recorder is $1.00, the recorder also receives a fee of one-tenth of one per cent of the assessed valuation of the said land. These fees go to the state to form what is known as an assurance fund for the purpose of insuring the titles made by this act. The register of title thereupon issues a certificate of title to the person or persons decreed to be the owner, which certificate describes the property, the character of the title and any liens or encumbrances which there may be. Thereafter transfers of the property may be made by the usual form of conveyance; provided that any conveyance of land, which has been brought under the effect of this title shall thereon bear a notation to the effect that the land has been registered under the act. It is also sufficient to convey the title to the land for the grantor to endorse upon the original certificate so issued by the register, that he has granted the within described land. Upon any lease for a period of more than one year, a mortgage or other incumbrance, the original certificate shall be brought to the register, who shall stamp thereon "leased" or "mortgaged" as the case may be, together with the date of such encumbrance.

The original certificate, so issued by the register, is conclusive evidence against the whole world of the title to the property. In case this original certificate is lost or in case the name of the party thereon is changed as by marriage or otherwise, it is necessary to file a petition in the superior court to have an order made upon the register for the issuance of a new certificate.

Land which has once been brought under this act is not subject to adverse possession even though it may be continued for any number of years. The state insurance fund is made to accumulate for the purpose of insuring parties obtaining title or bringing title down under this act against any error or mistake caused by fraud or negligence upon the part of the register.

From casually reading over the act itself, it would seem that it would be a rather difficult matter for an experienced attorney to properly take the steps necessary thereunder, and the main objection to the act is the high cost of originally bringing the property under the operation of such act. (It is impossible to state cost, but in an average case it is presumed the cost may reach $100.)

As before stated all further particulars may be found in that pamphlet issued to the voters of the state by the secretary of state at the last general election, a copy of which you can undoubtedly find somewhere in your locality.

The Household Department

GYPSIES

Oh, for the summer again and the bliss of it!
Back to the road, Love, and just you and me;
Night and its breath and the joy and the kiss of it—
Gypsies and lovers and dreamers are we!

All of the cares of the home and the fret of it
Left with the heat and the dust of the street;
Out on the road, and the joy that we get of it
Beckons and strengthens the wings of our feet!

Glow of the fire in the dusk and the gleam of it;
Scent of the pines and the runes of the night;
Musk of the bloom by the road and the dream of it
Tangles the sense with its witching delight.

Mansions are prisons! Oh, what do we care for them?
Night, with the whispering winds at our tent!
Never a day nor an hour can we spare for them
Under the stars and the broad firmament!

Chill of the autumn! Ah, then we'll return again—
Bees to the hive when the flowers are dead;
Bright in our home then the fires will burn again,
Watch fires of love till the winter be fled!
—Will Lisenbee in Ainslee's.

THE UNCHALLENGED LAW

Hannah Harding closed the door of the sod barn and braced it with a pole of scrub oak. The wind should not blow it open again and chill Old Jersey and her calf, she determined. Ugh! It was an ugly wind! It seemed as though it were always blowing in Roseau County. Hannah could not recollect a day that fall when it had no "blown pitchforks." Winter was "setting in" early too. She gathered her apron containing six eggs a little closer in one red, chapped hand, and taking the milk pail in the other, trudged wearily to the shack.

For a few minutes she worked hurriedly and put everything in order for the night. The milk was strained into two pans and put upon the shelf; the eggs were crated, and a half dozen chunks brought in for the heater. Then she put on the coffee pot, and while it boiled she laid aside her drabbled skirt and heavy shoes, and donned a neat gown and slippers.

"Now that the fall work is done I'm going to enjoy my evenings. I'll finish reading that story that I began last Sunday if it takes till midnight," and she settled herself beside the table and turned the lamp wick a little higher. She opened the magazine to the unfinished story, but instead of reading sat gazing at the pictures. She liked to look at the advertisements too, and turned to the cover pages.

"Oh, dear! how this lamp smokes! 'Pears like John D. takes special delight in pestering me with this sort of oil. Now if I were John D."—

What Hannah would have done had she been an oil magnate must be left for the imaginative to conjecture. Her hands folded tightly upon the magazine and her face seemed to harden. It was generally a severe face. Hanna thought life had dealt severely with her, and perhaps it had. It seemed that every year her eyes became a colder gray; that her lips set more firmly, and her hair was drawn back a little tighter (if that were possible), and that her whole form and nature became more firm and unyielding.

Suddenly she laid aside her book and gazed straight and hard into the open stove door. Hannah knew she was hard of heart. She ought to know—she had been told often enough, she thought. But what was the use of trying to be anything else? It was a hard world. Everything in it had been made hard for her. Even her name was Harding with but few softening vowels. To be sure John Knut Moe had once told her that he thought Hannah a pretty name. But what did that signify? Simply that John Knut Moe had poor taste in his choice of names. He had hard taste, she decided.

"Well, I filed on this quarter and I've stuck to it and proved up. I've seen hard times all along too; but I don't know as I'm sorry I did it. I've got my home and I'll keep it if I can pay taxes. But there's the ditch tax coming this year! Oh, what's the use! What am I doing it all for? Who'll have it when I'm dead? I have not a chick nor a child to leave it to, and I don't know as I want any. I say—life is hard—especially in Roseau County where one can't raise anything but milk thistles. Still, we did take the premium at the state fair. But what good would ten thousand premiums do me? I guess I lack what an author talked about in this magazine. He called it 'heart interest.'"

Again she picked up the magazine and turning to the unfinished story gazed at the illustration. It was the picture of a mother bidding her son goodby as he started for college. The lines in Hannah's face softened ever so little, and she turned the leaves till she came to a whole page of Mellin's Food babies. But soon the pictures were forgotten for listening to a

Are You Troubled With Ants?

Their Extermination Now a Simple Matter

One of the most exasperating afflictions the housewife has to contend with nowadays is a house overrun with ants. Many remedies have been devised, but none of them produced the desired results until a baker in Los Angeles, whose place was overrun with this pest, prepared a paste which seemed to have almost supernatural powers, as far as ants were concerned, ridding his entire place of them in one day.

So great a demand was immediately made upon him by his neighbors and friends that it was decided to put up the remedy for general use, under the name of Kellogg's Ant Paste. It can be obtained at all druggists, and thousands of testimonials from all over the country testify beyond question that a real exterminator of ants is now available.

Get a package from your druggist today and your ant troubles will be ended forever. But be sure it's Kellogg's.

Mayer HONORBILT SCHOOL SHOES

WEAR like iron, give twice the service of other school shoes and cost no more. Made with double leather toes, strong pliable uppers and toughest sole leather obtainable. Seams sewed with extra rows of stitching. Perfect in fit and style.

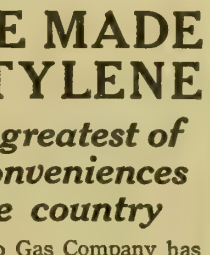
HOME MADE ACETYLENE

brings greatest of city conveniences to the country

The Chicago Gas Company has over 500,000 customers. Other big city gas companies have proportionately as many. These millions of city people wouldn't know how to get along without gas. They long ago found it so superior to oil and coal that they hardly know what these things look like.



GAS SUPPLY FOR THE BIG CITY

City folks used to have this great convenience to themselves. But today *Home-Made Acetylene* is even a greater boon to country homes than city gas is to city homes.

Acetylene is ten times richer than city gas—the light is white, more brilliant, and far more beautiful. Acetylene is also like city gas, a perfect cooking fuel. With an acetylene range in her kitchen the country housewife can enjoy cooking in cool comfort without any of the drudgery of handling kindling, coal or ashes.

The light fixtures are, too, handsome brass or bronze—selected from a catalog of many styles.

GAS SUPPLY FOR THE COUNTRY HOME

The men folks on the place can have big white lights of their own in barns and outbuildings — and have all fixed to light with the pull of a chain—without matches.

A quarter of a million farmers now make this light and fuel right at home. Each one fills his acetylene generator once a month with the acetylene producing stone, *Union Carbide*. The generator does the rest.

The new models are inexpensive and are wonderful improvements over the early types.

The Phone for My Home

WITH a Kellogg Telephone in your home, you are ahead of trouble and losses that come when sudden illnesses develop or long trips are taken to town only to find the markets gone to pieces.

The man with the good telephone in the house is in quick touch with the voice of the entire world. In a minute he knows the markets. In case of fire, tramps or illness, he can call the whole community. If he has an orchard and the fruit ripens quickly, he can scour the country for help in harvesting. The whole community becomes a living thing to him and that old dread of country life—isolation—is gone forever.

Kellogg Telephones
End Telephone Troubles

They are made in the largest independent telephone factory in the world, and have to undergo the most rigid inspection for quality ever devised. 37 distinct tests given every instrument before it is O. K.'d for shipment.

You may find that Kellogg instruments cost slightly more than ordinary ones. But a huge trade has been built on them all over the world because they do away with repair bills and because after years of service the voice is transmitted as clearly and plainly as when they are new. Just the other day a customer wrote us that he had a Kellogg phone in service fifteen years.

The instrument shown here is Kellogg Favorite. Less wall space, strong ring, reliable lightning standard, unbreakable receiver and mouthpiece, secret-service push button to ring "Central" without calling neighbors.

Send in your name and address and we will put you on our telephone bulletin list. Let our expert department help you in your telephone troubles. Get free the kind of information that will save you money. Write for Bulletin 24 a

peculiar sound upon the doorstep. Then a voice—"Hannah! Hannah! Open the door!"

She obeyed instantly.

"Why John Knut Moe! What on earth have you got in your arms so big and heavy that you can't open the door yourself? Come in." And in walked the big Scandinavian and deposited his bundle upon Hannah's bed.

"I brought you a present, Hannah, but I don't know what you'll be a thinkin' of it," and he slowly unfastened and unrolled a quilt in which lay a child—a boy of perhaps five years.

"Why have you brought him, John, and who is he?" questioned the astonished woman.

"I brought him 'cause I knew you'd be much more handy with him than I could be. Who he is I don't know. When I was comin' from town today I overtook him. He was cryin' by the edge of the swamp this side of Skunk Creek. He couldn't talk—he was so cold, and had next to nothin' on. So I figured that the only humane thing fer me to do was to fetch him along. I rolled him up and hurried the team all I could. But you know an ox team's slow, an' 'fore I got home I thought we'd better do something for him."

"We!" exclaimed Hannah, and John Knut Moe reddened to the roots of his hair.

"W'y, er—yes," he stammered, "I counted on your help or I wouldn't ha' brought him over. He's a pretty sick child, I think."

"Yes, he has fever," she returned. "He'll have pneumonia most likely." And she took one little hot wrist and counted the pulse. A tear trembled upon the child's cheek and she wiped it way. "Poor little man! I'll do what I can for him."

"I knew you would, Hannah. Somehow a child gets hold of a fellow's heart if he is old and—grizzled like me."

"Camphor and lard would be good to put on his chest, wouldn't it, John Knut?"

"I reckon so, Hannah. You know best," he returned.

And so the story remained unread for that night and for many nights following, for the little patient was ill many days. And what with this unexpected charge and the care of the home Hannah Harding found no time for the magazine. But John Knut Moe did all that he could to lighten her burdens. Regularly he came and cared for Old Jersey and her calf. fed the speckled hens, brought in the popple chunks and filled the water pail.

Gradually the little stranger returned to life and began to take a child's interest in the affairs around him. One day he raised his emaciated arms and clasped them tightly around Hannah's neck, exclaiming, "I feels this a-way!" And then it was that the almost middle-aged woman discovered, with a pang of fear, that she had developed "heart interest." The fear came with it because of the possibility of its being taken away.

The winter days wore away, and spring had melted the last drift of snow. They sat in the doorway of the homestead shack—Hannah Harding and John Knut Moe—and little Roseau played with Old Jersey and her calf very near.

"I thought some one would be calling for the lad sure, long 'fore this. We've advertised him 'bout long enough. But now I'm not particular whether he's called for or not," the man remarked guardedly.

Hannah was silent. The hard lines had disappeared from her fact, bright spots burned in her cheeks, and her eyes were shining.

"I couldn't let him go if anybody did call," she cried. "He's mine! I saved him!"

"No, he's minue, Hannah. It was me who saved him. I brought him to you."

"Then he very properly belongs to both of us," she laughed. How good it sounded to hear Hannah laugh.

"Very properly," he returned.

"Suppose we adopt him, John Knut." The suggestion came almost shyly and she glanced cautiously in his direction.

"I suppose there would be no law against it," he admitted quickly. "But seeing as our farms join, Hannah, let's adopt each other first. Couldn't we join hands over the quarter line with the child for a link? Eh, Hannah?"

Then the last vestige of hardness went out of Hannah's heart as she answered, "I suppose, John Knut, there would be no law against that arrangement either."—Farm, Stock and Home.

BELGIAN HARE RECIPES

The following excellent recipes have been received from readers in response to request in these columns:

How to Cook Belgian Hare

Rabbits are very fine fried or stewed with dumpling like chicken, or stewed, picked from the bones, the broth thickened and made into a pie with thin top and bottom crust.—Mrs. R. V. Kerfoot, Lemon Grove.

Hasenpfeffer

This is a tasty dish made of rabbit, although beef may be used. Put the meat in a stone jar and cover with equal parts of vinegar and water, to which one small sliced onion, salt and cloves have been added. Let the meat remain in this for two days, then remove and brown in a frying pan in butter or lard, turning it often, and add gradually some of the liquid in which it was pickled and cook until the meat is brown. When done add a cup of rich sour cream to the gravy.—M. C., Orange.

Baked Belgian Hare

Salt, pepper and flour as for frying, then put in dripping pan containing enough boiling water, slightly salted, to nearly cover. Add one cup cream

Improve Your Cooking

By a Knowledge of the Many Uses of Cornstarch

Most housewives could improve their cooking immensely, and provide a much wider range of delectable dishes for their families, by a little study of the possibilities contained in that delicious food product—Cornstarch.

Not only should cornstarch be used for thickening gravies and sauces, in place of flour; but it should be added to bread flour when making pastry, in order to secure the soft, fine texture so much desired. Care should always be taken, however, to see that the cornstarch is well cooked, when used for gravies and sauces.

The tasty desserts that can be prepared through the use of cornstarch are almost numberless. It is unnecessary to state, of course, that in order to assure the best results, the cornstarch must be right. Housekeepers all over the country recommend Kingsford's Cornstarch as thoroughly dependable and of superior quality. The manufacturers of this famous brand have issued a little book of recipes, explaining the many uses of cornstarch, which will prove invaluable to every woman.

These booklets can be obtained free upon request at all modern grocers. Try a package of Kingsford's the next time you are ordering, and ask for one of the little booklets.

or rich milk and bake until tender, then thicken gravy. Chicken is nice cooked this way.

We speak of farmers' wives having to cook without much meat, but do we always use what we have? I know I did not think of "fixing up" rabbits until the meat wagon stopped.—Subscriber, Bowles.

Rabbit Loaf

For this I use large wild rabbits which on account of the long fibre of meat are unpalatable. I use meal fires of one day to cook them tender, in very little water. I then grind meat in food chopper, add same quantity of toasted bread crumbs, and cold chopped potatoes. Add salt, pepper and sage and a little fat of some kind. Put in baking dish and pour over enough milk to dampen well. Top with greased bread crumbs and bake until brown. Rabbits make good hash.—Subscriber, Bowles.

Rabbit Stew (German Style)

Clean and joint a young rabbit. Place in deep dish and cover with vinegar. Let stand 36 hours; drain off vinegar, dip pieces in flour and brown in butter; place in saucepan. Cover well with boiling water and cook until tender; add one large onion minced, four slices of fried bacon cut in small strips; salt to taste. Season with two bay leaves, six cloves, six pepper-corns, two tablespoons sugar; add one-half glass vinegar, thicken gravy with browned flour, diluted with water. Serve on a large platter surrounded with potato dumplings.—Mrs. H. R. Franck.

Belgian Hare a la Maryland

Cut the hare in pieces for serving, after wiping with clean, damp cloth. Dip each piece in flour, then in beaten egg, seasoned with salt and pepper, then dip in sifted bread crumbs. Butter a roasting pan and bake the hare 45 minutes in good oven. After first 15 minutes baste very often with one-half cup butter melted in one-half cup hot water. Serve with cream sauce and toasted bread.—Mrs. H. R. Franck.

Rabbit Roasted

Clean, lay in salt water while preparing the following dressing: Mince a slice of salt pork and mix with sufficient moistened bread-crumbs to fill the cavity, seasoning it with pepper, salt, thyme, and onion. Stuff the rabbit and sew up closely. Cover with thin slices of salt pork, bound on with cord. Pour a cup of water in the pan and bake until done, basting often. Add a little lemon juice to the drippings. Dredge with flour, brown and remove from oven. Remove the slices of pork to garnish the platter. Thicken the strained gravy and season with butter and two tablespoons lemon juice, salt and pepper. Garnish platter with sliced lemons, greens and the salt port.—Mrs. H. R. Franck.

Rabbit Fricasseed (Brown)

Disjoint, roll in flour and fry brown in hot butter, then put rabbit in stewpan; pour boiling water in the frying pan, then pour it over the rabbit and cook until done. Season with salt, pepper, parsley and a little cayenne. The gravy seldom needs more thickening than the flour the rabbit has been rolled in. Chicken is also very nice fixed this way, omitting the parsley and cayenne.—Mrs. H. R. Franck.

DESTROYING INSECTS

Written for the California Cultivator
By A. M. H.

If you are troubled by moths in the house, try putting bits of soft cloth soaked in spirits of turpentine among the furs, woolens, blankets and carpets if they are to be rolled and stored away. Nothing is so effective in destroying these pests as turpentine. If any garment needs sponging before putting away, do so with water to which spirits of turpentine has been added.

With proper care the bed bug may be eliminated more easily than many insects by cleaning the beds thoroughly in the spring and then using a little care in inspecting them each day. Filling the cracks in wooden beds is a great help, and in the absence of a good paste, common laundry soap may be used, then varnished or painted over thickly. If any traces of bugs are found, mix well together one ounce of corrosive sublimate with one pint of wood alcohol, and apply to all cracks and crevices. This is a deadly poison and must be kept out of reach of children.

Roaches, water bugs and so on only stay where they are well fed. A pan of garbage is an invitation to the roach to make her home in your kitchen. To keep the room free from roaches, large black acts, etc., wash the shelves and any places where they are found with strong hot borax water and let it dry. Mix well together equal parts of ground red pepper and powdered borax and sprinkle in places where they run, then put some of the powder in an insect powder can and blow it into all cracks in the walls and behind shelves. It is well to put all small groceries into tin boxes or glass jars; this preserves their strength in addition to keeping out insects.

If a room is infested with fleas, the carpet, or floor covering of any kind, should be well beaten, and while the carpet is up the floor should be scalded with hot borax water. When it is put down again, go over it with a brush dipped in gasoline, but this must never be used in a room where there is a fire or artificial light. The gasoline will not only destroy the larvae of fleas, but it will brighten the colors in carpets and mattings.

Plenty of hot borax water used about the house will help to kill all kinds of small insects, then if you want to keep them out, keep the house and surroundings clean, dry, and fill cracks in floors that give shelter to small insects.

A Healthful Food for Little Tots

Something to Eat Between Meals

It seems to be the nature of all young children to crave an occasional "bite" between meals. This is generally satisfied by mothers with a piece of bread and butter, in preference to cakes and cookies. The child's natural craving for something sweet, however, causes it to tire in time of the bread and butter lunch. A most admirable substitute is to be found in spreading the bread with delicious Karo Syrup. This particular syrup is as clear and sweet as honey, and richer in consistency, while it is without the cloying quality that makes honey distasteful to some. Children can eat Karo freely, and will thrive on it. If you have not done so, order some Karo Syrup from your grocer today and give the little ones a treat.

Karo is good for many other things as well. As an accompaniment to waffles and griddle cakes it is unsurpassed, while it can be used in puddings and gingerbread with excellent results. All these things will be more palatable for both children and grown-ups if prepared with Karo.

From the Cocoa Bean to Chocolate

The entire process is shown in the Ghirardelli Building at the Exposition. The machinery used and the care necessary to produce the famous Ghirardelli Chocolate and Cocoa are fully explained.

Don't fail to drink a cup of Ghirardelli's Ground Chocolate—made as it should be made. This delightful food beverage is served day and evening.

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, April 14, 1915.

The prices given below, except where otherwise noted, are those made by wholesale or commission houses to retailers, and are intended to give producers the range of the market rather than an indication of prices which they will secure. Jobbers' quotations to producers are not given.

BUTTER

Prices to trade 3 to 4 cents above following quotations:

Creamery Extras ... .22
Firsts ... .20
Country ... .19
Ladle ... .18

CHEESE

Prices to trade, 1 and 2 cents higher:

California Fresh ... .13@13½
Cheddar ... .19@20
Domestic Swiss ... .20@21
Eastern Daisy ... .18½@19
Oregon Triplets ... .17@17½
Longhorn ... .18½@19
Imported Swiss ... .32-@34

EGGS AND POULTRY

Prices to trade, 3 cents higher than following quotations:

Fresh Ranch, case counts ... .23
Candled ... .25@27
Northern, case counts ... .22
Petaluma-Santa Rosa ... .23

Prices to producers:

Hens, lb. ... .16@18
Roosters, old 9
Broilers, lb. ... .28
Fryers ... .23
Roasters, lb. ... .20
Turkeys ... .17@20
Ducks ... .19
Geese ... .16
Squabs, doz. ... 3.00

LIVE STOCK

The following quotations are f. o. b. Los Angeles on all stock:

Hogs, 175 to 200 lbs., per cwt ... 8.00
Prime Steers ... 7¼@7½
Heifers ... 6¼@6½
Calves, lb. ... .8½@9
Sheep—
Ewes, head ... 4.50
Wethers ... 5.00
Lambs, head ... 4.50@4.75

POTATOES

HAY

Under date of April 10 Scott, Magner & Miller say:

Receipts of hay for the past week were 2606 tons, the preceding week 2150 tons. There is nothing of interest to be noted in the market other than the scarcity of fancy wheat or fancy red oat varieties.

Receipts of alfalfa have been heavier of late and according to reports from interior valleys they will soon be cutting their first crop. In Southern California the first cars of new alfalfa hay have already arrived in the market. There is no demand for straw.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (light bales) ... 11.50@12.50
No. 1 Wheat or Wheat and Oat ... 9.00@10.50
No. 2 Wheat or Wheat and Oat ... 6.00@8.50
Choice Tame Oat ... 11.00@12.00
Other Tame Oat ... 6.00@9.00
Barley ... 5.00@8.00
Wild Oat ... 6.00@8.00
Alfalfa ... 6.00@9.00
Stock Hay ... 4.50@5.00
Straw, per bale ... .30@45

Citrus Fruit Market

LOS ANGELES, April 14, 1915.

General conditions in the Eastern citrus markets are somewhat better. Decay is somewhat less and the outlook for the immediate future is better than for some weeks. Probably ten cents higher general average is being secured than one week ago.

There are probably 2,000 carloads of lemons in storage ready for shipment, but at the present moment prices are so low that there is but little encouragement to send forward. The principal stock now going forward is "tree ripes" and unfortunately these are not keeping well, which causes the trade to buy only from hand to mouth and pay only indifferent prices. Good stock shipped to Middle West points is selling so as to bring from $2.40 to $2.90 f. o. b. California. Eastern coast markets are shot to pieces by large receipts of foreigns. Some Mediterranean fruit has been selling in New York around $1.65.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 16,721 cars; lemons, 2,127; total, 18,848. To same date last season: Oranges, 18,493; lemons, 1,023; total, 19,516. From Tulare County this year, oranges, 5,199; lemons, 187; total, 5,376; to same date last season, oranges, 4,647; lemons, 30; total, 4,677. From Northern California, oranges, 627; lemons, 1. To same late last season, oranges, 398; lemons, 5.

NEW YORK, April 12.—Thirty-two cars navels, one car navelencias, two cars budded, one car navels and navelencias, five cars navels and bloods, one car navels, bloods and tangerines, four cars lemons sold. Navels about fifteen to twenty cents higher. Lemons unchanged. Weather fair.

RURAL CREDITS

(Continued from Page 461)

by the capital of the company. The debentures are issued in even amounts of $100 and upward and for varying periods, affording the investor some of the usual conveniences of bonds. However, inasmuch as the purchaser of a debenture does not know the particular mortgages used as security he must rely on the integrity and solvency of the company to protect his investment.

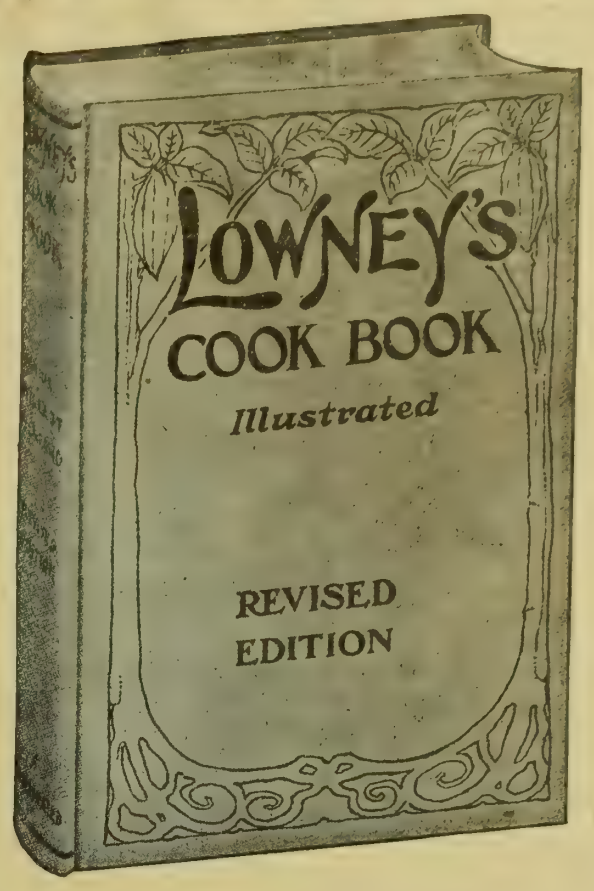
Rural Credit Cooperative Associations

The students of rural credit recognize the desirability of another piece of legislation which may probably be had at the hands of the several states or of the federal government, namely, legislation authorizing and encouraging local personal cooperative credit assocations. Some states have already taken steps in this direction and others are contemplating taking them. The department of agriculture has made earnest investigations in this field and is in position to offer suggestions as to legislation and as to the form and operations of rural credit cooperative associations. Such associations as these will perhaps render the country where there are many small farmers whose individual resources may not be sufficient to enable them to secure the requisite credit. Their largest field for operation would probably be the South. Characteristics of such associations of small farmers are: Unlimited liability of members, the pledging of the faith of each to the other and of the whole to the lender; the use of funds for clearly defined productive purposes; and the supervision by the association of the use made of the funds. It has been objected that the feature of unlimited liability will prevent the organization of such associations in this country, but in certain sections of the nation the liablity of small farmers is already unlimited, and this could not be said to be an insurmountable obstacle.

In reference to such proposed associations, as well as to land-mortgage banks, it is of the utmost importance that attention be centered on the use which may be made of borrowed money. It is of high importance that there should be guaranties of the use of funds secured for productive purposes on the farms covered by mortgages or other obligations; otherwise the field for speculation will be opened and more harm may result than good. The investigations of the department indicate that a relatively small number of the banks of the country pay any attention whatever to the purposes for which loans are made, and in replies to inquiries many of the banks reporting did not even attempt to give data bearing on this important point.

The office of markets and rural organization has continued its investigation into the field of personal credits. From data gathered it appears that the state, private, and savings banks and trust companies supply approximately $1,000,000,000 for short-time loans to farmers and that national banks furnish $750,000,000. As may be expected because of the differences in the relative importance of agriculture in various states, these short-time loans are very unevenly distributed. The funds are used chiefly in the financing of cattle raising, feeding, and marketing, of dairying, of hog and sheep raising, and of grain and cotton growing and marketing.

Lowney's Cook Book, The Housewife, and The Cultivator, One Year — **$1.65**



This Now Famous Cook Book

covers the bill-of-fare from relishes to after-dinner coffee. There are 65 different salads; 15 salad dressings; 73 soups; 50 recipes for vegetables; 91 entrees, from Aspic Jelly to Chicken Supreme; 51 sauces for meats and vegetables; 41 rules for the chafing dish. There are over 400 desserts; 84 cake recipes, not counting the fillings and frostings; over 60 recipes for invalid cookery, besides recipes for fish, meats, hot and cold desserts, bread, cake, beverages, etc.

The recipes are the latest word in scientific cooking, refined, wholesome and appetizing. There are chapters on the properties of foods; on how to market; on the theory of baking and boiling, etc., on the butler's duties and how dinners and lunches, formal and informal, should be arranged, set and served; and the woman who does her own cooking will find hundreds of simple, practical, economical dishes, which will be worth many times to her the cost of the book.

The Housewife

The Housewife is a fine, large monthly magazine edited for the woman whose first interest is the welfare of her home. Its short and serial stories are of superior merit, and are invariably cheerful and sunny. No morbid, melancholy or unwholesome stories are ever printed in The Housewife.

The Cooking Department and the Fashion Department combine luxury with economy, and are under the supervision of well-known experts. The Fancywork and Home Decoration Departments are of especially high standard, and the pages on Entertainment contain valuable and novel suggestions.

The corner devoted to "Mother's Realm" is of practical interest to those interested in the care of children and is composed of entirely common sense advice and suggestion with no untried theories.

The Housewife is finely illustrated and has excellent colored covers by well-known artists. The near-million women who read The Housewife during 1915 will find the stories of unusual interest—the kind which are sure to make a worried housekeeper forget her troubles, and to chase fatigue from the tired home manager. They will be exciting, uplifting, wholesome, and altogether human, and will be illustrated by men and women who know their business perfectly.

For a short time only

We will, on receipt of only $1.65, send the California Cultivator for one year (new or renewal), The Housewife for one year, and in a stout box, postpaid, this 421-page cook book, well printed on good paper, strongly bound in linen. Send orders with remittances to

LAMBERT STEEL HOOF TRACTOR in the Orchard

YOU CAN RANCH AT LESS COST

The Lambert Tractor will positively cut down your ranch expense. You can accomplish four times the work you are now doing, at a lower cost. The Lambert will do the work of 8 or 10 horses, only one man's services are required and it will run all day long on less than a dollar's worth of fuel. You can figure up for yourself the big saving you can make. And the beauty about the Lambert is that you can put it to all manner of uses—for plowing, harrowing, discing, cultivating, running power machinery, hauling crops, etc. Note the illustration—trees with low hanging branches are no hindrance. Only the highest grade material is used—it's built to last. Call and see demonstration, or write today for Catalog.

CALIFORNIA CULTIVATOR

Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES April 22, 1915 SAN FRANCISCO

Glen Alpine Falls, Lake Tahoe Region El Dorado County

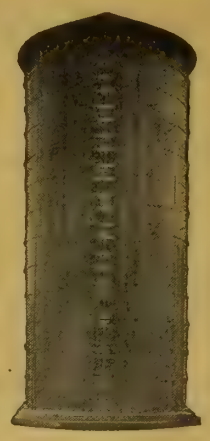
The Lincoln Highway in its entrance to California will traverse through El Dorado County many scenes like the one on this page. The state highway commission has built from Folsom through Placerville and to the Nevada state line the Lake Tahoe wagon road, one of the finest grades and most traveled highways in California. It follows the route of the original Emigrant Trail from Salt Lake by way of Carson Valley over the mountains to Sacramento.

This highway follows the canyon of the South Fork of the American river from a point about 15 miles east of Placerville to the western summit of the Sierra Nevada mountains, passing through the lowest gap in the range in this county at an elevation of 7300 feet above sea level, and thence descending precipitously into Lake Valley.

The ride from Placerville to Lake Tahoe points is one of the real pleasure trips of California, every one of its 60 miles affording a new and enjoyable experience. Along the entire route rugged mountain scenery appears at its best on every hand. The engraving on this page is used by courtesy the Mountain Democrat, Placerville.

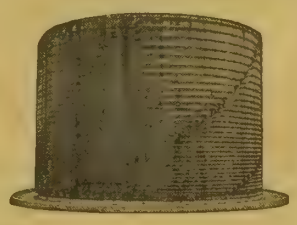
SILOS

BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS



16 x 36 Redwood Stave Silo manufactured by us for the Panama-Pacific International Exposition, San Francisco, 1915

TANKS

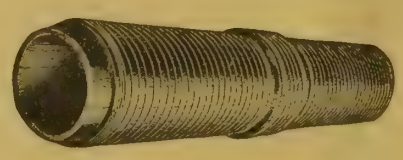


Built to order, to suit all uses and users. Cheaper than metal tanks, last longer. Won't rust. Can be taken down and re-erected without damage. Capacities, 500 to 500,000 Gallons. Towers included if you want them.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE

For water supply—irrigation or power. Cheaper than any other pipe of equal size or capacity. Longer lived than any metal pipe except cast iron.



All our silos, tanks and pipe are designed by engineers to meet every condition. Made in our big factory from CLEAR, AIR DRIED REDWOOD. Selected from a stock of 40 million feet which we carry at all times.

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIV No. 16 LOS ANGELES: THURSDAY, APRIL 22, 1915 One Dollar Yearly

Is "Plugging" Trees Injurious?

An Old Time Method Reviewed and Criticized. It Also Finds Some Who Commend It. Cultivator Advises Caution in Using This Process.

IN the Cultivator of October 29, 1914, we quoted from Science regarding an experiment by Fernando Sanford of Stanford University "on killing tree scale by poisoning the sap of the tree." This experiment consisted in the boring of a three-eighths inch hole in the trunk of the tree to a depth of about three inches and filling nearly full of crystals of potassic cyanide. This hole was then plugged and "in two days the scale began to fall from the tree and in a few days all appeared dead. Others hatched and attacked the tree, but lasted only a short time, and the tree has since been free from scale and vigorous."

"It would seem from this experiment that it is possible in some kinds of trees, at least, to poison scale and sap-eating insects without injury to the tree. The method would seem to be especially adapted to killing various kinds of borers and insects which, like the pine beetles, burrow beneath the bark."

This item called for some comment, and in connection with the article the editor of the Cultivator referred to the fact that some years ago the Los Angeles County horticultural commissioner investigated and cut down an apple tree which had been plugged and filled with a so-called insect killer and that the commissioner at Los Angeles declared the experiment a complete failure. Because of the comment which the former article caused we have looked up the report made by Frederick Maskew, at that time connected with the county horticultural commission, and given in full in the Cultivator of December 30, 1904. From that report we make quotations below.

First we refer to the engraving on this page, which is copied from one appearing in the issue of December 30, 1904. The plug of wood from which this engraving was made was on exhibition by County Horticultural Commissioner Jeffrey for some time and was considered at that time proof conclusive that that particular insecticide was not absorbed by the tissues and remained inert as placed in the tree some months before. From Mr. Maskew's report we quote:

"Owens Process a Failure

"At the regular meeting of the apple growers of Los Angeles County, held on January 16, 1904, appeared a Mr. Stewart, representing himself to be the authorized agent of the 'Owens Process' for the treatment and cure of all diseases and insect pests affecting fruit trees. Being given the privilege of addressing the meeting he set forth in no uncertain terms the claim that the remedy he was offering to the long-suffering fruit growers, at the low price of 25 cents per tree, was a well tried and proved panacea for all troubles of the orchard; acting with equal dispatch and efficiency upon the bacillus of the blight and the spores of the fungous diseases as upon the biting and sucking insects that infest the wood, fruit and foliage of the tree, including in this category even the larvae of the codling moth."

Mr. Maskew then called attention to arrangements made to test out the process, and "an orchard in Downey, one in Compton and one in Cerritos were selected for the experiments. Trees in these orchards were treated according to the formula during the month of January by Mr. Stewart in person. At the annual meeting held on December 17, 1904, the owners of these orchards reported that they had positively been unable to detect any benefit or improvement whatever in the trees treated by Mr. Stewart. The foregoing were free experiments voluntarily made by Mr. Stewart for the purpose of demonstration. To provide against any possible claim that the failure of the 'Process' to accomplish its wonderful results in these free trails was due to the omission of any details in the methods of application another test was made in an orchard at Florence. This was no experiment, on the contrary it was a strictly business transaction for which the sum of $25 was charged and paid for the treatment of 100 trees. The owner of these trees stated at the meeting on December 16, 1904, I cut down the Pearmain tree and sawed out a section containing the part that had been treated by Mr. Stewart. The cross section showed the tree to have been seriously affected by the act of boring into it. To the extent to which the hole had been bored the body of the tree was apparently dying, the line of demarcation between the healthy and affected tissue being very distinct. Immediately above and below the auger hole the wood was dead and dry. On December 17 at the meeting of the apple growers and in the presence of the members, this section was carefully split open and the dark-colored powder was found in the auger hole in apparently the same quantity and condition as when put there by Mr. Stewart in January, 1904." (See engraving on this page.)

"In so far as the apple trees of Los Angeles County are concerned the

Section from a Plugged Tree
Reprint from the California Cultivator of December 30, 1904, showing hole and material in apple tree. Material unabsorbed and tree injured.

17 that while he had watched these trees carefully all summer he had been unable to detect any change or benefit to any of them."

Mr. Maskew also calls attention to experiments on his own place in which "A White Winter Permain tree 12 years old was selected. This tree had borne many large crops of fine fruit in the past." Also "A Yellow Bellefleur tree eight years old was selected as a second test. This tree was normal in health so far as I could judge but was infested with a few San Jose scale. The test in this instance was to prove the effect of the 'Process' upon scale insects. The method of treatment was very simple. Mr. Stewart bored a one inch hole into the body of the tree about one foot above the surface of the ground. Taking a metal cylinder he partly filled it with a dark colored powder and inserted the cylinder into the hole, then with a wooden rammer he forced the powder into the hole as he withdrew the cylinder. A wooden plug was then produced neatly turned to fit the hole. This was driven in, and the end of the plug and the bark surrounding it painted."

"These trees were so situated that I passed them every day. In the case of the Bellefleur tree the San Jose scale developed and increased at such an alarming rate that I destroyed the tree the first of June. On December Owens Process has proven a failure. —Fred R. Maskew." * * *

* * *

The above is ancient history. However, now come new investigators and maintain that with cyanide of potassium there is possibility of reducing tree borers and perhaps some other pests. Regarding the success there is still diversity for we note in Science of December 11. 1914, the following which was, we assume, reference to the article we formerly quoted in the Cultivator. This article nearly entire is as follows:

"Cyanide of Potassium in Trees

I note an interesting contribution to Science in the issue of October 9, on the subject of cyanide of potassium taken up by trees when put into holes in the same. I wish to report that this chemical is the chief basis of treatment by a firm in Pennsylvania doing an extensive business in some of the eastern states, claiming to render trees immune from attacks by all insects and diseases and also to fertilize them. The process was originated by a man named Kleckner and is now continued by a company called the Fertilizing Scale Company. Their theory is that a tree can be given medicine as well as food by placing the same in capsules and fastening these in incisions under the bark. While the chief insect poison is cyanide of potassium, yet they use chlorate of potash and sulphate of iron 'to give the trees chlorine, sulphur, iron and potash.' They make wonderful claims for the destruction of the scale and invigoration of trees, and commenced by charging 50 cents per tree for the so-called 'vaccination.' The price is now reduced to 15 cents, but they are taking thousands of dollars from the confiding public.

"The important scientific point is that I have examined hundreds of trees treated by them and have in some instances found no evidence that scale insects were ever present, while in others I have found San Jose scale alive on the trees some time after treatment. What is much worse is that I have found it true that some one or more of these chemicals is evidently taken up in the sap of the tree, and that to a considerable extent. While the material was placed under the bark about 3 feet from the ground. it blackened the cambium layer as high as I could reach and remove the bark and started blight or death of tissue at the place where inserted. I have the names of scores of persons whose trees or orchards were finally killed by this treatment. One man, whose name and address I can give, thought that it benefited his trees and had it applied the second year, and the trees then died quickly. He is now disgusted with the treatment.

"In company with Professor I. C. Williams, Deputy Forestry Commissioner of Pennsylvania, I visited an orchard in Lebanon County that had been treated a few weeks previously. The San Jose scale was found alive on the trees, but blight or death of tissue had commenced at the place of treatment and had worked downward slightly and upward considerably, and in fact, as high as one could reach. During the present week I have learned of another orchard. in Cumberland County, Pennsylvania, that was blighted and destroyed by the cyanide treatment. Therefore, while it is evident that some chemicals may be taken up in the trees and may even destroy some insects, it is further evident that they may be injurious to the trees and should be applied with great care and only after considerable experimentation and should be recommended by scientists only after great deliberation. I shall send to interested persons printed articles on this subject from the office of the state zoologist, Harrisburg, giving names and addresses of persons whose trees have been killed by the cyanide 'vaccination,' as the fakirs call it. These may be published.—H. A. Surface, State Zoologist, Department of Agriculture, Harrisburg, Pennsylvania."

Commenting on the above another correspondent in Science of February 26, 1915, gives the following:

Effect of Cyanide of Potassium on Trees

"My attention has been attracted to an article in your columns by Professor H. A. Surface relative to the use of cyanide of potassium for elminating insect attacks on trees. While I have not investigated the claim of the firm referred to in his article, and know nothing about their process, however, from my own results with cyanide of

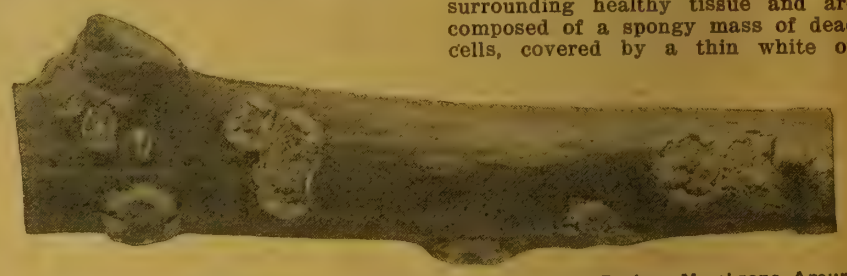
Citrus and Tropical Fruits

CITRUS CANKER

FLORIDA citrus growers, especially those with grapefruit orchards, are greatly concerned over the scourge of citrus canker which is visiting the state. To give California orchardists an idea of what citrus canker means we quote from Bulletin 124 of the University of Florida agricultural experiment station, and by their courtesy give illustrations showing some of the heroic methods of control which are being used. Sprays are shown to have some value in preventing infection of an orchard, but, once infected, sprays are of no value. The torch seems to be the only salvation for trees, totally destroying those which are affected.



Canker on Young Twig of Citrus Trifoliata, Showing the Broken Membrane Around the Spots. (Magnified about three times.)

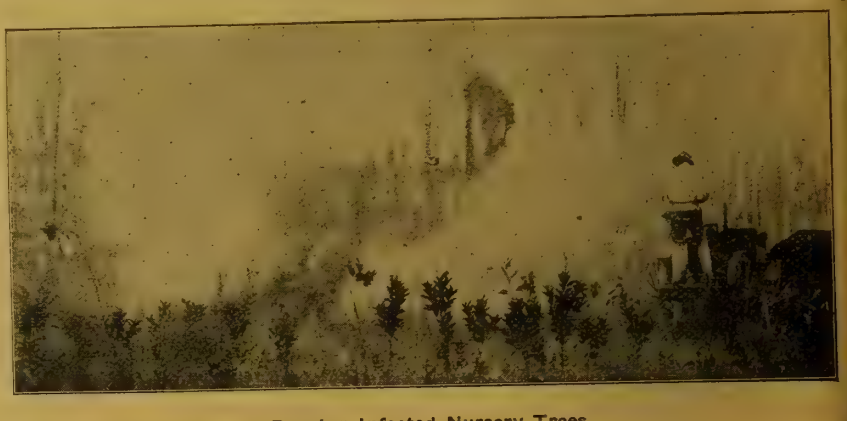
Appearance of Citrus Canker

"Citrus canker attacks the leaves, young shoots, branches and fruit, forming a characteristic spot which is similar in general appearance on whatever portion of the tree it occurs. The disease has been found on all varieties of citrus except the kumquat. Grapefruit is apparently most severely attacked, the infection occurring on leaves, twigs, branches and fruits. Citrus trifoliata is probably next in susceptibility, followed by some of the sweet orange varieties. Infections have been found on the stems, twigs and petioles of Citrus trifoliata, but not on the leaves. The disease has been observed on leaves, twigs and fruit of the navel and some other sweet orange varieties. Scattered infections have been found on the leaves and twigs of the Satsuma, Tangerine, lime and rough lemon.

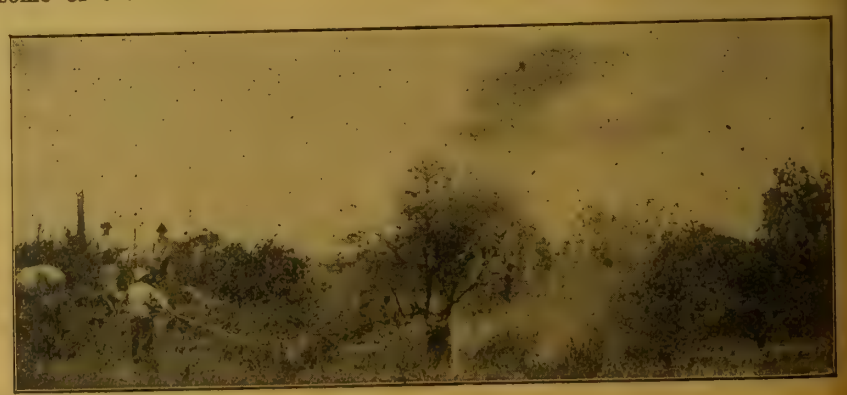
"The distinguishing feature of citrus canker as observed in the field is the characteristic spotting produced on the fruit and foliage. As usually seen, the infection appears as small light-brown spots, from less than one-sixteenth to one quarter of an inch in diameter. The spots are usually round and may occur singly or several may run together, forming an irregular area. This last usually occurs on fruits. The spots project above the surrounding healthy tissue and are composed of a spongy mass of dead cells, covered by a thin white or grayish membrane. The membrane finally ruptures and turns outward, forming a lacerated or ragged margin around the spot.

"On the leaves infections first appear as small, watery dots with raised convex surfaces. These dots are usually of a darker green than the surrounding tissue. Sometimes, however, the surface of the spots is broken as soon as they appear. Spots may appear on either surface of the leaf, but they do not at first penetrate through the leaf tissue. They gradually increase in size, change to a light brown and become visible on both sides of the leaf. In the older spots one or both surfaces may be bulged or raised, and such spots are commonly surrounded by a narrow yellowish band or zone. In the more advanced stages the surface of the spot becomes white or grayish and finally ruptures, exposing a light brown spongy central mass. Old spots soon become overgrown by saprophytic fungi, and may appear pink or black on account of these fungus growths.

"On the fruits the spots are very similar to those formed on the leaves. They project and retain a circular outline. They do not penetrate far into the rind. They may be scattered over the surface, or several may oc-



Burning Infected Nursery Trees



Burning an Infected Grapefruit Tree

cur together, forming an irregular mass.

Control

"The problem of controlling citrus canker is going to be a difficult one, and a greater undertaking than the average grower can attempt. What I mean by to control is to thoroughly eradicate the disease from infected trees and still be able to save the trees. With the present distribution of the disease, confined as it is to a comparatively small area in Florida, I would advise the complete destruction of all infected trees just as soon as the infection appears, whether such trees are in nurseries or groves.

"The next important step is to prevent the introduction of any more of the disease into the state. Citrus canker has been found in all of the states bordering Florida and has been found abundantly in parts of Texas; and while the disease may not prove so serious in those states, it is undoubtedly a menace to the citrus industry of Florida.

"I am not certain just how effective the use of fungicides will be in controlling this disease. So far I have carried on no spraying experiments in regard to this, but the results obtained by some who have used Bordeaux mixture are not encouraging. The disease may be kept from the foilage and fruit by keeping them thoroughly covered with some fungicide throughout the season, but this would require a number of sprayings at intervals of ten days or two weeks and a continual fight against scale-insects. Cankers formed on the twigs and larger branches would probably not be affected by the fungicide and would remain as centers from which the infection would spread again as soon as the spraying was discontinued.

"It would be almost impossible to eliminate all infections from a badly infected tree of any size by defoliating and pruning, for on the larger branches minute cankers, hardly distinguishable without the aid of a lens, would be almost certainly overlooked. I should say that only an expert would be capable of eradicating the disease from an infected tree, and then it would require continual vigilance on his part. Uninfected trees or groves in infected districts may be protected by spraying with some fungicide, but the sprayings must be thorough and often repeated. It would be better, however, to remove and destroy the infected trees."

CYANIDE OF SODIUM—POTASSIUM

In the article by Horticultural Commissioner Collins of Tulare County in the Cultivator of April 1 appeared the statement, "In all our work nothing but 96 to 98 per cent sodium cyanide has been used, which is equivalent to 128 to 130 per cent potassium cyanide."

A subscriber rang us calling attention to this statement as an error and as it may apear to others that it is the reverse of the ordinary way of referring to the strength of these compounds and in any case confusing, the matter was referred to Mr. F. W. Braun for fuller explanation, and he says that Mr. Collins' expression is correct. He writes as follows:

"Regarding Mr. Collins' statement I will say that he is right in stating 96 to 98 per cent sodium cyanide. That is correct in strict chemical nomenclature, as the sodium cyanide which is used for fumigation purposes is about 98+ per cent pure. The manufacturers, however, guarantee it as being 96-98 per cent pure. This material is commercially designated as cyanide 128-130 per cent, because of commercial practices which have followed the evolution of the manufacture of cyanide from first. rather impure, mixed cyanide salts to the pure potassium cyanide, and then to the mixed or double salts of cyanide of sodium and potassium, to at last the practically pure sodium cyanide. All along the cyanogen content, or chemical value of the cyanides, was designated by the percentage of cyanogen contained, based on pure potassium cyanide. It is perfectly proper, when speaking of sodium cyanide, to say 96-98 per cent pure, and it is my firm conviction that the interests of all parties—manufacturer, seller and consumer—will be served by getting away as quickly as possible from the rather misleading (to the layman) designations that have so long obtained in the

THE MOST VALUABLE BUILDING MATERIAL CATALOG EVER PUBLISHED

MOST VALUABLE

because it has just been published. Contains the latest improvements and articles in the building material line. Most valuable because you will save 25% to 40% on everything in lumber, sash and door, plumbing, hardware, paints and oils. Most valuable because it tells you all about the quickest and easiest way to buy "direct from factory to consumer." You'll be delighted with our methods. Thousands have benefited by our mail order department. You can be one of them by just merely sending coupon below for our latest 1915 catalog. Just look at a few of these prices. Everything in our catalog is priced at a like reduction, and a liberal money-back guarantee goes with every purchase made from us.

GALVANIZED CORRUGATED IRON $4

—Corrugated Galvanized Iron, 2-in. corrugations, 6 to 10 ft. lengths. Brand new and in perfect condition. Per 100 square feet $4.
—This is another illustration of how we can save you money. Remember we ship direct to you and save all unnecessary costs.

PAINTS $1.50 GAL.

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities and sell for the lowest prices.
—Standard House and Floor Points, $1.50 per gal.
—Standard makes of varnishes at 25% off regular prices.

Black Graphite Roof —per gal..... 50c

Standard Roof Points—red, green, gray— per gal..... 85c

Shingle Stain, made from pure ground colors —per gal..... 50c

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.
Dutch Kalsomine 4½c per lb.

$30 WALL BOARD $19

——The finest grade of wall board to be had. Compare this price with what most dealers ask. Made of three layers of moisture proof fibre with asphaltum between, or you may choose the cream white fibre board.
—Easy to lay and costs but $19 per 1000 sq. ft.

BARBED WIRE $1.85

Galvanized American Special Light Barbed Wire, in 80-rod reels, at $1.85 per reel.
Heavy Galvanized Waukegan Barbed Wire at $2.40 per 80-rod reels. Compare these prices with your local dealers. Remember we ship direct and guarantee satisfaction or your money back.

WIRE FENCING at Half Price— Per rod..... 35c

Extra heavy Field Wire, 6-inch galvanized mesh. Perfect condition; 55 inches high, 20 rods to the roll. This is just about half price. Don't pass up this big opportunity. Send us your order, your money back if you are not satisfied.

GALVANIZED POULTRY NETTING 42½c

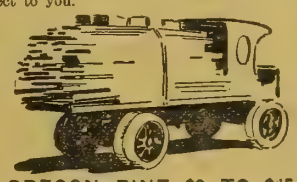
2-inch mesh, all heights—150 lineal feet in a roll—per hundred sq. feet—full rolls 42½c
1½-inch mesh, in full rolls—per hundred sq. ft..... 55c
1-inch mesh, in full rolls—per hundred sq. ft..... $1.00
Any of this netting may be had 12, 18, 24, 30, 36, 48, 60 or 72 inches high.

"STANDARD" ROOFING PAPER

—A Splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet $1.15
2-ply, double-sanded, per roll of 108 square feet $1.40
3-ply, double-sanded, per roll of 108 square feet $1.65
1-ply, "King" smooth, per roll of 108 square feet..... $1.25
2-ply, "King" smooth, per roll of 108 square feet..... $1.50
3-ply, "King" smooth, per roll of 108 square feet..... $1.75

Send for free sample. Remember we ship direct to you.



OREGON PINE $8 TO $15

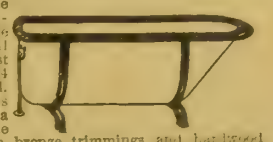
Good new rough Oregon Pine lumber, all sizes, at $8 to $15 per thousand.
Oregon Pine lath, 4 ft., new, $2 per thousand.
Best grade Slashed Grain Oregon Pine, sanded finish, $37.50 per thousand. This make a beautiful interior finish.
These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

SASH AND DOORS

—1-light sash, 40c and up.
Casement windows in pairs with 2 lights, $1.25 up.
Screen doors, $1.25 and up; strongly made of best sugar pine.
A lot of 7-ft. Colonial doors, made of best sugar pine, at $1.50 and higher.
Prices on other material in this line are similarly low.

THIS SPECIAL STEEL ENAMELED BATH TUB $8

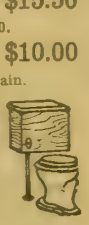
One of the greatest bargains we ever offered! Made of best galvanized 24 gauge steel. Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Priced only $8.



Other larger sizes at $8.50, $9 and $10.

Low Down Enamel Steel Toilet Combination.... $11.50
Complete to floor—wonderful value.
Low Down Vitreous China Closet Combination.... $15.50
Special value—worth $22.50.
Big value in High Tank Toilet Combinations .. $10.00
Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks.
All sizes— up from..... $1.00



Best Quality Porcelain Lavatories; every one guaranteed— $10 down to. $3.75

1607 E. Washington Street

Los Angeles, Cal.

commercial handling of cyanides. I have, for a long time, endeavored to secure the cooperation of the manufacturers and last season they prepared and used a new label, a copy of which follows:

SODIUM CYANIDE
(Technical)
51.0 to 52.0% Cyanogen
Equivalent to 128-130% Potassium Cyanide.
Sodium Cyanide 96.0 to 98.0%
Inert Substances 4.0 to 22.0%
Less than 0.05% Chlorine 45.0 to 48.0% Sodium

"I have also had the matter up, on numerous occasions, with the insecticide laboratory of the University of California, as well as with the proper departments at Washington, and no doubt in the course of time, at least so far as concerns the material that will be used in fumigation operations, the commercial pure sodium cyanide will be sold as 96-98 per cent, and in all probablity (the material now coming out of the factory being of greater purity than ever) as 98-100 per cent.

The confusion of terms has come about naturally through the advance in methods. First potassium cyanide was used. A grade designated as 98 per cent pure was one which had 2 per cent of impurities, matter other than potassium cyanide. Then sodium cyanide was manufactured. It contained a much greater content of cyanogen, which gas is the actual killing agent. But fumigators had been used to handling potassium cyanide, so to explain the greater efficiency of the sodium cyanide, its killing power was expressed as so many times that of potassium cyanide. So one ounce of cyanide of sodium was said to be equivalent to 1.28 ounces of potassium cyanide, or was 128 per cent pure.

Now to get back to a reasonable basis for expressing the strength of a cyanide, it is proposed to use its actual content of cyanogen gas. Then when we refer to sodium cyanide 51 per cent to 52 per cent cyanogen that means a cyanide containing 51 to 52 per cent of cyanogen gas, and we are not bothered by any comparative standards.

Deciduous Fruits

CROP ESTIMATES

MANY more of the apricot growing sections have been heard from, also a few of the peach growing sections. Some of these estimates are given below; more are coming which will be used in next week's paper. Nothwithstanding some sections are showing exceedingly light crop others claim a bumper cone. We believe in general, however, the state will show a much lighter output than usual. We note from reports of the department of agriculture that peach crops of the Southeast and also of the Southwest—the Texas section especially—suffered severe damage from the frosts of late March. The department estimates that in the three states of Carolina, Georgia and Alabama at least 60 per cent of the crop has been destroyed.

California sections reporting are as follows:

J. W. Mills, Farm Adviser Solano County

The apricot and peach crop appear to be far above normal at this time, just how much is hard to state. This is the indication in Solano County. Shot hole fungus is worse than usual, due to the rain and warm weather just after blooming.

Pears got a hard lick in the Vacaville district from thrips. The ground was so wet and soft just when spraying for thrips should have been done that many failed to get the spray on at that time.

Apricots are not through dropping yet, but even if a heavy drop comes there will be a big crop. If no more drop comes nearly every grower will have to thin.

J. H. Ballantyne, Acampo, San Joaquin County

To the best of my knowledge the prospects for cots in this district are good in the different orchards. My trees are well set so far as I have looked.

My Foster and Muir peaches are setting all right but I have been told the Lovells are a little light.

J. C. Metzgar, Secretary Chamber of Commerce, Santa Ana, Orange County

According to the best information I can obtain at this time the apricot crop will not exceed 70 per cent. We grow so few peaches that they are not a factor in any respect.

C. G. Marchus, San Pasqual, San Diego County

As I said in my earlier report, the apricots in this valley are almost a total failure. My neighbor, who usually dries from 20 to 30 tons, said to me the other day that he did not expect to dry any. A few trees are well loaded but most of them are almost barren of fruit.

I have just been through my orchard again and it looks to me as if I will have less fruit this year than the year we received 20 cents a pound. There will not be over one-fifth of a crop in this valley. We should get 15 cents this year.

Wm. B. Jackson, Ontario, San Bernardino County

The apricot crop will be short this year, about the same as last year. A northeast wind hit this valley when the trees were in bloom and that blighted the fruit.

Peaches will be about the same as last year but we cannot tell much about them as yet as they are not far enough along. All other crops are looking fine.

Lester C. Reed, Simi, Ventura County

From my observations for the past 10 years we have about 50 per cent of a normal crop. There was a good bloom but a very poor setting, due some say to rain, others say the hot weather.

After a drive through the Moorpark Valley the crop there looks even less than in the Simi Valley.

A. S. Westmoreland, Valley Center, San Diego County

As to the apricot crop for this year, judging from my own orchard, there will be a bumper crop. Trees are heavily loaded.

Fair crop of peaches, with prunes in full bloom. Too early to determine results as to prunes, but prospect good.

AMERICAN FRUIT TRADE

The foreign trade of the United States in fruits and nuts, $92,840,172 in the calendar year 1914, has doubled in the last decade. Imports were $59,231,394 and exports $33,608,778, including in each case trade with Hawaii, Porto Rico, Alaska, and the Philippine Islands.

Bananas, with a total of 16 million dollars; lemons, 5¼ million; olives, 2½ million; grapes, 1½ million; pineapples, 1 1-3 million; currants, 1¼ million; preserved fruits, 1 million; and figs, nearly 1 million dollars, are the leading classes of fruits imported. Cocoanuts, copra, etc., 5¼ million dollars; walnuts, 3½ million; almonds, 3½ million; peanuts, about 2 million, and filberts, 1 million dollars' value, are the principal nuts imported.

According to official figures compiled by the bureau of foreign and domestic commerce, department of commerce, imports of lemons have increased about 50 per cent, figs about 60 per cent, cocoanuts have quintupled, and bananas, walnuts, and almonds have doubled in import value during the period under review. Meantime Hawaiian pineapples, mainly canned, of which the imports were not sufficiently large in 1904 to justify a separate enumeration, are now being shipped

RED CROWN

The California Cultivator
Subscription, $1.00 a year

into the United States at the rate of 6 million dollars' worth per annum, last year's total being 2½ times as much as in 1911, while imports from Singapore, which at one time reached several hundred thousand dollars annually, have now nearly ceased. Porto Rican pineapples, mainly fresh, are coming in at the rate of 1½ million dollars' worth a year, as against a little more than half that amount in 1911. While Cuba is the leading source of our fresh pineapples from foreign countries, the amounts received therefrom remain practically stationary and the rapidly growing consumption is being supplied chiefly by canned Hawaiian and fresh Porto Rican pineapples.

About half of our imported bananas, aggregating 47 million bunches last year, were from the Central American states, about one-third were from the British West Indies and the remainder chiefly from Cuba and South America. In normal years France supplies about three-fourths of our imported walnuts, but in 1914 her share was only 13 million pounds out of 30 million pounds imported. Italy, Turkey in Asia, Chile and China rank next as sources of imported walnuts. Greece continues to be the great source of our currants imported from foreign countries, having sent to our ports practically 32 million pounds last year, as against 300 thousand pounds from the rest of the world. Asiatic Turkey furnished American markets with nearly 30 million pounds of dates, while 2¼ million pounds came direct from other Asiatic countries and 2½ million via English ports. Turkey in Asia also is the leading source for our imported figs, imports therefrom in 1914 being 13 million pounds, as against 3 1-3 million from Greece, 1 million from Italy and smaller amounts from Egypt, French Africa, and Hongkong. Our imports of grapes range between 1 million and 1 1-3 million cubic feet annually and all of them, except negligible amounts, are from Spain. Italy occupies a similar position with respect to our imported lemons, having supplied between 140 million and 150 million pounds annually during the last few years. Spain sends us between three million and four million gallons and Greece about one million gallons of olives annually, while Italy, also an important producer of olives, sends us less than a quarter million gallons of olives annually, but ships to our shores large quantities of olive oil.

Foreign-grown oranges are gradually being excluded from the domestic market, the diminished imports of that class ($52,860 worth in 1914, against $756,224 in 1900) coming now chiefly from Jamaica. Turkey ranks first and Spain second in supplying our imports of raisins and other dried grapes, while European countries send us most of our imported preserves.

In certain lines the growth of exports of American fruits has been remarkable. Oranges have quintupled in ten years ($831,260 in 1904; $4,225,991 in 1914) largely as a result of the expansion of the California and Florida citrus fruit industry. Prunes have also scored a big gain over the average for earlier years, though when 1914 is compared with 1904 a decrease is apparent, since both those years were abnormal—the figures for 1904 ($3,634,942) being twice the annual average for the four next succeeding years and those for 1914 ($2,582,560) but half as much as those for 1913. Apricots ($1,598,405 in 1914) and preserved fruits ($5,777,991) have doubled in export sales in the decade.

PLUGGING TREES

(Continued from Page 483)

potassium, especially on elms and black locusts, I am convinced it is a valuable remedy.

"The article above referred to gives the general impression that cyanide of potassium is the cause of tree death as well as various staining effects found in the bark, cambium, etc. My opinion is that the staining comes from the reaction between the tannic acid found in all trees and the iron found in this so-called "tree food" in the form of iron sulphate. It is well known that when solutions of tannic acid are brought into contact with iron or any iron salt, dark colored compounds resembling ink are formed. These are very permanent dyes and no doubt account for the dark color observed.

"The cyanide of potassium as I have used it for years in eliminating borers from various trees has never caused any staining, nor have I ever known of its killing or in any way injuring a tree. I have been using it and prescribing it for the use of others for about 12 years in connection with my forestry work, and we have saved the lives of thousands of trees by means of it.

"Large groves of thrifty elms and black locusts in Kansas and other parts of the West have been completely rescued from the attacks of boring and girdling insects by means of cyanide of potassium, and this article is the first intimation I have ever had to the effect that it is deleterious to tree growth. I am strongly inclined to feel that the blame is not properly placed and that a highly useful chemical for insect eradication is being condemned because of damages produced by other substances.—C. H. Shattuck, University of Idaho."

For much of the information given above we are indebted to Prof. J. Eliot Coit, who has forwarded clippings to us.

Firestone

Producing the Proof in Quality and Price

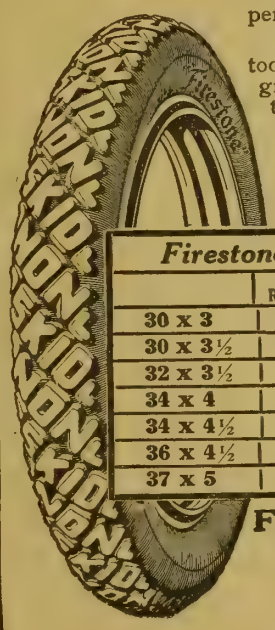
HERE they are—plain as day—the "extras" in Firestone Tires that cost you nothing extra!

Examine the section—note the piled-in values you get at average price; you need the extra fabric; you need that cushion stock—there isn't any in the average tire; why do without it when the cost is the same for Firestones?

The reason why Firestone Tires deliver so much more Mileage is in the "extras" you see here. And the reason for these "extras" is in the Firestone production—a simple business question of making and selling. Nobody can equal Firestone in Economy of Manufacture and Distribution.

Firestone Tires are made in the Largest Exclusive Tire Plant in America; they are made by experts whom "practice makes perfect"—this saves you money.

Firestone methods of marketing are so managed that you get the tires, tubes, accessories—whatever you need in tire service—with least handling and expense—this saves you money.



Examine the section—remember, too, that you get the same relative degree of Mileage no matter what size of tire you buy. The values are there—beyond question or dispute.

Your dealer has Firestones—for motorcycle as well as automobile. If not, he can get them easily.

Your Grandfather

too, knew this trademark. So will your children's children. For 72 years it has been a famous name — a symbol of satisfaction. No other automobile has the same pedigree.

And today—what does it all mean to *you?* It means that once you know the CASE car—you'll want no other. For it's that famous car of "hidden values"—beneath the excellent lines of its body is real "stuff"—it's the kind of car that stands up day in and day out—on good roads and bad, on ups and downs—covering millions of miles all over the world. All rough roads are smooth roads in a CASE, with its deep upholstery and cantilever springs.

A Friend Indeed

It's a companionable sort of car—you can always depend on it. So it is a particular favorite among those who know CASE machinery, just because it *is a Case car.* In this car you find a permanent friend—one always at your service. It is built to *wear*—that is why its hidden parts are made with unusual sincerity.

But all its value isn't hidden—its beautiful lines, its extra equipment, its great comfort speak for themselves. Women folks all like the CASE car. Then let us tell you fairly just what it will do. Nothing could satisfy you more.

Least in Price

Of popular priced cars the CASE car costs you least, we maintain, because we include extra accessories to the value of $110.25. These you'd have to buy later. If we left them out—as others do—the price would be $1,239.75. Including them our price is $1350, with 5 per cent off for cash. The CASE car has all the equipment other cars have—but also an Extra Tire and Tube on Rim with Tire Cover, Weed Non-Skid Tire Chains and 8-Day Clock.

Remember, too, that we *save thousands*—where others must *spend*—in selling, because our cars are sold by our own organization.

Where we spend these savings to make better cars is shown in our new illustrated catalog describing the CASE car. Send for this book—know the CASE car. Write today to Department 523.

Eighth St. and Santa Fe Ave., Los Angeles, Cal.
Also Manufacturers of Galvanized Iron Tanks.

General Agriculture

THE SMALL TRACTOR IN FARM PRACTICE

TO attempt to define the status of a machine which is undergoing so rapid a process of development as the farm tractor is difficult, as its status changes with each improvement or modification. Eighteen months ago the farm tractor was a comparatively large and expensive outfit and might truthfully have been said to have no place in the operation of the medium sized farm of the general type. Now, however, the type of tractor most prominent and apparently most in demand by the farmer is a small, low-priced outfit, capable of pulling from two to four plow bottoms, and with belt capacity sufficient to operate any of the machines commonly used on the average farm.

These small tractors are of simpler construction than the large ones. Most of them have only one drive wheel and usually only one speed forward and one reverse, thus eliminating considerable gearing, including the differential gears. At the same time they permit the hitching of a two-bottom gang plow directly behind the center of draft of the machine, something which was impossible to accomplish with a wide tractor having two drive wheels without causing side draft or running the tractor partly on the plowed land.

The mechanical features are not so important from the farmer's viewpoint, however, as its low price. The average farm already has as large an investment per acre for power as conditions will justify, and the purchase of a tractor which would not displace its money equivalent in other power would be unwise. As a tractor's working life in years is usually only about half that of a horse, it is evident that it should displace practically double its value in horses, if it displaces no other source of power. As a rule, however, the small tractor will take the place of a stationary engine for operating the various farm machines, and the difference in the cost of such a stationary engine and a small tractor is slight; so it will not always have to displace horses to any great extent to justify its purchase.

Judging by data already obtained in a study of the small, low priced farm tractor, it is safe to predict that it will soon command, on the ground of economy, a permanent place on the average farm. The degree of success which will be attained with a tractor depends very largely on its operation and the general management of the farm work so as to utilize it to the greatest advantage. Like every machine, its value is increased by being worn out as rapidly as possible in profitable work, as the interest charges are thereby reduced, and depreciation, through rust, etc., reduced to a minimum. The work of the farm should, therefore, be planned so as to use the tractor wherever practicable and to dispense with as many horses as possible. As the tractor will be capable of doing practically all the plowing on the average farm, the number of horses which must be kept will depend upon the amount of cultivation, etc., to be done, for which the tractor is not adapted. Where the tractor is used the cropping system should be planned to reduce this kind of work to a minimum.—A. P. Yerkes, Farm Management Service.

A WISE INVESTMENT

Paint pays good interest on the investment when well done and with good material. It pays, first in preserving the wood, keeping it from shrinking and warping, and second, it makes all buildings more sightly, therefore answering a double purpose.

This is especially true in our present day because much of our building timber is defective. Our grandfathers when building could go to the forest and cut the choicest black walnut for siding and for the rest the best of oak. The lumber shipped in has not the lasting qualities of our native trees mentioned. Do not understand that paint will make bad lumber good, but it will preserve it and keep it from deteriorating as it would without.

Paint should be applied when weather conditions are favorable, when the atmosphere and the surface to be painted is as free from moisture as possible. The paint should be evenly applied and the oils well rubbed in.

Twenty years ago we built a modern 12-room country residence on a 30-acre farm. We had this house painted as it went up, on the outside. We paid a lump sum of $115.00—painter furnished al material—and this also included the glazier work. The glass was laid on putty and then puttied in. The inside work was finished with yarnish and had stood some 10 years and still looked fairly well when we had it done over again with the same kind of material, but by what proved inferior workmanship. The mantels the painter declined to attempt, said he could not better them.

How often to paint depends on climatic and other conditions. A house in a city where all soft coal is used for fuel, or one near a depot will need painting two or three times as often as a house situated in the country where mostly wood is used for fuel.

SMUT

The state experiment station at Pullman, Washington, has for several years been investigating the troublesome smut problem of the wheat growers. This question is one of the most important agricultural problems of the state. The farmers of the wheat belt lose millions annually from this pest.

The station has just published a popular bulletin, setting forth some of the results obtained in the investigations of the last two years. Many of the results, from the very nature of the problem, cannot be conclusive. All are very suggestive and some of them will be found very helpful to the farmers at the present time, especially some of those with reference to seed treatment.

Recommendations are:

First, that the seed be treated with copper sulphate (bluestone) one pound plus sodium chloride (common salt) one pound to five gallons of water. Treat in this solution 10 minutes.

Second, it is recommended that this treated seed be tested for germination in order to ascertain the amount to be sown, as seed which has been machine threshed is likely to show a large percentage of injury.

Third that, if formaldehyde is used, it be used in proportion of one pound to 40 gallons of water, for 30 minutes.

Fourth, that in case of either treatment the grain should be immersed in an open tank and thoroughly stirred in the water until all smut balls float to the surface to be skimmed off.

It must be borne in mind that the results given in this bulletin are not final. The investigation is being prosecuted with renewed vigor from every angle; from the standpoint of seed treatment, soil treatment, breeding, general biology of the smut plant and methods of infection.

The station for the past two months has been carrying on a searching investigation in regard to the relation of smut to the explosions occurring in threshing separators. A report of this work is in press and may be had for the asking.—Ira D. Cardiff, Director.

WHAT ONE GALLON OF GASOLINE WILL DO

It is difficult to realize the amount of stored energy in a gallon of gasoline, says H. L. Thomson of the department of agronomy at Oklahoma agricultural and mechanical college. In a gallon pail it looks very small, but when burned in a small two or three-horse-power engine the amount of work accomplished is surprising. Even though so much work

HERCULES POWDERS

Better, Bigger Crops with the Help of Dynamite

ON the modern farm dynamite has become recognized as an important factor in producing bigger and better crops. In every field of agricultural labor this comparatively new-found power is proving its great worth. By its aid the progressive farmer is planting trees, draining land, digging ditches, removing rocks, subsoiling land, excavating cellars, cisterns, etc. These things can be done more quickly, more thoroughly, and with less expense than by any other method when you use

HERCULES DYNAMITE

In tree planting and sub-soiling especially, it has proved itself of remarkable value. Farms that were thought "played-out" are now producing better crops than ever because of Hercules Dynamite. Sub-soiling has brought them renewed fertility. When you depend upon the plow alone to prepare the land, you merely scratch the surface. Herclues Dynamite by means of sub-soiling loosens the earth to a depth never reached by a plow. It breaks up the hard lower strata, thereby improving the drainage and giving the crops the fresh, rich subsoil upon which to thrive.

Get Our Valuable Book Free

"Progressive Cultivation" written in a plain understandable style, tells how to increase your crops greatly by this simple and inexpensive method. Also tells of the other money-saving uses for Hercules Dynamite on the farm. Whether your farm is large or small, you need this book—and it's yours for the asking. Write today.

The lazy woman never makes a very successful flower grower.

is accomplished, four-fifths of the energy in the gasoline is wasted in the best engines—in friction cooling and the exhaust gasses. Yet in a good engine it should give 10-horse-power hours or run a one-horse-power engine for a 10-hour day.

Tests have shown, says Mr. Thomson, that one gallon of gasoline used in an engine can do the following work:

Shell 264 bushels of corn.
Grind 486 bushels of corn.
Separate the milk from 300 cows.
Do 20 weekly washings without wringing.
Grind 20 sickles.
Pump 2,454 gallons of water from a 43-foot well.
Pump 1,720 gallons of water from a 159-foot well.
Cut four acres of grain if harvester is drawn by horses.
Bale four tons of hay.
Mix 35 cubic yards of cement.
Carry one ton 14 miles on a small truck.
Carry two passengers in a light car 30 miles.
Plow two-fifths of an acre of average land.
Make electricity for eight lights (15-candle-power tungsten) for 30 hours.
Cut and lift 30 feet four tons of silage with a blow cutter.—Farm and Ranch.

USE AND CARE OF FILES

The choice of a file for any particular piece of work will be determined by the form of surface to be worked, the amount of material to be removed, the nature of the material, and the finish to be left on the surface.

From the 20 different standard forms and cross-sections in which files are manufactured, the user must choose the proper form of file to best fit the work in hand. Next the amount of material to be removed will determine the size and coarseness of the file. The size being the length in inches of the file body without the tang, and the coarseness depending upon the six grades of cuts—rough, coarse, bastard, second-cut, smooth and dead-smooth. The bastard and second-cut are the grades must used for general work and the smooth or dead smooth for smooth finish work. All of these forms may be had as either single or double cut in any grade of cut, excepting that the rough cut is usually single and the dead smooth double cut. The double cut file will bite more freely and leave a more broken surface than a single cut file of the same size.

The nature of the material worked determines in a large measure the "life" of the file. A new file should never be used on very hard material such as scale of castings and forgings or on hardened steel. Nor should it be used on soft tough metals or on thin edges where it bites too freely. Files should not be thrown into drawers together with other tools. They should be kept clean by brushing and should never be placed where they will rust, as that will ruin any file.

A good file handle is necessary for good work. In filing, the pressure is applied to the file on the forward stroke and entirely removed on the back stroke, though the file need not be lifted from the work. As with all metal cutting tools, the pressure should be sufficient to cause it to bite freely as this is easier on the cutting edge than just scraping over the surface.—A. Cammack, Colorado Agricultural College.

WINTER RHUBARB

"Winter Rhubarb, Culture and Marketing," by Reginald Bland, published by the author at San Luis Rey, California.

This is a little book of seventy pages, of convenient pocket size. There are eight chapters touching upon botanical description of various rhubarbs, selection of location for planting, preparation of field, planting, culture, picking and packing, marketing, and propagation and development. It is along a line on which there is but little literature, and to one interested in rhubarb culture it will have particular interest.

My twenty years experience in the roofing business has convinced me that you take no chances with roofing backed up by J-M Responsibility.

John F. Myers
Sussex, N. J.

Hundreds of folks in the southern tier of New York State and over the line in northern New Jersey know what John Myers stands for—and a lot of J-M Roofs up that way back him up, too.

J-M Transite Asbestos Shingles
Fire- and weather-proof, last forever. Highly artistic.

J-M Asbestos Ready Roofing
Weather-proof, fire-retardant, needs no coating. First cost only cost.

J-M Regal Ready Roofing
"Rubber Type" ready roofing for general roofing purposes.

J-M Roofings for every Requirement

Your Roof Becomes Our Roof

when you cover your building with J-M Roofing and register that roof with us.

You may have a guarantee if you want one; but what value is a guarantee without responsibility behind it?

Every foot of roofing we ever made was made not merely to sell but to serve. J-M Responsibility is not a policy. It is a principle.

J-M Responsibility gives this roofing service because our branches cover the country and our representatives are everywhere.

J-M Asbestos Roofings never need painting and last for years. Not only weather-proof but also fire-retardant. Sparks and flying brands will not ignite them.

J-M Asbestos Roofings are examined by Underwriters' Laboratories under the direction of the National Board of Fire Underwriters.

If every J-M roof owner will register his J-M Roof with us, we will see that that roof gives him full roofing service. Tell us what kind of building you have to roof and we will give you our experience with roofs of that kind.

PLANNING THE GARDEN

Written for the California Cultivator
By Ernest Braunton

IN our last talk the reader was instructed in some of the fundamentals governing garden planning. In the present article we will finish the task, setting forth all that prompts the professional when he faces the problem of making a plan for your place or mine.

Plant in masses and not in isolated specimens dotted about here and there; group instead of scattering. Orchards are systematically planted for economic reasons, giving each tree a like amount of space. This insures uniformity of growth and bearing and ease and economy in cultivation, irrigation, and harvesting. No such considerations govern the planting of ornamentals. On the contrary, art, with a due regard for utility, is the inspiration of the landscape designer. Therefore, have tree and shrubbery masses irregular in outline, in gently-flowing curves, not abrupt, nor yet in straight lines.

Trees, shrubs and lowly plants should be grouped, each kind by itself, for nature so disposes them, and we should aim to copy nature. In this way you will not only get artistic and natural effects, but also decided character, for planted in this manner every part of the garden stands for one thing, and one only, and there are no duplications in plan or planting. Therefore, every step forward marks an advance into something new, and from one end to the other "no scene is twice seen," nor anything, either in material or effect met with a second time. It would neither be proper, nor pleasing to find roses and carnations, or pines and acacias scattered throughout the garden, for all parts would then contain similar effects and character. There would be no incentive or stimulus for a walk about a garden where one glance at any part would suffice to show the plants and their disposition obtaining in all parts. Some of the finest examples of beauty in arrangement may be observed in the shrubbery masses on shaded hillsides in the wilds.

Nature makes no straight lines; for whether it be the canopy above, the horizon about us, the shore of ocean or lake, the course of streams, the lines of a horse, bird, or other animal, beautiful curves, in variety, everywhere abound. Without some specific guide, such as a taut cord or a straightedge, man cannot make a straight line. It must then be apparent that nature never expected he should try.

Those who have trampled over freshly fallen snow, though intent upon going in a straight line from one point to another, may easily descry, by looking backward upon their course, the most beautiful and smoothly-flowing curves traced upon earth's otherwise spotless mantle. Even the paths of wild or domestic animals are of most artistic and gentle departure from the monotonous straight line.

Nevertheless, we should not violate the dictates of common sense by instituting a curve or curves in a walk but a few paces long. Curves should not be made that would subject the maker to ridicule, yet they are always permissable and advisable, if it is possible to have them without showing a strained effect or too great abruptness. If it is found to be advisable or almost necessary to make a short or sharp curve, plant in the "bay" a large shrub or tree, or a group or object of a large and permanent nature, made to appear as though present before the path and therefore making the curve a necessity in order to get around this previously occupied point.

Summer Care of Lawns

During even the hottest weather the average lawn is injudiciously watered. Few home owners begin the care of lawns properly or methodically. From the time the young grass appears the inch or two of top soil is given light sprinklings daily, with the result that all roots remain near the surface. If such a lawn goes unsprinkled for even one day during hot weather, it shows distress. After a lawn is well established, water only when the grass needs it and then do it most thoroughly. Then, when the surface supply is exhausted, the roots will go down into the moist sub-soil in search of water. With such treatment the grass will finally reach a condition that if left unwatered for a few days, or even a week, it will not suffer permanent harm.

Lawns should be cut frequently during hot weather, about once a week, for the reason that it is advisable to make the least possible change in general exposure. If left until very long and then closely cut it will suffer from sunburn in both blade and root. Do not needlessly expose the roots to the summer's sun; therefore, during the hottest weather keep the cutter high, leaving the grass rather long throughout the season, but mow frequently, allowing the short clippings to fall down among the standing blades to form a mulch for the roots. If the cut grass mildews or moulds, as it may during cool or cloudy weather, it may be raked off and subsequent cuttings caught in a hopper, but with the return of sunshine remove the hopper and allow the mulch to re-form.

Bridal Wreaths

The spireas, known as Bridal Wreath, are now in bloom and are the most attractive of all deciduous shrubs at this time. In my own garden there are a half dozen; three each of Spirea Reevesiana (properly S. Chinensis) and S. Van Houttei. Both are profuse bloomers and differ but little in any way. At five years of age their good points are so nearly equal that no choice can be made as to which is the better of the two. Either is worthy of a place in the best gardens. Do not plant singly; if you have room enough put in a group of several plants.

A Rare Acacia

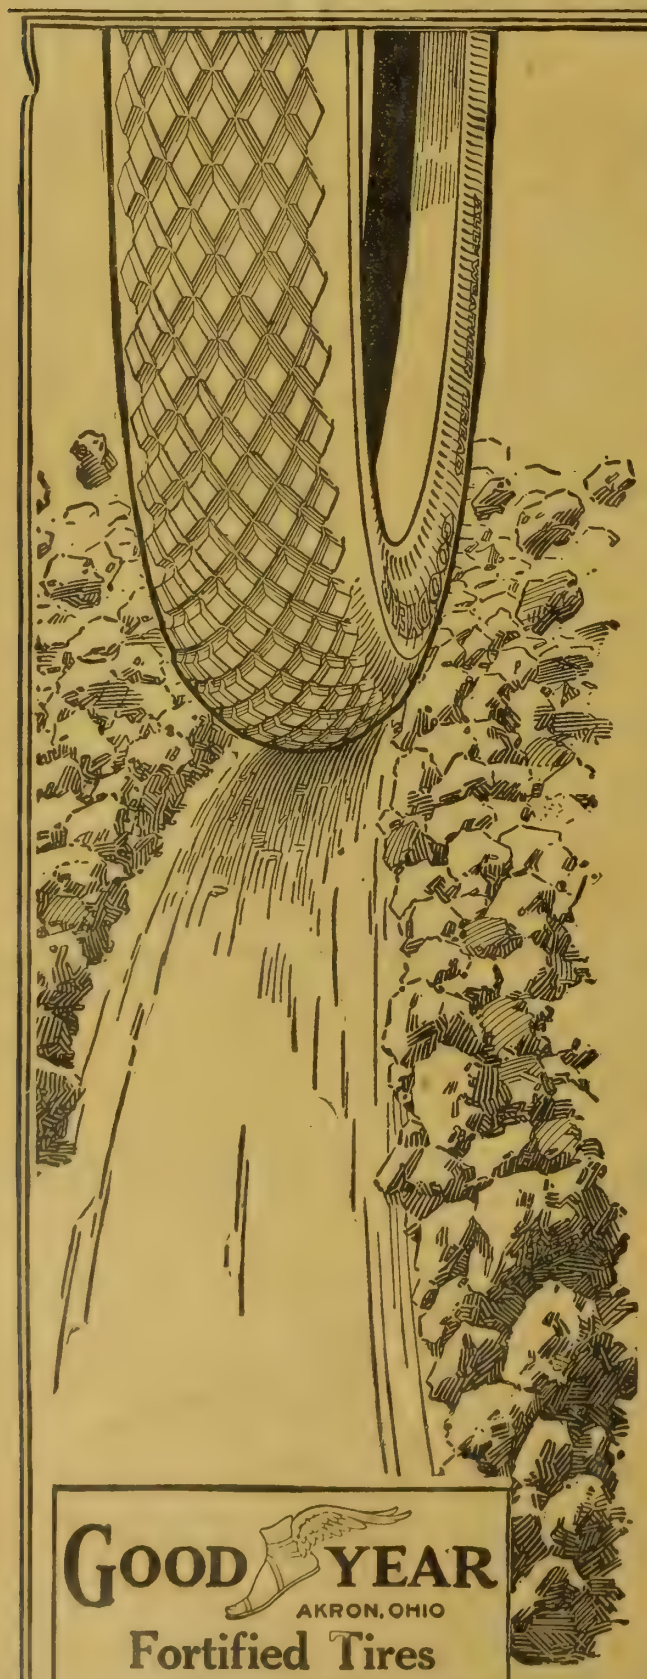
Acacia podalyriaefolia is now passing out of bloom but it was a "blaze of glory" while it lasted. In foliage it differs so widely from any other acacia grown in California and blooms so splendidly that it is a desirable shrub for any garden. Unfortunately it is not so robust in constitution as the average acacia.

While harping on acacias I cannot refrain from saying another good word for A. Cultriformis. This shrub has been particularly beautiful this season. Its small triangular leaves are among the bluest of the blue, so that at all times the plant is attractive. No acacia blooms more profusely and few produce such a deep golden yellow. This latter point is a strong one for some acacias bear flowers of a sickly, faded yellow.

We often starve our flowers—giving them neither plant food nor enough water—and then wonder why they do not bloom.

Ten cents' worth of seeds will cover that ugly outhouse with beautiful vines.

Violets must be given time. They are delicate and do not thrive under forcing.



Fortified Tires
Have Pushed Millions of Rocks from
The Tire Road

Stop and think how Goodyear Tires have held top place for years. There are a hundred rival makes. Yet Goodyear last year sold 1,479,883 automobile tires—about one for each car in use.

The reason is, they are super-tires. They excel in five vital ways. They have brought new enjoyment to hundreds of thousands of motorists. They have saved millions of dollars in needless tire troubles.

Give Them Credit

Don't expect a Goodyear Fortified Tire to be entirely trouble-proof. No tire can ever be. Mishap and misuse affect all of them.

But give Goodyears credit for the rocks they avoid for you, and you are bound to adopt these tires. Note these exclusive features:

Rim-cuts are almost unknown in tires with our No-Rim-Cut feature.

Blowouts due to wrinkled fabric have been ended by our "On-Air" cure. That process, used by us alone, costs us $450,000 yearly.

Loose tread risk is reduced 60 per cent by our patent method. The 126 braided piano wires in each tire base have made the tires secure.

Our All-Weather tread combats punctures, skidding and wear. It is tough and double-thick. It has a sharp, resistless grip.

Lower Prices—Better Tires

Our last big price reduction came February 1st. It was the third in two years, totaling 45 per cent.

Yet not an item has been skimped. On the contrary, we spend $100,000 yearly on experts to find ways to build tires better.

You are wronging yourself when you don't use Goodyear tires. You lose all these extra protections. You are missing all that won this tire the ruling place in Tiredom. Any dealer will supply you.

GOODYEAR
AKRON, OHIO
Fortified Tires

Fortified Against { Rim-Cuts—by our No-Rim-Cut feature. Blowouts—by our "On-Air" cure. Loose Treads—by many rubber rivets. Insecurity—by 126 braided piano wires. Punctures and Skidding—by our double-thick All-Weather tread.

Small Fruits Vegetables

NEMATODE WORMS—EELWORMS

By State Horticultural Commissioner A. J. Cook

THESE little animals are of peculiar interest at present not only to California ranchers but also to farmers in every state of the country. They seem to be present everywhere and attack the roots of hundreds of the common plants, including many cultivated fruit trees, grains and vegetables. These eelworms often cause galls on the roots of weeds and trees and tubercles or projections on potatoes and various other vegetables which roughen the surface and make vegetables unsalable. Prof. E. A. Bessey of the department of botany, Michigan agricultural college, one of the best authorities on this subject, published in the fall of 1911 Bulletin No. 217, Bureau of Plant Industry, department of Agriculture, United States Government. In this publication he gives something like two hundred and eighty species of plants which have been discovered to be infested with these nematodes. There are probably many more yet to be discovered.

Classification

These animals are not insects nor are they true worms. True worms, like seaworms, angleworms and leeches, have a true circulatory system with a pulsating tube or heart, which is frequently double. These nematoid worms have no heart and no circulatory apparatus. They should not be called worms but may be designated as eelworms, nematoid worms or nematodes. They may also be called roundworms in contradistinction from flatworms, or trematodes, which include the liver fluke, a deadly enemy of sheep. They differ from flatworms in having a complete alimentary canal and in being bisexual. Trematodes have no vent to the digestive cavity and are hermaphrodites, each individual being at the same time both male and female. Nematodes include many parasitic entozoa, like pinworms, the common roundworms of man and most of the higher animals, gordii, and even the Trichina spiralis. Many like the potato eelworm are nearly or quite microscopic.

A Bit of History

In January, 1911 Mr. O. E. Bremner, then secretary of the state commission of horticulture, discovered eelworms in a carload of potatoes shipped from Nevada into California. These Mr. Bremner ordered shipped out of the state. In the order he stated that the potatoes came from Canty, Nevada, and were badly infested with a nematoid worm, "a parasitic worm destructive to potatoes which does not exist in this state." In the autumn of the same year several carloads of similarly affected potatoes were shipped from Nevada into California, coming from four different counties of that state. At that time we knew of no such affection of California grown potatoes, though without doubt such existed in this state then. An absolute quarantine was declared against potatoes entering California from these four counties. A committee of experts was at once sent into the potato fields of Nevada to make a thorough investigation of the potatoes of the several sections, as there was no desire to do any wrong to the potato growers in these districts. Moreover potatoes were scarce and prices high. In the interest of consumers I wished to admit Nevada potatoes into California if it were safe to do so. After a thorough inspection the committee reported that the potatoes on many farms were entirely free from infection; others were more or less diseased, but that county or township lines did not separate good from bad.

Infested potatoes are uneven, covered with tubercles, or mammallated, so it is not difficult to detect tubers which harbor eelworms.

The quarantine order was then modified and permitted any potatoes to be shipped into California from Nevada, but in case a single potato harboring the pest was detected the entire shipment must be returned. This worked well, and very few infested potatoes were brought to our markets from Nevada, and these last were promptly returned.

Soon shipments of potatoes attacked with eelworms were received from many districts in California, generally from localities where no Nevada potatoes had been introduced. These reports of infested potatoes continued to increase and the localities to multiply. We now know that the infestation is general throughout the state. Nevada grown potatoes are no more likely to harbor eelworms than are those produced in California.

As the potato eelworm infests 500 different species of plants, it can easily be seen that potatoes may become infested, though no potatoes have ever been grown before in the section and those planted may be uterly free from attack. Almond roots from the eastern part of Sacramento County have been received by this commission badly affected with eelworms, and diseased rutabagas from the gardens of the city of Sacramento have also been discovered. It is easy to see how potatoes almost anywhere may become infested and that any quarantine against eelworm affected tubers will be futile.

For sometime I had felt to question the justness of this conditional quarantine against Nevada potatoes, and this doubt focused December 12, 1914, in Quarantine Order No. 25, which absolutely revokes every vestige of quarantine against potatoes from the neighboring state of Nevada. Two facts made this action imperative: Justice to the citizens of Nevada and self protection. An inconsiderate quarantine, or one declared for purpose of retaliation, would not only dishonor the one declaring it but would also almost surely result in retaliatory action. We cannot call such infestation a menace when products of California are so seriously affected and where weeds and scores of other plants are ever ready to sow the seeds of infection. We regret to say that the same argument holds regarding Fusarium and Rhizoctonia fungi. These are more serious pests in the potato fields by far than are eelworms. In all such cases education is the potent cure. We must use this to the very limit. I am sure we can and will make this succor us in this time of need. With it as partner we may raise the potato production of the state to the old standard of three or four times the yield of the present time.

BOOK FOR YOUNG GARDENERS

"Harper's Book for Young Gardeners, How to Make the Best Use of a Little Land," by A. Hyatt Verrill, published by Harper Brothers, New York, at $1.50 net. Almost 400 pages of valuable information for the young or the inexperienced gardener. Its first appeal seems to be to the youngster or the gardener on the city lot but its information is so general that for the gardener on the back end of a city lot or in the larger garden of the farm it has a fund of valuable information. It treats immediately the practical side, touching lightly the botanical or scientific end. In fact, in its introduction we note:

"A thorough knowledge of botany and of scientific terms is not essential in this form of simple gardening. It is far more important to know what to raise, how to raise it, what soils are best adapted to certain plants, and exactly what returns one may expect from the land and means at command.

"The kitchen garden is today more economical and profitable than ever. The superior quality of home grown vegetables and the satisfaction of growing them more than repay all the trouble and expense even if no real profit is made. For this reason detailed directions for home vegetable

(Continued on Page 503.)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

STRAWBERRY DAY

Gardena, near Los Angeles, invites the world to come and accept her hospitality and eat strawberries—that "fruit which God could have made finer but didn't"—on Saturday, April 24. Besides strawberries there will be parades, games, oratory, etc.

ORGANIZING

There never was a period in the agriculture of this state when there was such general interest in cooperation. Whether this comes about from choice or necessity is of little moment, though we recall that G. Harold Powell, in his book, Cooperation in Agriculture, makes the point that cooperation to be successful must come from necessity. So long as we get cooperation we will be satisfied, or at least we think that we will, for the reason that cooperation is reasonably certain to bring success to agricultural practice. We would not, however, for a moment carry the idea that all cooperative effort has succeeded, but from cooperating fruit growers in Happy Valley in Shasta County, and cooperating dairymen in Humboldt, Napa and other counties, on to the southern line, there are organizations being perfected in nearly every county in the state. On our live stock page reference is made to the work of the Yolo County Swine Breeders' Association. In Southern California the dairymen are organizing to secure a living price for their product.

SWEET PEA DAY

School children of California have been invited to enter into a contest at a sweet pea show to be held in the educational building of the Panama-Pacific Exposition, May 22. Many sections of San Francisco in particular will enter into this contest. Messrs. C. C. Morse and Company of San Francisco, who are encouraging this exhibition, write; "From present indications the exhibition is likely to be a very good one and a most interesting one."

RAISIN DAY

Friday, April 30, is the day on which we will all eat raisins. A look at our household page will show that our request for recipes has been noted by many subscribers, but unfortunately the small number we are able to publish this week gives but a taste of the feast which would be spread before our readers if space permitted us to use all that were sent. In fact, less than one-third of the recipes which were placed in type have been used in this week's paper. Another week will see the remainder. And be sure many tasty dishes will be cooked because of these formulas which have been tested by Cultivator readers.

CITRUS CANKER

We trust California will never have occasion to treat its orchards as Florida has been compelled to, as is shown on citrus page of this issue. Florida is fully awake to the fact that she must have more rigid quarantine measures, and we presume it will be a long time before another pest as serious as the citrus canker will be introduced within her boundaries, but her energies at present are almost entirely given over to the matter of eliminating, or at least reducing, the awful ravages of the canker pest. The present session of the legislature has been asked to appropriate $125,000 for this purpose. The Florida State Horticultural Society has already spent about $75,000 in the work. The federal department of agriculture has contributed something like $25,000, and the cry is coming from all sections of the state: "Give us experts to visit the groves and search for the infected trees that they may be destroyed," and still the pest is spreading with lightning-like rapidity.

Harold Hume, one of the authorities on citrus culture in Florida, has stated that "Unless something is done at once to stamp out this citrus canker, the orange and grapefruit business in this state will be wiped out in five years and possibly within three years."

Californians may be restive under some of our quarantine regulations. Certainly some outside of our state have been, but our very existence as a fruit producing section stands upon even more rigid enforcement of quarantine regulations.

FAKER OR SCIENTIST?

We call attention to a bit of history and present day comment, which appear on leader page of this issue of the Cultivator, as to methods of insect control. In addition to a quotation from an article in the Cultivator of a dozen years ago we quote from the organ of many scientists in this country regarding the same old method once declared a fake. Now we note in a recent issue of The Farmers Guide, published in Indiana, a column and a half editorial entitled, "Another Fake Exposed." This calls attention to the fact that many orchardists are being caught by claims which are absurd. One investigator says: "I have yet to see the first case of San Jose scale, pear blight or, for that matter, any other disease attacking trees, cured by any material of this kind, applied in this way. All we have tried have been fakes, pure and simple, and so the people were simply paying out good money without getting any returns."

Authorities of the Ohio state agricultural commission are after the so-called fakers who claim that———positively kills San Jose scale, worms, lice, borers, and every insect that feeds upon the leaf, branch, bark, roots or fruit, without injury to either." Another investigator reports:

"I examined quite a number of trees in and around Hicksville that had been treated last spring and summer (1914) and in every case where the treatment was applied to an otherwise healthy tree infested with San Jose scale, I found live scale (Feb. 1 and 2, 1915). In the case of pear blight the diseased portions of the trees had been pruned away at the time of treatment and the outward traces of the disease removed. But even where this had been done most of the trees showed traces of the disease, and there is no conclusive evidence to prove that the blight has been permanently checked.

The Farmer's Guide adds: "Surely, this is evidence enough to convince our readers that not only this particular material is useless but such methods of treatment are unreliable and absolutely worthless. Spraying with the proper solutions and at the proper time is the only reliable way to control orchard insects and fungous diseases. So far, a short cut has not been discovered."

ORANGE PRICES

Because of the present agitation as to prices which consumers are paying for their fruit in various markets the Cultivator has started a little investigation of its own and makes suggestion to each orange grower that he do the same. The feeling is prevalent that the retailers generally over the country are selling at extremely wide margin of profit. This is perhaps true, but we think the profit is not as big as is generally supposed. We have written to Cleveland, Ohio, and other near-by points as to prices which consumers are paying at their grocers for oranges. As yet we have received only one answer—this from G. W. Runyan of New London, Ohio. New London is a place of perhaps 2500 people, 45 miles out of Cleveland, and a market which would secure all of its supply in small lots from Cleveland wholesalers. From Mr. Runyan's letter we quote:

"I have made inquiry of one of our grocerymen regarding oranges. The schedule he gave me is as follows:

Retail prices April 14:
Size 324 retail at 12c per dozen.
Size 216 retail at 10c per dozen.
Size 150 retail at 25c per dozen.
Size 126 retail at 30c per dozen.
Size 80 retail at 40c per dozen.

"California lemons, size 300, extra fancy, retail at 20c per dozen. Florida oranges are not very popular in New London and but few have been sold this year. This dealer states that oranges are sold on a close margin of profit, the dealer getting an average profit around 6, 6½ and 7 cents per dozen."

The above is but one of hundreds of towns within a radius of 50 or 60 miles of Cleveland and all supplied by small express and freight shipments from that distributing center. Can California orange growers enter this great field of distribution and sell at lower prices and still make expenses? Tulare County growers and many in Southern California are planning for an organization which shall reach the consumer. It's a great project which will require thousands of competent men and great capital. We would be glad to see it succeed but urge growers to consider carefully.

Agricultural Notes

The exportation of live stock is Ireland's foremost industry next to that of textiles. Sporadic outbreaks of foot and mouth disease in July of 1914 curtailed the business, but the stock thus compulsorily retained are now bringing much better prices owing to war demand.

Illustrating the difficulties in trade between the United States and Mexico under present conditions: Nearly two years ago a firm in Mazatlan ordered from an American plow company three carloads of plows and other agricultural implements. These articles are still at Nogales, Arizona, no safe opportunity being offered during the two years for forwarding.

During the year ended December 31, 1914, the shipments of soya bean oil from Dairen (Dalny), Manchuria, to the United States totaled in value $397,800, against $334,690 the year previous. This is a comparatively new trade, as the soya bean crushing industry was established at Dalny only seven years ago. Soya bean oil is used here mainly for lard compounds and butterine.

The agricultural department announces that the foot and mouth disease has been brought under control in all places throughout the country, except in New York and Pennsylvania. Illinois has been the greatest sufferer from the epidemic, 57,388 animals having been killed in that state; while the number killed in Pennsylvania was 22,958; in New York, 5,727; in Michigan, 7,799; Indiana, 6,643; Wisconsin, 4,704, and Iowa, 3,896.

Exports of human hair from Hong Kong are a large factor in the trade of that port. Direct importations to the United States are not very heavy because the requirements of the quarantine service on hair coming direct from Hong Kong are very stringent, while the same hair proceeds by way of London or Hamburg with much less difficulty, the result being that a large portion of the American shipments proceed by the European routes.

Reports received by the office of markets and rural organization of the department of agriculture from the Louisiana district, which shipped over 1300 carloads of strawberries in 1914, indicate that the frost of March 21 destroyed three-fourths of the crop already set and will probably reduce the expected shipment of 2000 cars by about one-fourth. The plants are setting another crop, but heavy shipments will be delayed for two weeks.

Hawaiian pineapples, mainly canned, of which the imports were not sufficiently large in 1904 to justify a separate enumeration by the United States bureau of commerce, are now being shipped into the United States at the rate of $6,000,000 worth per annum, last year's total being two and one-half times as much as in 1911, while imports from Singapore, which at one time reached several hundred thousand dollars annually, have now nearly ceased.

The Illinois Manufacturers' Association has decided upon an interesting cooperative scheme for securing business in Russia for members of its association. It will establish a selling agency at Petrograd, or wherever else it may be found advisable. It is anticipated that the collective showing which will be made by Illinois manufacturers in the proposed exhibits at Petrograd will afford perhaps the most powerful advertisement that American goods have ever yet had in Russia.

Agricultural News Notes of the Pacific Coast

Northern California

There is talk of establishing a milk condensary at Woodland, Yolo County.

The California Swine Breeders' Association meets on the exposition grounds, San Francisco, next Friday, April 23.

The strength of the Federated Poultry Association, which was recently organized, is increased almost weekly by the additions to its membership.

Eradication of red spider was discussed at the recent monthly meeting of the Yolo County farm bureau in the offices of Adviser Searls at Woodland.

Construction of the largest silo in the Sacramento Valley is in process at Orland, Glenn County. It has a capacity of 250 tons and is built entirely of concrete.

The report of Horticultural Commissioner Norton of Nevada County shows that over 10,000 fruit trees, mostly Bartlett pears, were planted during the month of March.

Saturday is the date of the annual picnic to be held at the University Farm at Davis, Yolo County. A stock parade, games, picnic and general good time, are scheduled.

Horticultural Commissioner Harney of Yuba County reports a cultivated area in the county of 152,000 acres out of a total area of 400,000. Forty thousand acres are irrigated.

Yolo County proposes to hold a redbud festival. It is also planned to ship boxes of the redbud to different cities for sale. A redbud association has been formed to boost for Yolo County.

On request of the Yolo County Hog Raisers' Association the county supervisors have passed an ordinance providing for quarantine of any premises on which an infectious or contagious disease of live stock exists.

Warning has been issued to the rice growers of Butte County to take exceptional pains to keep rice free from weeds. Foul seed has been offered which it is feared will bring many serious pests into the rice growing section.

Poultrymen representing nearly 50 per cent of Sacramento County's output have organized in the effort to secure better returns for products, and to that end will standardize all poultry products shipped by members of the association.

To stimulate the cooperation of the federal and state governments in the improvement of navigation on the Sacramento and San Joaquin rivers, the assembly today adopted Assemblyman Sharkey's joint resolution requesting Governor Johnson to appoint a commission of three to act in conjunction with a like federal board.

Hop growers of California who are interested in organizing a California hop growers' association met at Santa Rosa recently. A representative from Mendocino County reported that 80 per cent of the acreage in that section has been signed up with the association. In Sacramento County about 50 per cent of the acreage has been signed and in Sonoma County 44 growers, with a total of 1804 acres, have joined the association.

Central California

Kings County is making very large plantings of olives this spring.

The Turlock irrigation district has adopted single tax by a vote of 993 to 260.

Stock men of the San Joaquin Valley are making a campaign against glanders of horses.

Work on the new milk condensary at Salida will commence May 1, according to a recent report.

The Pajaronian predicts the local apricot crop will be between 50 and 75 per cent of last year's.

The Tulare Rochdale Company shipped 826 cases of eggs from Tulare during the month of March.

Dairymen of Los Banos, Merced County, are discussing a plan for establishing a cooperative creamery.

The California Associated Raisin Company has absorbed the packing plants of the North Ontario Packing Company at Hanford and Kingsburg.

California dealers are planning to make big shipments of apples to London. Sixty thousand boxes of Newtown Pippins are ready for shipment.

A bill has passed the assembly which will require that all packages of seeded raisins be stamped with the variety of grape from which they are made.

The supervisors of Tulare County are arranging to take over another bunch of state highway bonds in order to secure advancement of good roads work in that county.

A new road is being planned through the Sequoia national park to connect with the new Tulare County road running from Mineral King to Lemon Cove, Tulare County.

Secretary Hibbard of the Raisin Festival committee has invited 36 organizations of Fresno County and the San Joaquin Valley to take part in the great parade on Raisin Day, April 30.

The Corralitos Apple Growers' Association last year handled 150 carloads of apples. To date more than 300 have been promised this season. The association expects to secure a packing house in Watsonville.

Prof. Bioletti of the University of California college of agriculture addressed growers of Reedley Saturday afternoon on mildew control. The address was given under the auspices of the Reedley chamber of commerce.

Farmers of Chowchilla, Mariposa County, recently dedicated their farmers' clubhouse, the auditorium of which has a seating capacity of about 300. The principal address at the dedication was made by Dr. Thos. F. Hunt of the state university.

A pre-raisin-day celebration will be held at the San Francisco Exposition April 28. The Associated Raisin Company will distribute on that day 10,000 loaves of bread and 10,000 packages of raisins in the California building or the Court of Abundance.

The Turlock Merchants' and Growers' Corporation is organizing its business and will soon send out crop contracts for this season. The association expects to handle all products of the Turlock disrict but will give special attention to watermelons and cantaloupes.

Southern California

The Calexico district is having an invasion of woolly worms.

Escondido, San Diego County, is shipping 3000 dozen eggs daily.

There is agitation for the establishment of a cooperative creamery at Escondido.

Tomato growers of Heber expect an early season with little competition from Mexican fruit.

One hundred colonies of bees were shipped from a Rialto apiary to Idaho one day last week.

The Ventura County Game Preserve Association is experimenting with rice planting on its preserves.

Ventura County still has about 300,000 bags of lima beans in its warehouses and 32,000 bags in farmers' barns.

An effort was made to reduce the bounty on gopher skins in Imperial County but the old bounty of ten cents was retained.

The cutting and curing of hay will be the subject of discussion at many of the local meetings of the Ventura County farm bureau.

At Ventura County Day at the Panama-Pacific Exposition lima bean tie pins will be in order. Thousands of them will be distributed.

A petition has been presented to the supervisors of San Luis Obispo County asking that a county horticultural commissioner be appointed.

An immense steel tower to cost nearly $25,000 is to be erected on a prominent peak of the Sierra Madre mountains near Mt. Baldy. It will be an observation tower for detecting forest fires.

Ventura County bean planters are arranging for a contest open to boys and girls of that county for the best plot of lima beans. The winner gets a free trip to the Panama-Pacific Exposition.

The bean contest committee of the Ventura County chambers of commerce will announce prizes and terms of the contest in a few days. Trips to the Panama-Pacific exposition will be offered as prizes.

Entrymen who have filed on lands of the Colorado desert are hoping that a bill passed just at the close of the recent session of the national legislature may enable their holding their lands until they can secure water.

The people of San Diego are showing their neighborly spirit by making up a special train which left that city last Monday for a week in San Francisco at the Panama Pacific Exposition. The San Diego people will go north by way of the valley and return via the cost line.

A very interesting Farmers' Institute was held in Arroyo Grande on the 13th and 14th of April. Five specialists from the state university discussed practical questions. Dairying, hog raising, soils, planting of deciduous trees, beans, septic tanks, sanitation and the marketing of farm products were some of the subjects discussed. The institute was under the auspices of the local Farmers' Union.

The Coast

Texas is already shipping extensively of spring onions.

Texas reports its pecan crop the heaviest yield in five years.

Experimental planting of sugar beets is being made at Klamath Falls, Oregon.

A rancher at Bisbee, Arizona, has started a poultry plant with 1000 chickens.

Cattle shipments from Silver City, New Mexico, for the past year totalled 14,000 head.

The Salt River Valley will grow about 500 cars of lettuce, celery and tomatoes this season.

Chandler, Arizona, will grow about 300 cars of cantaloupes and Glendale, in the same state, about 250.

The Oregon Onion Growers' Association within the past week shipped 26 carloads of onions to Chicago.

The wool market is holding about 20 cents a pound and sheep raisers are much encouraged at the prospect.

Belend is the first town in New Mexico to have a farm attached to its high school for use of the agricultural classes.

Severe frosts recently visited Douglas County, Washington, but as wheat is not yet heading no material damage was done.

The Oregon hop growers have organized a state association and have signed up 80 per cent of the hop acreage of the state.

The Stevensville, Montana, Poultry Association, has decided on December 15-18 as its next show dates and has voted in favor of comparison judging.

The Cochise County Cattle Growers' Association (Arizona) at its recent semi-annual meeeting elected Fred Bennett president and J. T. Hood secretary.

A temperature of 25 degrees in many strawberry sections of Texas caused great losses to growers and it is feared the peach crop is seriously injured.

Oregon's legislature has passed a law requiring all cattle and horse brands to be registered with the state veterinarian. The registration fee will be $1.00.

The college of agriculture at Pullman, Washington, will have a 100 foot addition to its dairy barn. Other improvements will be made to the extent of $40,000.

Idaho has a new bounty law which provides a bounty of $2.50 for each coyote, lynx or wild cat, $10.00 for each bear or wolf and $25.00 for each cougar or mountain lion.

Recently, three transatlantic liners left Texas City, a port on Galveston Bay, loaded with cotton, worth $2,000,000, for Europe. One bound for Bremen carried 10,000 bales, and two for Liverpool, 26,138 bales.

At the recent meeting of the Washington Fruit Growers' Association plans were made for marketing the 1915 fruit and berry crop. J. O. Norton was elected president and A. J. Milem, secretary and manager.

90% of gas engine trouble has always been due to faults of ignition

The "Alpha" Engine

2 to 28 H. P. Portable or Semi-Portable, Water Cooled or Hopper Cooled

"The gas engine without batteries"

Stops ignition trouble

THE ALPHA IGNITION EQUIPment consists of a gear-driven, positively timed, built-in magneto, which we guarantee will last as long as the engine, and a simple, well built and positive igniter. A hot, fat spark is developed which quickly ignites the whole mixture in the cylinder and enables the production of maximum power from the minimum amount of fuel.

ALL ALPHA ENGINES NOT only operate but **start** on this magneto. It is hard to believe it until you see it done. In starting even the largest size Alpha Engine, only a partial turn of the fly-wheel is required and the engine goes right to work. No fussing or stewing over batteries, coils and spark plugs with which other engines are equipped.

THE ALPHA ENGINE IGNItion system is so much simpler that once you see it done you can do it yourself. No trick about it. If you have had any experience with gas engines you will readily appreciate the great advantage of the Alpha in this respect, and even if you don't know gas engines, an inspection of the Alpha Engine will certainly convince you of its simplicity of construction and the excellence of its material and workmanship.

THERE ARE A DOZEN OTHER points of superiority of the Alpha that are just as important as the advantages of its ignition system, and these the nearest Alpha agent will be glad to explain to you. If you don't know the name of the Alpha Engine agent in your locality, we will be glad to put you in touch with him, or if there is no Alpha agent in your neighborhood we will send one of our own representatives to see you, upon request.

IN ANY CASE, WE SHALL BE glad to send you the finest gas engine catalogue ever printed.

Live Stock and Dairy

YOLO COUNTY HOG RAISERS AWAKE

THE cooperative movement in Yolo County made necessary because of great losses in swine herds has resulted in a most effective hog cholera fighting organization. From notices in various county papers it appears that every section of the county is fully alive to the need of a cooperative attack on this disease. Circulars are being sent to all hog growers and from some of them we take the following hints:

How Disease Is Started

Practically all of the excretions of a hog sick with cholera are virulent, and when brought in contact with well hogs will produce the disease. Such material is scattered:

By sick hogs, even though symptoms have not appeared.

By hogs exposed but not sick.

By scattering excretions or litter of sick hogs.

By shoes and clothing of neighbors or buyers.

By wagons and tools.

By stock cars used for shipping.

By infected railroad stock yards where hogs are loaded and unloaded.

By merchandise and feed, shipped in cars that have contained hogs.

By hogs brought together in one place, as at state and county fairs.

By streams or canals that drain infected pens or to which infected hogs have access.

By dogs, cats, rabbits, buzzards, crows, pigeons and other animals.

By many other ways that make the appearance of the disease an apparent mystery.

To Prevent Infection

To prevent infection of your hogs, place all newly purchased stock in quarantine for fifteen days, and if possible dip them before turning out. Persons coming from other ranches should disinfect their shoes before entering hog lot. Keep hogs in a dry lot with shade, and away from running streams. Clean up yards and pens, disinfecting after any outbreak of disease. Dip hogs two or three times a year, repeating each time after ten days. Have clean water and clean feed, troughs being built on cement floor or a plank platform raised several inches on the ground and frequently cleaned. Charcoal, salt and sulphur should be kept where the hogs can munch it.

When cholera appears notify the Yolo County Swine Raisers' Association, office Board of Trade, telephone Main 4361.

Another set of rules, or "As a guide for the control of members the following code of ethics has been adopted:"

Section 1—Members of this association are expected to cooperate with the county veterinarian and the state veterinarian and farm adviser in effort to control and eradicate cholera as well as other diseases among swine in Yolo county.

Section 2—Every member of this association, whenever sickness occurs among his swine, which appears to be infectious in nature, shall immediately notify the county veterinarian, and the members of the board of control in his district, of the existence thereof.

Section 3—No member of this association shall allow a carcass of any hog which dies to remain upon the ground, but he shall immediately dispose of such carcass by cremation, if possible; otherwise by deep burial in quicklime.

Section 4—Every member of this association, when sickness occurs in his swine, shall promptly prevent access of exposed or infected animals to any irrigation canal, or other stream passing through his ranch. He shall also avoid drainage of infected pens into any such stream or canal.

Section 5—Whenever cholera appears among the hogs of a member of this association he shall have his swine treated with anti-hog cholera serum, and also thoroughly clean and disinfect all infected yards, pens, etc., with a disinfectant of recognized strength, in order to prevent the spread of the disease. He will also allow a placard to be tacked on a prominent place on the fence adjacent to the entrances to infected areas; such placard shall state in plain language that cholera exists among hogs on his premises, and shall warn all people to keep away from the hog pens thereof.

Section 6—Every member of this association shall prohibit strangers, and especially venders of patent hog remedies, from visiting his pens, and he is advised against the use of these remedies.

Section 7—Every member of this association, whenever disease exists among his hogs, shall refrain from visiting the hog pens of other swine raisers in Yolo County, and shall clean and disinfect his hands and change his clothing and shoes after handling his infected hogs and visiting the infected pens, before he holds any intercourse with any other swine raiser in Yolo County.

Section 8—Whenever it has been determined that cholera exists among hogs of any resident of Yolo County, the president of this association shall urge all swine raisers whose hogs are in imminent danger of infection therefrom, to allow such hogs to be immunized with anti-hog-cholera serum.

Section 9—Every member of this association shall have displayed in a prominent place on a fence near the entrance of his premises, a stenciled sign reading as follows: "Member of Yolo County Hog Raisers' Association —No visitors allowed in hog pens without permission."

Section 10—Every member of this association agrees to see that the rules of this association and its code of ethics, as well as the laws of the county of Yolo and state of California concerning the eradication of hog cholera, are properly complied with by his neighbors, and each member further agrees that when violations of these rules, code of ethics, and laws come under his observation, he will immediately notify the member of the board of control who lives in his district, as well as the president of the association, and also if necessary, the state veterinarian.

Section 11—As hogs which are vaccinated by the serum-simultaneous method for producing immunity against cholera are, in some instances capable of temporarily transmitting the cholera to non-immunized hogs, every member of this association agrees, whenever his hogs are so vaccinated, that he will permit his premises to be placarded as follows: "Hogs on these premises have been vaccinated with virus and serum—no visitors allowed in these hog pens."

Such a member shall also handle his hogs and prevent the extension of hog cholera infection by personally changing his shoes and clothing and disinfecting his hands as provided in Section 7 of this article.

Section 12—The members of this association agree to neither buy or sell any hog that has been included in any infected herd until at least the date such quarantine has been raised by the proper authority.

Section 13—Every member of this association agrees, whenever new hogs are brought onto his ranch, that he will place said hogs in a separate quarantine lot or pen for a period of fifteen days, and that he will dip such hogs in proper disinfectant before turning them with his other animals.

Section 14—Every member of this association further agrees that whenever new hogs are purchased from outside of Yolo County, they shall be placed by themselves for a period of at least thirty days before being turned in with the other hogs.

Panama-Pacific International Exposition

Live Stock Division Barn No. 8, **SAN FRANCISCO**

record for fat production in the junior four-year class of the thirty-day division, by producing in 30 consecutive days 135.546 lbs. fat from 2,664.6 lbs. milk. She freshened at the age of 4 years, 2 months, 14 days.—Malcolm H. Gardner, Superintendent Advanced Registry.

WHAT DO YOUR COWS TEST?

Supposing you know one of your cows has a test of 3.4 per cent of fat for the first month she is milking, have you any certainty of what she will test the next two months or the last two? One cow in the herd may keep at that first test for three or four months running, another may give far richer milk the third month, and the test may increase steadily; or again, with two cows both increasing in the test during lactation, one may increase far more rapidly than the other Hence, at the end of the season one cow may have given considerably more fat than another which gave about the same weight of milk.

It will thus be seen that the question of sampling as well as weighing a cow's milk is of great importance. Neither is it sufficient to sample and test the mixed milk of the herd; individual quality is worth study. It should be plainly stated in addition that the times demand more attention being paid to testing, for the simple reason that the general average test seems to be steadily increasing. As milk is valuable in proportion to its cream, or to its test of fat, it is important for the dairyman to know which are his high-testing cows. He may want a specially rich milk for his own table use; he may want an extra good price when selling a high-testing cow; he may want to raise heifers likely to test at least as high if not higher than their dams; so evidently it will pay him to know the test of each cow he owns. It is a simple matter to take samples on three days per month, and get a composite sample tested once a month.—C. F. W.

WHAT IS BUTTER FAT?

Butter fat exists in milk in the form of very small globules which are suspended in the milk and do not occur in solution, says Prof. G. W. Barnes, farm advisor on livestock of the agricultural extension service of the University of Arizona college of agriculture. These fat globules vary greatly in size with the breed of cows. The composition of the fat which makes up these globules determines the quality of butter which may be produced from the milk. Some feeds produce fats in milk which have a low melting point, while other feeds produce fats which melt at a higher temperature. Linseed meal, gluten meal and alfalfa have a tendency to produce a soft butter fat, while cotton seed meal, cotton seed hulls and corn stover produce a butter with a high melting point. The excessive use of cotton seed or cotton seed meal and cotton seed hulls will give butter a tallow flavor, but when fed in connection with alfalfa hay or bran has a beneficial effect upon the quality of the butter in giving it more solidity, due to the higher melting point of the fat produced from it. Butter fat is made up of a number of oils, some of which are volatile and others non-volatile. The volatile oil makes up about seven or eight per cent of the fat, while the non-volatile oil amounts to about 91 or 92 per cent. If butter is melted and poured into a tall bottle, the different fats will separate to some extent and the difference in the fat can be noticed after it has stood for a few days.

The percentage of butter fat in milk is quite variable with different cows, and it also varies more or less from day to day in the same cow. A cow usually gives a very poor quality of milk for a week or two after calving; then the butter fat becomes practically normal and remains so for a period of four or five months, after which it increases somewhat in the richness of butter fat. It will also vary more or less between the first and last milk drawn each time the cow is milked; the first milk is somewhat low in butter fat, while the very last drawn from the udder will be very rich. Any undue excitement of the cow will have a tendency to disturb the percentage of butter fat in the milk. A dog running through the barnyard and chasing the cows, an irritable attendant who makes a great deal of unnecessary noise, a change of milkers or a change in the weather, may be the cause of the variation of the percentage of butter in the cow's milk. The longer between the milking periods the lower the per cent of butter fat, but the more milk; the shorter between milking periods the higher the per cent of butter fat, but the less milk.

Such variations when they do occur will usually be accompanied by a decrease in the flow of milk at the particular milking. The change of feed might produce a temporary variation in butter fat percentage, but it is impossible to produce a permanent variation in the butter fat by any change in the feed the cow is getting. In other words, it is impossible to increase the per cent of butter fat in a cow's milk by increasing the amount of grain in her ration. It should be remembered, however, that an inincrease in the feed will usually result in an increase of the total amount of milk produced and consequently give an increase in the total amount of butter fat.

GUERNSEY ADVANCE

The first Guernsey cow to enter the advanced register was Glenwood Girl VI, who commenced her record in May, 1900, and completed it in April, 1901. During that time she produced 12,187.33 pounds of milk and 572.30 pounds of butter fat.

The first cow to enter with over 600 pounds of fat was Portia of Maplehurst, who completed her record of 11,622.65 pounds of milk and 602.37 pounds of butter fat in June, 1902, practically one year after the first cow entered the advanced register.

In the July, 1911 issue of the Guernsey Breeders' Journal appears a list of the cows with over 600 pounds of fat to their credit, and there appear in this list the names of forty-one cows, which means that from April, 1901, until July, 1911, a period of ten years, there were forty-one cows who made records of over 600 pounds of butter fat.

There was recently compiled by The American Guernsey Cattle club a list of cows which had entered the advanced register with over 600 pounds of fat in the last year. This list included cows entering the advanced register covering a period from Nov. 15, 1913, to Nov. 15, 1914, and totaled up sixty-one cows, or in other words, twenty more cows have entered the advanced register in the past year with over 600 pounds of fat than entered with this amount in the first ten years of advanced register work in the Guernsey breed.—A. G. C. C.

PRODUCTION COST

Investigations made by the college of agriculture of the University of Missouri show that on 14 farms the average cost of keeping a work horse a year was $88.23. This cost was divided as follows: Feed, 77.4 per cent; labor, 10.7 per cent; miscellaneous, 11.9 per cent.

It was found that the average cost a day for horse labor was 7.9 cents. This cost varies with different months, being 5.2 cents in May and 15.9 cents in February.

The following table gives the hours of labor required to produce an acre of various crops:

Crop	Man hours	Horse hours
Corn	23.92	42.32
Oats	10.83	19.48
Wheat	11.78	21.37
Soy Beans	24.73	36.31
Cowpeas	24.25	40.06

The dollar cost of producing some farm crops was found to be as follows: Corn $13.52, oats $10.87, wheat $12.30, clover $8.10, cowpeas $13.60, soybeans $13.53.

The cost of keeping a milk cow for supplying home needs only was found to be $47.95. This was apportioned to feed, labor and miscellaneous in the following proportions: Feed, 55.92 per cent, labor 37.66 per cent and miscellaneous 6.42 per cent. The cost of

LOOKING for REGISTERED HOLSTEINS?

Of the Highest Quality and of Faultless Conformation

THEN DON'T MISS THE

P. F. Schumacher Dispersion Sale

75 — Registered Holsteins — 75

Ascot Park, Los Angeles, May 12, 1915

They are bred in the highest producing strains and include the highest record cows ever offered at public sale in the West, including White House Belle, 660.2 lbs. milk, 29.27 lbs. butter seven days; Alba Sadie Cornucopia Creetia, 612.3 lbs. milk, 28.85 lbs. butter seven days; a 20-lb. 4-year-old; an 18-lb. jr. 2-year-old.

A great lot of bulls to head your herd. They are faultless individuals, young and well marked and second to none in breeding.

A noteworthy feature of this sale is the fact that nearly 20 cows and heifers will be in calf to TILLY ALCARTRA SON, the famous young herd sire of McAlister & Son's herd, a son of the only cow to make over 30,000 lbs. of milk in one year.

TERMS: $500 and under, cash; over $500, one-third cash; balance, in three equal payments in three, six and nine months' time, with note and approved security and 8% interest. 5% discount for cash on time sums.

I Want to Show You This 40 ACRE EQUIPPED FARM

LAND: Level, clean, strong; no brush or stumps; ready for plowing; between two railroads and within 1½ miles of stations on Southern Pacific and Western Pacific. In the Upper Sacramento Valley.

SOIL: Deep San Joaquin loam.

WATER: Unlimited water at 20 to 25 feet.

EQUIPPED: with a plow, a harrow and a cultivator, a pumping plant complete, trees and seed.

SPECIAL: This land is absolutely above all flood from rivers; the titles are clear and guaranteed; there is no bonded indebtedness; there are no reclamation or irrigation assessments. This is clean, strong land without incumbrance of any kind.

DUDLEY MOULTON

Expert of Agricultural Lands

Twelfth Floor First National Bank Building, San Francisco

keeping a cow on a dairy farm was $85.10.

The cost of keeping a brood sow a year was $25.91. One farmer was able to reduce this cost nearly one-half by using winter pasture crops.

The cost of keeping a hen a year under farm conditions was 65.7 cents.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Barley Beards

One of our cows has a swelling under her jaw. It seems to be in the inner side, under the tongue. She eats and chews her food and seems in good health. Has started to slobber a little. Can this be lump jaw or fox tail?

The trouble must be due to barley beards or the beards from the fox tail grass as, from your description, it only affects the soft tissues.

Lump jaw (Actinomycosis) always attacks the bone and causes an enlargement of the jawbone. It may be that the opening in the mouth where the trouble started is not closed. In that case a little food or saliva will find its way into the opening occasionally and keep up the irritation. The canal through which the beards follow should be washed out thoroughly and tincture of iodine injected through it two or three times a week. If the inner opening is once closed it should heal in a short time. As long as the bone is not affected you can feel pretty safe in using the milk.

Tumor

I have a grey mule about ten years old with a growth on her rectum about the size of a lemon, with a cord that leads back along the rectum. This started about four months ago but never has discharged any pus. I have been feeding alfalfa hay and she is in good condition. The local veterinarian has pronounced it cancer.—Subscriber.

I am inclined to think it is an hemorrhoid or melanotic tumor. Either one is not so very serious. Cancer is very uncommon in animals. Tie a cord around it very tight at the base and if it does not drop off in a few days tie another around tighter. Gray animals are most inclined to melanotic tumors.

Rheumatism

Five-year-old cow had her third calf about two weeks ago. She is stiff and drags her hind legs. She always has good appetite and gives plenty of milk. When eating she can hardly bend over and she is always groaning. Some say she has kidney trouble, and we sent for some medicine for the kidneys but it seems it is not doing her good.—Subscriber, Morganhill.

Pains that can not be located are usually called rheumatism and often yield to rheumatic remedies. Try giving her the following powders: Powdered gentian, six ounces; powdered nux vomica, three ounces; bicarbonate of soda, four ounces. and salicylate of soda, three ounces. Mix and give a large tablespoon once a day.

Leaking Milk

Is there any way to prevent a cow's teats (which have been dilated) from leaking?—Subscriber, Visalia.

Great care should be exercised in dilating the teats to avoid overdoing it, but even if they are stretched a little too much they will usually contract again in a short time. If it continues until she is dry at that time a slight gash with a sharp knife across the end of the teat will form a small scar that will close it all right.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Poultry for Profit

A POULTRY SHOW FOR EXHIBITION PENS ONLY

The Poultry Breeders' Association of Southern California held the first exclusive Exhibition Pen Show ever held in Los Angeles, April 15, 16 and 17 at 409-411 South Hill Street.

The members of the association are true fanciers, and whenever a show is held they are willing to put a shoulder to the wheel and make it a success, and the Exhibition Pen Show was anything but an exception to the regular annual events.

For the time of the year the 28 exhibitors brought out over 50 exceptionally fine pens of birds. All varieties were well represented, including bantams, turkeys and ducks. The Rhode Island Reds with eight pens led in numbers, while the Cornish Indians and Barred Plymouth Rocks tied for second place with six pens.

A large display of fancy pigeons, Guineas, Silkies and Novelty Bantams were entered for exhibition purposes only and added quite a little to the attractiveness of the show.

The coops were neatly arranged and each pen of five birds was assigned to two double coops instead of one double coop as is the case in most shows.

All the specimens shown were in excellent feather, considering the time of the year, and their condition was equal to that of any birds in the big winter shows. The usual old time breeders were on hand and enjoyed a middle of the year gathering.

Credit is due Walter M. Ross of Glendale for the manner in which the show was conducted and for its success, for it paid out well and the attendance was larger than was expected. The supply house, real estate, magazine and other booths helped materially in defraying expenses and also added to the attractions. Ribbons of appropriate design were placed on the winners and the selection of the prize winners was handled by Judges J. L. Harrison, A. G. Goodacre, Geo. E. Masterson, E. E. Emmerson and N. E. Luce. Each was assigned classes and was loud in his praises of the quality of stock shown.

Following is the list of awards as handed in:

Cockerel bred—Barred Plymouth Rocks—1, Goodacre Brothers; 2, Frederick Espe.

Pullet bred — Barred Plymouth Rocks—1 Frederick Espe; 2, W. P. McPherson; 3, Goodacre Brothers.

White Plymouth Rocks—1, A. A. Bamford.

Partridge Plymouth Rocks—1, H. D. Armstrong.

White Wyandottes—1, and 2, M. D. Cartwright.

S. C. Rhode Island Reds—1 and 2, J. L. Harrison; 3, L. A. Schmoeger.

R. C. Rhode Island Reds—1, Lester Payne.

S. C. Black Minorcas—1, Mrs. W. D. Root.

S. C. Buff Minorcas—1 and 2, William P. Williams.

Silver Campines—1, N. E. Luce.

Buff Orpingtons—1 and 2, W. J. Stewart; 3, Goodacre Brothers.

White Orpingtons—1, W. J. Stewart.

Partridge Orpingtons—1, Goodacre Brothers.

Black Langshans—1 and 2; William T. Blakely.

Light Brahmas—1, Fanciers' Exchange.

Golden Sierras—1, Goodacre Brothers.

Speckled Sussex—1, Mrs. C. L. Waring.

Dark Cornish—1, 2 and 3, John D. Mercer.

B. B. Red Game Bantams—1, Fowler & Masterson.

Black Cochin Bantams—1, W. J. Stadlman.

Bluette Bantams—1, Dr. G. Irwin Royce.

Pekin Ducks—1, Mrs. Mary I. Anderson.

Bronze Turkeys—1 and 2, Charles G. Weaver.

POULTRY ASSOCIATION

Poultry producers of Sacramento County recently organized the Sacramento Poultry Producers' Association, the purpose being to raise the standard of egg production and to educate the public as to the different between eggs produced under sanitary conditions and those not so produced. George H. Croley of San Francisco, president of the California Federation of Poultry Associations, addressed the meeting.

Morris Brooke was elected temporary president and W. E. Harris, secretary. Forty-eight members have been signed by the association, representing about 70 per cent of the poultry industry in the county. The following committee on permanent organization was named: C. T. Horgen, L. T. Nillsen, Mrs. J. E. Dunn, Edward Klose and Mrs. A. Mull.—Sacramento Union.

POULTRY QUERIES

Locating Turkey Ranch

In selecting a location for a free range turkey ranch would you recommend the Sacramento Valley with its early and late rains and heavy dews or would you prefer the Imperial Valley with its extreme heat and dry climate? Would there be as much insect life in the latter location? Can you suggest any certain location which is favorable to the truk?—Subscriber, Merced.

If I were selecting a location for turkeys I would choose neither extreme of damp or dry, but the good middle ground of nice rolling foothill land, preferably with some trees and a brook or two. This is merely my preference, however, for, barring the fact that poults are quite susceptible to dampness, turkeys do well almost anywhere in California. I have heard of their being raised with great success in Imperial Valley where lack of natural green feed must be something of a drawback, in Victor Valley, Antelope Valley, San Fernando Valley, on the wheat fields of the San Joaquin Valley, in the interior valleys of San Diego and Los Angeles Counties, almost everywhere, in fact, except in marshy river bottoms. I think you would not make a mistake in selecting hillside land anywhere, but it must be land where you have water enough to raise plenty of green feed, for California hillsides are not very green in summer, and the turkey needs lots of green. The main thing is to have plenty of range and to see that your turkeys roam about and hunt for their food instead of sitting down and waiting to be fed.—J. A. K.

Turkey's Foot Swollen

We have a turkey with one foot greatly enlarged in several places. We've lanced it but no pus came out although it felt feverish. Can you tell us what it might be and what to do for it?—Subscriber, Springville.

I think your turkey's foot has been either bruised or punctured by a sliver or perhaps a bit of glass. Sometimes a witch-hazel compress will relieve the soreness and scatter the swelling. You will need to bandage the foot securely, but not too tightly, and to keep it wet with the witch-hazel for a day or two. If there is poison in the wounds, however, you will probably have to use a poultice to draw the swelling "to a head." Antiphlogistine is good for this purpose or an ordinary bread and milk poultice. When you have drawn it to a head, lance and cleanse thoroughly with peroxide and apply any good antiseptic ointment. Any treatment you would use in your

(Continued on Page 503.)

Tells why chicks die

E. J. Reefer, the poultry expert of 905 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Don't be deceived by appearances. The ground mica in

MICA AXLE GREASE

forms a silvery coating that makes the spindle appear dry and shiny. But this coating is slippery to the touch, for ground mica is a good lubricant in itself. It clings to the spindle and makes easier turning. That's why a little Mica Axle Grease goes a long way. Dealers everywhere.

For Sale—Orange, olive, peach and rice land. Close in, on good terms. Fred Hart, Exeter.

Queries

Morning Glory in Garden

Part of my garden has wild morning glory in it. We have been trying to kill it out, but have not succeeded. —Subscriber, Waukena.

The best remedy for morning glory, especially in a garden, is persistent, almost daily cultivation. To do that one must grow crops which will permit clean culture of nearly all the surface. If preferred to smother the morning glory and let the land lie idle for a time, then cover with several loads of manure, sufficient to give a depth of three to four inches. Morning glory will not live long once it is prevented from reaching air and light. For that reason clean cultivation accomplishes its eradication in a short time.

No Inspection

How should one proceed in shipping grafts or buds into a county where there is no horticultural commissioner and no inspectors?—Subscriber, Vacaville.

A certificate of inspection should be secured from the inspector or horticultural commissioner in the county from which shipment is made. We take it if there is no inspector in the county to which the shipment is made that the railroad company would deliver without any further inspection.

Yellow Leaf of Roses

Kindly advise me what to do for roses where the leaves turn yellow. What is the cause of this trouble?—Subscriber, Bakersfield.

Yellow leaves in a plant are like a pale face in a human being, an indication of some trouble. But like the physician who treats the human the plant doctor cannot prescribe with no more definite information than is given in this question. There is nothing to indicate any fungous trouble, but it is barely possible the scattering of flowers of sulphur over the leaves would aid in controlling any mildew or other fungus, then thorough pruning, followed by spading, fertilizing and general improvement of the condition of the plant would no doubt prove beneficial. Of course, if by yellow leaves the subscriber means a yellow dusty fungus growing upon them, then it is a case either for destruction of the plant or spraying with Bordeaux or other fungicide.

A Foreigner for President

What would the people of the United States do if a man born in foreign lands of American mother and alien father should become president? —Subscriber, Hemet.

The constitution of the United States requires the president to be a native-born citizen, not under 35 years of age, and for 14 years a resident of the United States.

Marketing Belgian Hares

An inquirer desires information regarding shipping Belgian hares to market and the form in which the trade prefers to receive them. We have answered that as a general thing the trade prefers to receive them alive in coops. However, the question was submitted to Mr. R. V. Moore and he answers: "I notice the raisers of hares have no special way of marketing. Some send in crates alive, while others send dressed in sacks. They are killed by hitting them behind the ears with a club, then their throats are cut and they are hung up to bleed a few moments. After that, split the breast lengthwise, taking out all the intestines, leaving only the liver, as well as the skin and head. They are then usually left hanging on nails stuck through the hocks of their hind legs (heads downward) overnight to cool off, before being consigned to market in sacks. It is never advisable to skin before sending to market, as the carcasses dry out and do not look fresh when placed on the sale counters of stores."

Feeding Catfish

We have an excavation which perhaps is too large to call a well. It is 30x18 feet, with a depth of about 20 feet. About a year ago we put in twenty-two catfish. In the early spring there were many small fish, but in a short time they disappeared. Will fish eat their own young, and if so, what can we feed them so we may raise the young ones? Have screen over the pump, which we use to draw water from this supply. The fish which we originally put in the pool have grown rapidly. — Subscriber, Murrietta.

We take it this pool has clean gravel sides and presume there is but little natural feed. If it were more shallow, and water lilies, reeds or natural growth were permitted in the water there would be an abundance of feed, so that it is probable the young would not be eaten. In the absence of these, it would be necessary to feed, and our experience in this matter is not sufficient to enable us to give very definite information as to how it could be done economically. There is a prepared feed for gold fish, and for them bread, rolled oats and similar feeds have proved satisfactory. If any of our subscribers have had experience along this line we will be glad to hear from them. Also regarding the screen over the suction pipe, we may add that it should be very fine to prevent young fry from being drawn in and thrown into the irrigation ditch.

The Household Department

A GOOD TIME COMING

By Emma A. Lente

Oh, the sweet fields, the dear fields,
that we shall wander over;
The meadows we shall ramble through
knee-deep in fragrant clover,
Where buttercups will lavish gold all
along our way,
And the sun will shine with fervor all
the long, glad day.

When the birds will sing at dawn,
their hearts with joy a-quiver,
And the silver mists drift up from
the long length of the river;
When the lilac and the lily and the
glory of the rose
Make a Paradise of gardens, where
the richest color glows.

When the wind is from the south and
the soft showers fall,
And the leaves are all a-glisten, and
the sleek robins call
To mates and nestlings listening, that
the world is very fair,—
Oh, the good time coming; and would
that we were there!

RAISIN DAY, APRIL 30

ALL California will celebrate Raisin Day on April 30. The city of Fresno has been the center of the Raisin Day movement, but we all join heartily in honoring this, one of our richest and most characteristic products. Cultivator readers here offer a number of ways in which it may best be used and most appreciated.

Raisin Bread

Roll raisins in flour to insure even distribution. Soak one yeast cake in 1½ cups of potato water; mix enough flour to make a stiff batter; beat five minutes. Let stand over night. In the morning scald two cups of sweet milk, in which put one rounded tablespoon lard, one tablespoon salt, three tablespoons sugar. When milk is lukewarm mix with the yeast; add enough flour to make a stiff batter; beat about 10 minutes; let rise; when sufficiently raised, add one package of seeded raisins; mix; add more flour and knead until dough is smooth; let rise. Make into loaves and bake one hour. When baked, wet top of loaves with sugar and hot water to prevent the crust becoming hard.—Grace Robinson, Santa Paula.

Fruit Cake

Four cups seedless raisins, two cups sugar, two full teaspoons of cinnamon, one level teaspoon each of cloves and nutmeg, two-thirds of a cup of shortening and two cups of hot water. Put on stove and let boil 10 minutes. Remove from stove and let it get cold or even cool will do. Then add the following: One-half cup of cornstarch, 3½ cups flour. Sift in with flour one rounding teaspoon of baking powder and two level teaspoons of baking soda. Add last 1½ cups of English walnuts. Bake in a moderately hot oven for 40 minutes. Use your own judgment in putting in the flour, for sometimes three and a half cups is too much, and sometimes is not quite enough.—Mrs. Bunah B. Brooks, Hanford.

Raisin Bread

One yeast cake, one-half teaspoon cinnamon, one cup raisins, one egg, two quarts flour, one tablespoon butter, one-half cup sugar, one-half teaspoon salt. Soften yeast cake in a cup of warm milk for one-half hour. Sift flour, cinnamon and salt together. Add egg, raisins, butter and sugar. Then mix in yeast, knead until smooth and elastic, adding milk to soften if necessary. Set over night. In morning knead down, let raise two hours; shape in loaves. When raised double its size, brush with milk and sprinkle cinnamon and sugar over top, then bake in moderate oven about three-fourths of an hour. This will make two loaves.—Esther Richard, Santa Cruz.

Raisin and Buttermilk Bread

Children are especially fond of raisin bread. It is palatable, concentrated food, healthful and mildly laxative. Children (and most adults) crave sweets and this bread supplies this need and thus takes the place of cakes and candies. The following bread may be cooked in a fireless, steamed on top of the stove, or baked in an oven. If baked in a fireless, place the pans between two heated radiators for one hour; or steam three hours in baking powder cans with hot radiator below. It requires 25 minutes in a moderate oven or two hours if steamed on top of the stove.

Sift four cups of flour, one teaspoon of salt, one teaspoon of soda, two teaspoons of cream of tartar and three tablespoons of sugar. Rub in four tablespoons of lard or butter, then add two eggs well beaten, one and one-half cups of raisins and sufficient buttermilk to make a soft dough. Mix well and divide into four small loaves, place in greased pan and bake in moderate oven 25 minutes. If steamed, more milk should be added, as steamed bread requires a softer mixture. Quite often I have substituted sour milk for buttermilk and had very good results.—Ella M. Tarbet, Onarga, Ill.

Raisin Loaf

Three cups flour, two-thirds cup butter, one-half cup sugar, one-half teaspoon salt, one cup raisins, grated rind one lemon, two teaspoons baking powder. Mix dry ingredients, rub in butter, add raisins and lemon rind, mix to a very thick drop batter with cold milk. Turn into well-greased loaf-pan. Bake one hour in moderate oven.—Mrs. Alva Joyce, Orosi.

Sweet Raisin Bread

Two cups bread sponge, three tablespoons of sugar, one tablespoon of shortening, a pinch of salt, and one-half cup of seedless raisins; add enough flour to form one large loaf or two small ones.—Mrs. E. B. Taylor, Modesto.

Raisin Bread

Soak one cake of yeast in one and

A Few Uses for Cornstarch

Suggestions for Housekeepers By a Famous Woman Writer

One of the best-known woman writers in this country on the subject of housekeeping and cooking, Emma Churchman Hewitt, writes as follows:

"During my long editorial service on the Ladies' Home Journal and other magazines I was brought into intimate acquaintance with housekeepers in all parts of the United States, and especially with their work and achievements in cooking. I found that the novice, too, often uses cornstarch only as the basis of a few puddings and other desserts, while the cook of the older generations uses cornstarch a dozen times a day in all kinds of dishes. I found, too, that the experience of up-to-date housekeepers everywhere was the same as mine—that those who had the greatest success with cornstarch recipes always depended upon Kingsford's. They use Kingsford's cornstarch for thickening their gravies and sauces; for giving a fine texture to their bread, biscuits, cakes and cookies; for making their pie crust perfect and flaky as well as for griddle cakes, waffles, cakes, ice cream and other things too numerous to mention."

Kingsford's Cornstarch, costs no more than inferior kinds. It is carried by all good grocers. Try it once and you will use it always.

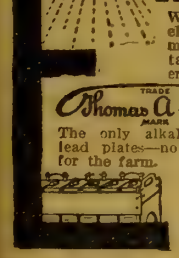
one-half cups of potato water, mix in enough flour to make a stiff batter. Beat well about five minutes. Let stand over night. In the morning scald two cups of sweet milk. Put in this one tablespoon of cooking fat, one tablespoon salt, three tablespoons of sugar. When milk is luke warm, mix with the sponge, add enough flour to make a stiff batter; beat about 10 minutes, then set in a warm place and let it rise. When it is light, add two cups of seeded or seedless raisins; mix, Add more flour and mix till dough is smooth, then let it rise again. Make into loaves and bake one hour. When baked, wet top of loaves with sugar and hot water to prevent the crust becoming too hard, or you can grease the loaves with cooking fat. This makes the crust soft, too.—Mrs. J. C. Rogers, Fullerton.

An Excellent Recipe For Making Good Divinity Fudge

Good divinity fudge, or any kind of candy for that matter, requires strict attention to directions as to quantities and methods. Below is given one of the best recipes known for making this popular confection.

"Divinity Fudge"—2 cups sugar, ¾ cup Karo, ¼ cup water, 2 eggs (whites only), 1 teaspoon vanilla, ½ cup chopped nut meats, ½ pound dates, stoned and cut fine. Cook sugar, Karo and water till crisp when tried in cold water. Beat the whites of the eggs in a large bowl, and pour the syrup slowly onto them, beating the whole till it begins to harden. Add the vanilla, nuts and dates. Spread quite thick on a shallow buttered tin. When cool, cut in large squares.

Excellent recipes for making Caramels, Walnut Caramels, Cream Caramels, Chocolate Caramels, Peppermint Candy, Taffy, Yellow Jack, Cream Drops, Peanut Wafers, Cocoanut Candy, Nougat, and many other sweets too numerous to mention, will be found in a little booklet issued by the manufacturer of Karo Syrup, which can be obtained free of charge at all modern grocers. Ask for it.



EDISON ELECTRIC LIGHT

Why put up with anything else when the best is the most economical to maintain and the easiest to operate?

TRADE Thomas A Edison MARK ELECTRIC LIGHT PLANT

The only alkaline battery—no acid—no lead plates—no cleaning periods. Ideal for the farm.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

Don't Suffer From Ants

A Simple Way of Ridding Every House of This Pest

Many a woman has been driven almost distracted by a house infested with ants. No pest appears to get into a house any easier, or out any harder. All kinds of preparations have been tried in the effort to exterminate them, but without success.

It remained for a sufferer from this pest—a baker and candymaker—to devise a remedy which would not only exterminate ants, but do it almost instantaneously. On the verge of being driven out of business by a swarm of ants—which overran every part of his bakery—he originated a paste which seemed to have almost supernatural powers—not an ant remaining in the place after spreading it around.

So efficacious was the remedy that it has been put up for general use under the name of Kellogg's Ant Paste. Each package has a patent rattle cap, which provides a warning night or day that the contents are poisonous. Ask your druggist for a package of Kellogg's today, and end that ant nuisance forever.

Raisin Roly-Poly

One coffee cup each white and Graham flour (or all white), two rounded teaspoons baking powder, one-half teaspoon salt. Mix well and wet with cream and milk, or milk alone. Turn out on board, divide in two portions. Pat out one-half into sheet one-half or three-fourths inch thick. Spread with seeded raisins, sugar and cinnamon. Roll, pinch edges together, lay on greased plate, steam about one hour. Pat the other into a greased pie plate, rub over with milk, bake in quick oven. Open, butter and spread with stewed raisins or other fruit. Both served with cream. Makes two simple, nourishing desserts.—E. S. F., Madera County.

Soft Graham Raisin Loaf

One cup sour milk, one-fourth cup molasses, one-fourth cup sugar, one and one-half cups Granam flour (fine), one teaspoon soda, one teaspoon salt. two tablespoons melted lard, one cup raisins cut (not chopped) and slightly floured. Let stand ten minutes after putting into pan, then bake 45 minutes.—Annie M. Beals, Corvallis.

Raisin Puffs

One-half cup butter, one cup sugar, two eggs, one cup sweet milk, two cups pastry flour, two teaspoons baking powder, one cup raisins stoned and chopped. Cream the butter and sugar, add the well beaten eggs. Mix together the flour and baking powder and add the flour and milk alternately to the first mixture. Then add the raisins. Steam one-half hour in cups.—Elsie Pedroia, Lodi.

Stuffed Cookies

For cookies—One cup white sugar, one-half cup butter or lard, one egg, one-half cup sweet milk, one teaspoon vanilla, three and one-half cups flour, two teaspoons baking powder.

For filling—One-half cup white sugar, one-half cup water, one cup chopped or gound raisins, juice of one lemon, one teaspoon flour.

Cook filling until thick, stirring constantly. Roll dough very thin, cut cookies round, place in pan and put a teaspoon of filling in center of each. Place another cooky on top of each and bake in a moderately hot oven.—Mrs. L. D. Pike, Fullerton.

MAY PRIZE CONTEST

Have you been successful in canning vegetables? What vegetables have you canned? What has been your method? Have you used a steam pressure outfit, a home made boiler or what? Have you canned for home use only or have you marketed the product? Did it pay?

Cash Prizes

For the best short account $2.00, for the second best $1.00. All recipes published will entitle sender to three months' extension of subscription to the California Cultivator. If you have already received one extension for subscription this year you are not entitled to further extension for recipe furnished. With your recipe send name of member of your family now receiving the Cultivator that extension may be properly credited.

Any suggestions as to further contests are gladly received.

Write Early

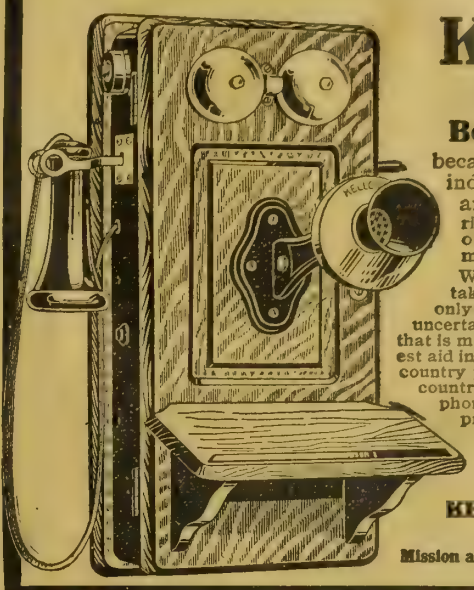
Send in your canning hints early. Please write on one side of paper. All contributions should be in this office by Thursday morning, May 13. They will be published in the issue of May 20.

PRIZE WINNERS

The first prize for April recipes is awarded to Annie M. Beals, Corvallis, Oregon; the second to Mrs. L. D. Pike, Fullerton. Other receipes will be published later.

Final Telephone Efficiency

YOU can get it from the instrument shown here. One of the Kellogg kind. Works on any kind of a line and with any kind of telephone. Rings clearly with 40 telephones on the line. Compact, durable, light. Less wall space. Unbreakable receiver and mouth piece. Lightning arrester. Secret service push button to ring Central without ringing neighbors. No repair bills. 5 year guarantee on transmitter.



KELLOGG Telephones Best in the World

because they are made in the largest independent factory in the world and have to undergo the most rigid tests ever devised. There are 37 of the tests and none but a Kellogg made instrument could stand them.

Why not know real phone service. Why take chance on cheaper instruments that only mean in the end repair bills and the uncertain weak transmission of messages that is maddening. The telephone is the greatest aid in the world in linking up the lines of country people with the whole world, but the country man of today wants the best telephone. Send us your name and we'll prove to you that there is a reason for Kellogg world-wide reputation. Also will see that you get much valuable and interesting telephone information free. *Write for bulletin No. 24*

HAY

Under date of April 17, Scott, Magner & Miller say:

Receipts of hay for the past week were 3471 tons, as against 2606 tons of the preceding week, and 2150 tons the week before. Fancy growths of wheat and red oat hay are scarce and in demand, and an occasional car is sold in excess of our top quotations. The weather has been most favorable for the new crop and farmers are commencing to get their machinery ready to take care of this as time approaches for harvesting in some districts very shortly. The first crop of alfalfa is being harvested in some sections and crop is reported in good condition and from present outlook will be quite heavy. New crop alfalfa is already arriving in the Los Angeles and San Diego markets from the Imperial Valley sections. There is no change to report in the straw market.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (light bales) .... 11.50@12.50
No. 1 Wheat or Wheat and Oat .... 9.00@10.50

Citrus Fruit Market

LOS ANGELES, April 21, 1915.

Material advance has been made in prices over last week's, and this in face of the shipment in excess of 1500 cars per week. The shipments during the first week of April were 1573 cars. The East is generally educated as to the high quality of California fruit, and the consumption for the next four or five weeks will be great.

Lemons likewise are slightly better, though many disastrous shipments have been made because of poor keeping quality.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 18,108 cars, lemons 2,379, total 20,487. To same date last season, oranges 19,899, lemons 1,070, total 20,969. From Tulare County: Oranges 5,209, lemons 189, total 5,398. Last season to same date: Oranges 4,655, lemons 30, total 4,695. From northern countes: Oranges 628, lemons 1. Last season, same date: Oranges 398, lemons 5.

NEW YORK, April 19.—Thirty-eight cars navels, three budded, one bloods and navels, one blood, one St. Michaels and sweets, and three cars lemons sold. Market strong with prices about 10 to 15 cents higher on navels. Lemons unchanged. Fair.

own family for a similar injury is suitable for the turk.—J. A. K.

Poisoned Hens

In the past week we've lost three hens, all of which were apparently in perfect condition until two or three hours before they died. They just seemed to droop and die. Can you tell us what the cause can be?—Subscriber,

It looks as if the hens had eaten something poisonous. Could they have found decaying flesh about the premises or poison that had been put out for squirrels or gophers? If they died on the nest death may have been caused by a rupture of the oviduct in trying to lay an egg. If they were moving about as usual and in perfect condition I know of nothing that could cause such a sudden taking-off but poisoning of some sort. Putrid flesh is one of the deadliest poisons, and some of the meat sold by butchers as "green-cut bone" is nothing more nor less than putrid flesh. I should make a thorough examination of the premises, and see that the hens get no spoiled food of any sort.—J. A. K.

BOOK FOR YOUNG GARDENERS

(Continued from Page 491)

gardens have been given.

"Flower gardens are always beautiful and attractive when properly cared for, and they may often be made remunerative as well. Wild flower gardens, ferneries rockeries, and water-gardens will frequently transform commonplace grounds into works of art, and are a pleasing change from the ordinary type of garden. All of these may be found fully described and illustrated in the chapters devoted to ornamental gardens."

There are 29 chapters in the book touching upon tools and planning the garden, soil preparation, hot beds and methods of growing, storing of vegetables, etc., insects and garden pests, planting of trees, small fruits, grafting, budding, etc.. mushrooms, with several chapters given up to ornamentals, landscaping, growing potted plants, bulbs, and answering nearly every question which would come up in garden practice.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

between the covers

Between the covers of this booklet is a fund of information valuable to every farmer—no matter what kind of crop he raises nor where.

It deals with the problem of hauling-power and emergency stationary power—and presents a solution.

The Yuba Ball Tread Tractor is one of the most highly developed machines of its type. By the use of steel instead of weaker and bulkier materials—high-duty roller and ball-bearings instead of the bronze or babbitt type, and the most efficient power plant and transmission system we can buy or build, the tractor has been made more powerful, more compact and more economical to operate and maintain.

THE YUBA BALL TREAD TRACTOR

This booklet tells how well The Yuba Ball Tread Tractor is designed for work in an orchard, vineyard, hopfield, on grain or alfalfa land, on the road—and so on down the list.

Every page between the covers is instructive and vitally interesting.

As the first step toward bigger profits, fill out and mail the coupon.

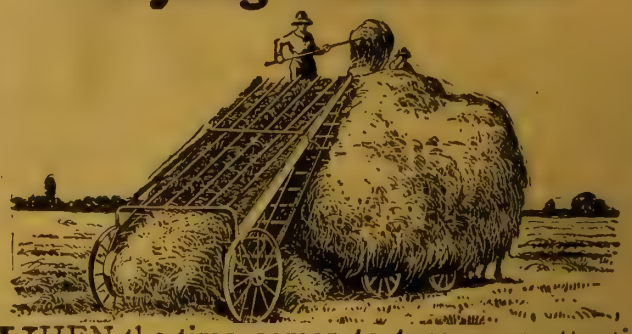
International Harvester Haying Machines



WHEN the time comes to turn your attention and your energies to the hay harvest for this year you will have to take the weather and the hay crop as you find them—but on you and your methods and machines will depend the amount and quality of the hay you get into barn and stack.

As to hay machines, many years of trying out in many fields have proved that you cannot do better than make your choice from the **International Harvester** lines.

International Harvester haying tools are carried in stock or sold by local dealers who can take care of you quickly in case of accident. It is their business to see that you are satisfied with the **International Harvester** haying machines and tools you buy from them. You cannot go wrong if you buy only haying tools with the **I H C** trademark.

Write us, and we will give you the name of the nearest dealer handling **International Harvester** haying tools, and we will send you catalogues on the machines in which you may be interested.

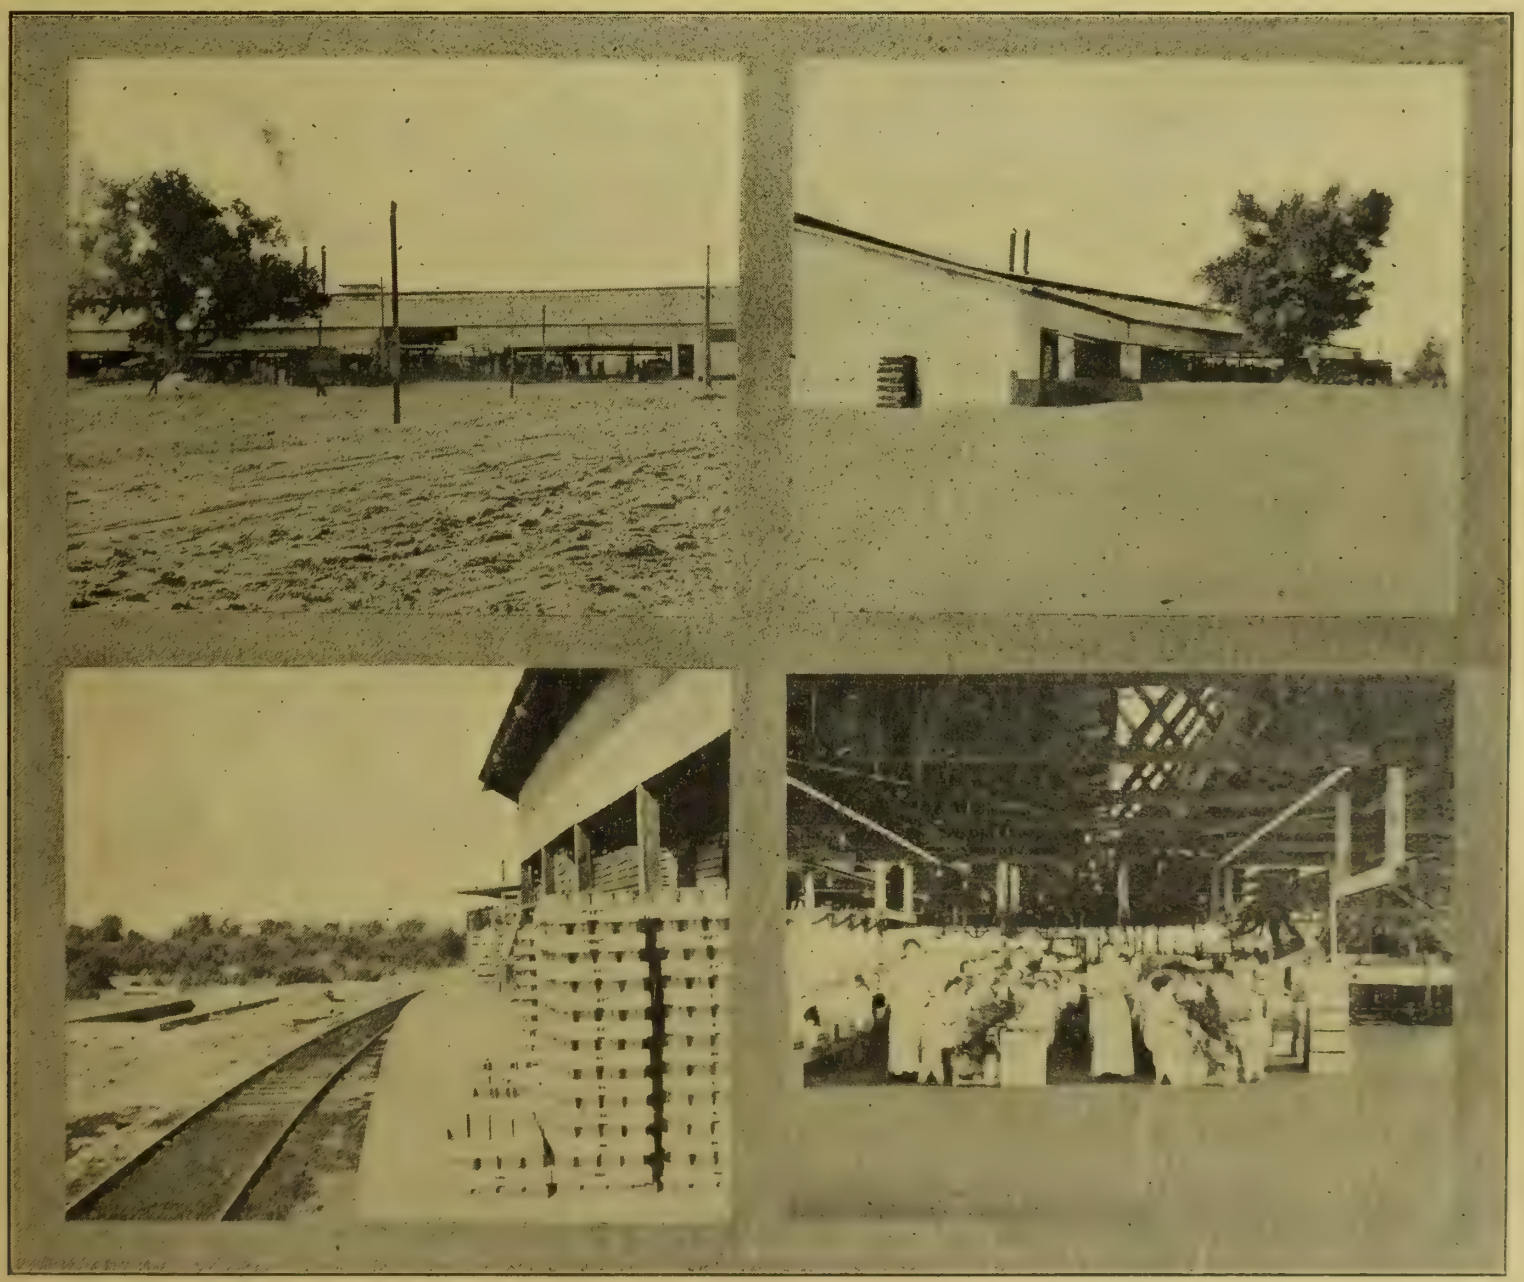
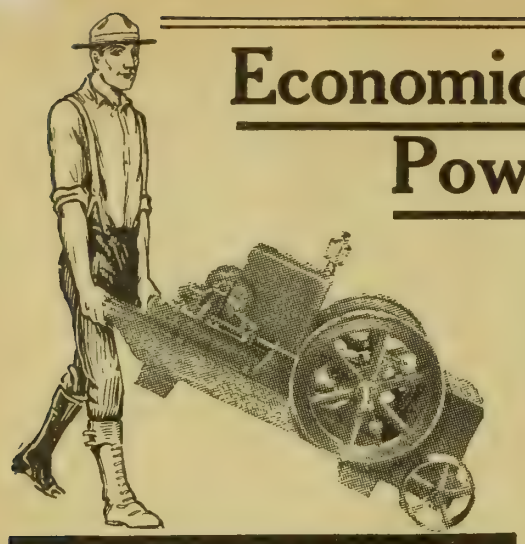
Successful Cooperative Cannery at Porterville

Fruit Growers of Tulare County Have Financed and Operated for One Season One of the Most Successful Canneries in the State. The Pictures Shown Below Give Something of an Idea of This Plant, Which Is Fitted for Handling Fruit in the Most Economical Way. See Article Giving Plan of Organization on Third Page





Economical Power for You

Mr. Farmer—

No longer is it necessary for you to pay out most of your profits for hired labor. You can get all the **power** you need for practically every kind of agricultural work from these **simple** little engines—and move them around—and operate them **yourself**. Each one will do the work of at least three hired men and **save** you the cost of their wages. About 2,000,000 "internal combustion" engines are now in daily use upon American farms. The

FULLER & JOHNSON
Type "N" Gasoline Engine

combines all the good points of high-price engines (up-to-the-minute design, finest materials and unusually high-class workmanship) into a strong, light, durable engine of **moderate price.** There is no need of paying more for an engine than the price of a **Fuller & Johnson.**

For operating an alfalfa or ensilage cutter, cream separator, pump (for household and irrigation purposes) electric dynamo, churn, washing machine, wood-saw, etc., the smaller sizes of the **Fuller & Johnson Type "N" Engine** are ideal. You can also get it in portable sizes up to 15 horse power which will run a threshing machine.

If you want to reduce your "high cost of labor" or increase your profits, don't fail to write for our illustrated catalog giving full details by return mail. Use this coupon to save time.

Cooperative Canneries Conserve California Capital

Account of One Successful Cannery Owned by Fruit Growers of Tulare County Should Induce Other Sections to Move Toward Similar Effort

IT'S a pleasure to see an up-to-date factory with hundreds of hands putting out a food or other product rapidly and in order. It is doubly a pleasure to see this work done cooperatively by the producers of the raw material. It was my privilege last summer to see the first days' operation of the new cannery of the Tulare County Growers' Association, located at Porterville. The building is a large, well-ventilated and lighted structure, fitted with endless carriers, automatic washers, dippers, peelers and cookers. The cutters and packers sat at long, low tables, the center of each of which was fitted with endless carriers which took the filled cans to the cookers. These cookers were set so that the carrier in passing through it brought the fruit out at the other end perfectly sterilized; in fact, except for label, ready for the consumer.

But the object of this article is not to give a description of canning methods so much as to call attention to the organization which built and is operating the cannery. The company is composed of both farmers and business men of Tulare County. The farmers wanted to dispose of their crops to advantage and the business men wanted an institution which would afford employment for many, and besides, wanted the money which farmers would spend if fair returns for fruit crops were secured. Hence the combination.

The first year, in face of exceptional conditions, was a success. The second promises better. We hope the example of the Porterville growers will be followed in other parts of the state. First, however, a word of caution. Investigate fully as to quantity and quality of fruit, capital to be commanded and probable market. Is it possible to secure a keen business man and qualified cannery expert as manager? It is not so much a question of richness of soil of the farm as of richness (in experience and knowledge) of the farmer. Likewise equipment, capital and fine fruit may fail unless in the hands of good directors and manager.

Again as to markets: That's a long question. Excepting under abnormal conditions the consumer usually waits for the goods to seek him. In that seeking of market sometimes lines cross and the merchant finds himself handicapped because some other merchant is seeking the same trade. To meet that competition profits are sometimes sacrificed. Likewise the farmer with a load of potatoes or of canned fruit suffers. We should be wiser.

I trust Mr. Vernon Campbell, who is manager of this cannery of the Tulare County Growers' Association, will not object if I quote a few paragraphs from a recent letter:

"As you are aware, this is my first experience in the handling of cooperative institutions, my experience having been entirely in stock companies' work. I find the principles of cooperation considerably different from those of ordinary corporations and I have a number of things to work out in reference to this business which would not apply to the ordinary growers' associations.

"The grading of fruit is considerably more complicated, it being necessary to go to considerable expense and trouble in order to make each grower his just returns. The matter of costs is quite complicated in this connection as the costs must be properly apportioned according to quality and value of the various products.

"It is our intention to establish a central organization working along lines similar to but closer than the central organization of the orange growers. We do not believe it will be policy to encourage the formation of more cooperative canneries to work independently, for this leads to more competition than we have now at this time. Competition between the various packers is constantly increasing the cost of goods in the East without benefiting the consumer, and as the packers receive less for the goods the price to the grower is less."

More cooperation on the part of cooperators is needed. Members of one organization are too often competing with the members of others. Let us get together.

The officers of the Tulare County Growers' Association are: W. M. Burton, president; H. L. Pomeroy, secretary; G. W. Morrell, S. T. Pennebaker, C. N. Jordan, H. H. Newman, W. D. Tobias, J. S. Linnell, H. E. Spear, C. H. Doyle, G. A. Williamson, directors.

Constitution and by-laws my not be interesting reading, but for other sections which may be contemplating cooperative canneries we give the following as adopted by the Tulare County organization. Mr. Campbell writes that there may be later amendments, but as yet it stands as originally adopted.

BY-LAWS OF THE TULARE COUNTY GROWERS' ASSOCIATION

Article I.

Place of Business—The principal place of business of this association is the City of Porterville, County of Tulare, State of California, and the office of the corporation shall be at such place in said City of Porterville as the board of directors shall from time to time designate.

Article II.

Annual Meeting—The annual meeting of this association shall be held at the principal place of business of this association on the first Saturday in May of each year, at the hour of nine o'clock a. m., and at that meeting eleven directors shall be elected and qualify, and such other business be transacted as shall be deemed necessary.

At such meeting the president of the board of directors shall preside, and in case of the absence of the president the vice-president, and in case of the absence of both, the members present shall elect one of their number to preside for the time being. Immediately after the meeting of said association the persons elected as directors shall meet and cause to be elected one of their number president, and one vice-president, and shall also elect a secretary, manager and treasurer, who need not be members of the association, and they shall also elect from the board of directors and executive committee, consisting of three (3) members, who shall have active charge and control of the business of the association, subject to the approval of the board of directors.

Article III.

Proxies—Each member must personally attend such meetings in order to vote thereat; and no proxies will be permitted.

Article IV.

Other Meetings—The directors shall hold their regular meetings quarterly on the first Saturday of the months of February, May, August and November, and special meetings at any time upon the call of the president; said call to be made by mailing notice or by personal delivery of the same.

The board may call a special meeting of the association at any time by mailing notice thereof to each member one week previously, and one-third of the members shall constitute a quorum at all meetings of the association. The notice shall set forth the object of the meeting.

Should any of the directors cause dissatisfaction a special meeting shall be called by the board of directors within one week at the request of one-third (1-3) of the members of the association. At such meeting if by two-thirds (2-3) vote of the members present the office of any director or directors shall be declared vacant the meeting may at once proceed to elect directors to fill such vacancies.

The absence of a director, unless from an unavoidable cause to be determined by the board of directors, from three (3) successive regular meetings shall be deemed to be and shall act as a resignation, and the directors may proceed to fill the vacancy until the next regular meeting of the association.

Article V.

Powers and Duties of Directors—The board of directors shall have general management of the affairs of the association, authorize the expenditures and constitute the governing power of the association in all matters of business. They shall make all contracts for necessary materials for handling and marketing fruit, and for that purpose may and they are hereby authorized and empowered to negotiate such loan or loans of money from time to time as may be necessary, and by resolution by the board of directors the president and secretary are hereby authorized under the seal of the association to execute such note or notes, in such sum as may be required for such purpose.

They shall by majority vote elect a manager who shall serve at their pleasure, and at such salary as they may determine, and whose actions shall be limited strictly by the board of directors. The manager shall have general charge of the office of the association and of the plant and all property of the association. He shall give his personal attention to the handling, canning and shipping of products and shall see that efficient service is rendered.

Article VI.

Duties of Officers—Section 1. The president shall preside at the meetings of the association and all meetings of the board of directors and shall sign all certificates of memberships, contracts and conveyances and all documents and agreements that the board of directors may, by resolution, require him to sign, and also the minutes of the proceedings of all meetings of the association and directors. He shall have the custody of the bonds of all the officers and employees except his own, which last shall be filed with the secretary. In the absence of the president, the vice-president shall perform all his duties.

Section 2. The secretary shall keep full and precise minutes of the proceedings of the association, and of the board of directors in proper books. He shall countersign all certificates of memberships, contracts, conveyances, documents and agreements, and generally shall perform all duties pertaining to his office as the board of directors may require.

Section 3. The treasurer shall keep full and precise records.

Article VII.

Membership—None but actual producers of fruit or vegetables can be members of this association.

Growers who desire to become members must pay to the assocation the sum of twenty dollars per acre for each acre of fruit or vegetables handled by the association, together with a membership fee of five dollars, and each member shall sign the by-laws.

Any person applying for membership in this association shall be accepted or rejected as the board of directors deem best.

Article VIII.

Duties of Members—It shall be the duty of all members of this association and they hereby agree to sell and market their products through the agency of or by the means provided and directed, or by the agency or agents selected and employed by this association only, and the members shall not be at liberty to sell, market or consign any products through or by any other means than such as are directed and provided or selected and employed by this association; provided, however, that any member may withdraw from the association for any one year after 1914 by giving written notice to the secretary during the month of April of such year of his intention so to do.

In case any member of this association does otherwise sell, market or consign his products, he shall immediately forfeit his membership in this association, and all rights hereunder and all his right, title and interest in and to the property of the association.

The growers shall have the right on obtaining the approval and consent of the board of directors in cases where small quantities of products or products not in condition to be properly handled through the association, can be disposed of to local trade to better advantage, to make such disposition of their products without incurring the forfeiture herein provided for.

Article IX.

Withdrawal from Membership—Any member may withdraw from membership in this association after the year 1914, by giving written notice to the secretary during the month of April of any year of his intention so to do, and immediately upon receipt of such notice the board of directors shall proceed to determine the value of the interest of such member in and to the property of the association.

In case the said member is dissatisfied with the award made by the board

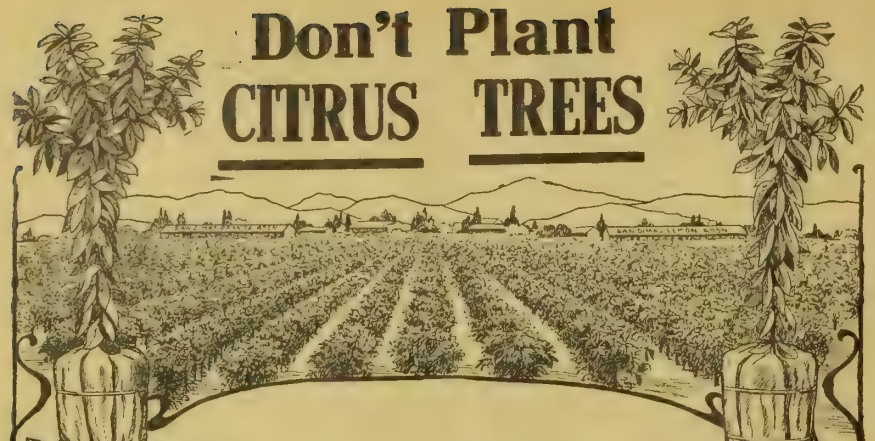
Don't Plant CITRUS TREES



until you can meet the five essential requirements of success. Here they are: **Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.**

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order NOW for Spring delivery. You will perhaps never have another chance to buy QUALITY TREES at so reasonable a price. Even the so-called CHEAP TREES which might better be called EXPENSIVE TREES by the man who expects to receive an adequate return on his investment) are quoted the same or very little less.

We were founded twenty-five years ago, and have been improving the grade ever since. Buy TEAGUE QUALITY TREES, embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the terms, but true to the best type of the varieties to which they belong as well.

Write today for prices and particulars. No orders too large or too small to fill. All correspondence promptly answered.

Our booklet "CITRUS CULTURE" sent to any address on receipt of 25c.

Citrus and Tropical Fruits

SELLING CITRUS FRUITS

THE present conditions in Europe have produced a vast army of prophets in America. The prophecies as to results to this country of war in Europe are of intense interest—to each prophet making them. But as one newspaper has expressed it, "Prophesying is a profession that requires nearly a thousand years of steady application—to get one into reliable touch with the designs of the Almighty."

The citrus marketing situation exhibits a condition which induces a horde of prophets to tell us what would result if existing marketing methods were only upset and some other scheme put into action.

One would sell direct to the consumer, another to the retail trade, another would establish a chain of stores and sell both to consumer and retailer. One would sell only on the "good" old f. o. b. plan or at auction or at this or at that other place.

All of this will lead to some good, providing folks just keep their heads and quietly think over these plans and prevent the "interests" and some of our well meaning orange growers —who are generally the newer comers to the state—from creating a flurry and a demand for unsound methods.

But a condition and not a theory confronts us, and not only the orange grower of California but the orange grower of Florida, of Spain, of Italy and of Asia Minor. The apple grower of the Northwest, the melon producer of Imperial Valley and the fruit and other producers the world over are facing ruin.

Florida growers are proceeding to destroy or at least weaken their great cooperative organization, for note:

"Jacksonville, Fla., April 16.—The citrus fruit growers at Leesburg and vicinity have withdrawn their membership from the Highland Citrus sub-exchange of the Florida Citrus Exchange and have formed an organization which will be known as the Lake County Growers' Association.

"For some time past reports have been circulated that the Leesburg association and some other associations, particularly those on the East Coast, were not satisfied with the way their fruit had been marketed or the prices received, but the Leesburg Exchange members are the first to take the initial step and withdraw."

We take it this means that the fruit of its members will now compete with that of the members of the exchange. That surely will not guarantee greater profit.

"Again: "Spokane, Wash., April 11. —The North Pacific Fruit Distributors, a marketing agency for many of the fruit growing districts in Idaho, Washington, Montana and Oregon, with headquarters here, announced last night that because of the past bad season and the withdrawal of the Hood River district, it had been reorganized.

"Expenses have been reduced by the abolishment of the publicity department, a reduction in the auditing and clerical forces, the closing of the New York and Chicago offices, the resignation of the traffic manager and the voluntary decrease of the salary of the general manager to $1500."

Cutting out publicity and being content with less efficient management means lower initial expenditure, but will it mean increased profits?

The manager of the Northwest Exchange finds that apple averages the past four years have been in excess of $1.00 per box to the grower and suggests that:

"The orchardist must take the excess above $1 a box in the good years and create a sinking fund wherewith to finance himself in the lean years."

It appears that the California grower is keeping his head rather better than the average. However he's thinking a lot and talking some. At a recent meeting at Covina C. C. Chapman is reported in the Covina Argus to have said:

"The revision of the tariff in general throughout the United States has contributed to the financial depression." He made a very strong point concerning the large amount of shipments of frosted fruit following the freeze of 1912. This, he said, had been a great factor in demoralizing the California fruit market. The market was recovering slowly from this blow because the California fruit had been in the finest condition during the last two years, but the effects of dumping great amounts of frozen fruit into the Eastern markets would continue to be felt for a number of years."

He further said, "Florida ships as many cars of fruit into the market as does California. Florida is now an equal competitor in amount, with a shorter haul. The buying power of the people of the United States and Canada is at a low ebb. This does, of course, affect the price of citrus fruits as well as the price of all kinds of products from the soil. Potatoes are selling for from 35 cents to 50 cents the bushel in New York, Boston and other points. The citrus industry is not in the best condition of any of the businesses of the world, nor is it in the worst condition.

"At a critical time in the orange shipping this year an enormous amount of decay began to show up in the orchards. This was soon the case in the Eastern markets. Cars began to arrive with 5, 10, 15 and even 20 per cent decay. This was during and after the heavy rains. Many shippers saw that the fruit was bad and made the mistake of deciding not to ice it, but to send it cheaply under ventilation. Many cars arrived in horrible condition.

"The population of the United States has only increased 20 per cent in the last ten years, while the increase in the output of oranges was from 100 to 200 per cent." The speaker drew a significant picture of this fact, showing the ever-growing problem of marketing the increasing amount of oranges. "In California," he said, "there are 21,000 acres of Valencias less than four years old and therefore non-bearing; 20,000 acres of lemons less than four years old; 42,000 acres of navel oranges less than four years old." He quoted these

figures to show what will confront the industry in a few years.

"Out of two million boxes of oranges raised in Jaffa this year," Mr. Chapman said, "the growers have only been able to market 75,000 boxes on account of the great world-war. The people are in terrible distress. Spain is losing between two and three million cases of oranges, the case being larger than the California box."

Mr. Chapman's conclusion was to the effect that "the grower in California must either have tariff protection or he must spend less money for the growing, packing and marketing. He said that if the California grower will be asked to compete on an equal basis with foreign fruit, as will be the case after the war, he must pay less for labor, less for packing and shipping, and all his cultural work must be brought down to a point where he can successfully compete with cheap foreign costs."

Many other addresses were made, many opposed to present methods of the exchange. "Sell in California," or the old f. o. b. plan, is the most popular. It sounds good to the new comer. The old timer says, "No." The editor of the Cultivator was at one time manager of one of the local associations of the California Fruit Growers' Exchange. That was more than a score of years ago and he still recalls the heartache which was caused by some of those f. o. b. sales which were so popular then. Every slump of the market called for rejection because of claimed inferiority or decay. After rejection the dealer would turn around and buy at his own figure. On this point we quote from Mr. Matthews of the Argus in an article under title of "Lest We Forget:"

"Those of our growers who, like the writer, have lived in this valley for the past 20 and 25 years, can remember when at certain seasons of the year buyers in this valley for oranges f. o. b. California were as plentiful as blackbirds; that our livery barns were taxed to their utmost capacity to provide rigs for these enterprising gentlemen who were in the field from early in the morning to late in the evening trying to convince the grower that their firm was the only one to which they should sell their fruit f. o. b. California. After all the orchards in the valley had been contracted these gentlemen disappeared until the shipping season arrived. Then it was the same old story. With strong markets and prices ruling high in the East, the fruit was moved rapidly and the shipper reaped the handsome profit. On the other hand, with a weak and declining market, the buyer would find one excuse after another why the fruit should not be picked, and in many cases the grower would lose two-thirds of his crop by drop, the shipper would make a profit on the remnant, and the grower would pocket his loss on the whole."

The Cultivator believes that all the disaster which has come to citrus growers from the two cold years, from free trade, from war and financial depression would not equal that which will come if their great cooperative organization is seriously weakened.

It won't be, for the citrus grower looks farther than today's penny.

NEW CITRUS ORGANIZATION

Regarding a new organization of citrus shippers we note the following in the Packer:

There is now in the process of organization a body of growers and shippers, whose object is to arrive at some plan for the benefit of the citrus industry. Its ultimate purpose is to make a change in the present marketing system for the benefit of the industry at large. The president elected is Kenneth MacRae, a grower at Rialto, who has been known for many years as an auction man, in fact is popularly called the "father of the auction" in Los Angeles. The vice-president elected is Fred Boruff, a large olive and lemon grower in San Fernando; treasurer, Dr. Putnam from Riverside; secretary, E. H. Eskew, assistant sales manager for the Randolph Fruit Company.

No name has as yet been chosen for the organization. A committee was appointed on organization and another committee on membership. It costs $1 to join. It is said that it is to be an independent growers' organization, although up to the present time a number of independent shippers are interested in the matter.

PLANTERS Now is the time for you to Order Nursery Stock- Buy the Best

Citrus Trees and Olives

"R. & W." Trees are always cheapest in the long run

OUR SPLENDID STOCK OF ORANGES, LEMONS, POMELOS AND OLIVES—in all the leading varieties, should be investigated before placing your order. It makes no difference how few or how many trees you may wish to buy, we can supply you with the choicest quality stock and at prices that will certainly prove tempting.

ASK FOR OUR "BULLETIN ON THE OLIVE," GIVING VALUABLE INFORMATION that should be in the hands of every planter. We specialize on the growing of fine olive trees and have an exceptionally choice assortment of Mission, Manzanillo and other varieties. Olives are coming into their own and if you contemplate planting, it is particularly necessary that you should plant the varieties which are going to prove the most profitable at the time your trees come into bearing.

"ROEDING'S PRACTICAL PLANTERS' GUIDE" —— SENT FREE

This book is the result of Mr. George C. Roeding's more than 30 years' experience in California horticulture. It tells how and when and what to plant. Also gives detailed information illustrated with photographs on PRUNING. Contains 11 pages of valuable data on citrus fruits and olives.
If you intend planting send us your list for prices and suggestions and we will send you a copy free—otherwise the price is 25c. Write us to-day.

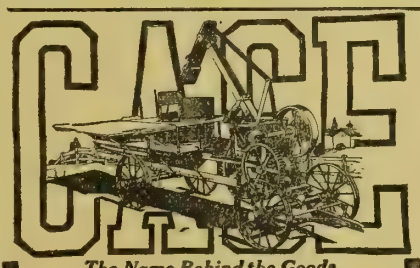
CASE



The Name Behind the Goods

Baling Presses

Different from the Others

CASE Steel Belt Power Baling Presses are built in two sizes—14 x 18 inches and 17 x 22 inches, capacity of 3½ to 5 and 4 to 6 tons per hour. Require only 6 to 10 Brake horsepower to operate.

Just to illustrate how they are built, remember this—the boxes of all gears are carried on a single casting. No chance then for gears to get out of line. Do you want to know more about the details of their construction? They are built like all CASE machinery, to do the best work in the shortest time at the least cost—*and they do it.*

The safest hay baler to operate. You can't choke it. Every bale compact and smooth. Operates with 2 less men when CASE Hay Fork is attached.

CASE Sweep Power Baler

Just right for home use. 3 men and 2 horses will bale from 1½ to 2½ tons per hour. Automatic feed. Bales 60% faster than any hand-fed machine. Strongly built. 72-inch tying chamber, walls cannot bulge. Send for catalog and prices.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

Redlands & Yucaipa Land Co.

Deciduous Fruits

CROP ESTIMATES

IT is apparent there will not be a 100 per cent crop, especially as to apricots, which it appears are running generally under normal. Likewise prunes will be light; peaches will perhaps be nearly normal, though certain sections report serious inroads by the blight. Our guess would be the apricot crop would run between 60 and 70 per cent of normal.

John Tuohy, Tulare, Tulare Co.

So far as I have observed or been informed the outlook for a new crop of apricots and peaches in this vicinity is fully up to the average. No damage from frost so far and none now expected.

The orange crop is very promising. Growers are cooperating in the handling and marketing of that crop in a very businesslike way.

D. C. Funk, Upland, San Bernardino County

The apricot crop in this vicinity will be good. Trees blossomed heavily; the weather was very favorable and the fruit set well, so we have promise of a big crop of fine quality.

Peaches also look well and give promise of a big crop.

J. P. Dargitz, Sacramento, Sacramento County

I am so out of touch with the fruit business now that I fear my guess would not be very reliable; in fact, would be too much like guessing that has been done in the past.

The weather and moisture conditions have been all that could be desired by the grower to get big crops. However, both apricots and peaches have a habit of dropping and blasting the growers hopes, though peaches not so much as prunes or apricots. It is early, but the outlook is generally excellent to date.

Sheridan W. Baker, Santa Rosa, Sonoma County

Replying to your inquiry as to the apricot and peach crops in this section it is safe to say that the prospects are good. We grow comparatively few apricots.

The prune crop is harder to estimate and present reports are to the effect that it will be a half crop at least.

A. Hancock, Bakersfield, Kern County

The prospects for the apricot crop in Kern County at this date are only fair. Two-thirds of a normal crop, or about one-half of last year's crop (which was a record-breaker), would be about right, I think. The early and late varieties are very light, but the medium varieties are fair.

Peaches also have a tendency to be light; some varieties are better than others, but none will be up to normal.

In fact, the prospects for nearly all kinds of fruit here appear to be below normal or full crop, but probably will be better grade on that account.

Winters Dried Fruit Company, Winters, Yolo County

The conditions for making crops have been all that one could wish for, having plenty of rains at the right time, a warm spring, farm operations brought up to standard. Shot-hole fungus on apricots is bad, the canker worm also on apricots. and prunes. Still we have a prospect that will show up a greater tonnage than in years past.

Apricots, 100 per cent; peaches (all varieties), 100 per cent; almonds (all varieties), 80 per cent; prunes, 75 per cent.

Harry Lee, Secretary Orange County Dried Fruit Association, Santa Ana.

The apricot crop will be 70 per cent of last season's crop, or 70 per cent of a full crop.

Very few peaches in this district.

Ventura County Dried Fruit Association, Santa Paula

Ventura County apricot crop estimated at 50 per cent of last year.

N. E. Mathews, Santa Ana, Orange County

Concerning apricots, I have cut all mine out, due to unsatisfactory market conditions. Many others in this section have done the same. Many have nearly all their crop of last season yet. The prospect for coming crop yield is good.

Peaches only fair as far as I can learn, as they have never proved profitable in large quantities here. There are not many orchards in the section.

D. Felsenthal, Fillmore, Ventura County

Apricots in Ventura County are spotted, as near as I can learn, ranging from 20 per cent in some localities to 80 per cent in others, with an average of from 55 to 60 per cent of last year's crop.

Chamber of Commerce, Paso Robles, San Luis Obispo County

Apricots have set well and give promise at this time of a good yield. The showers have helped to bring them along and to hold off the frost. Have had no frost this month. Same is true of all crops—peaches, pears and almonds.

Grain in most all sections promises very well and feed is good. In fact, just at this time the entire crop prospect is for above an average yield.

W. L. Whepley, Lemon Cove, Tulare County

Lemon Cove has prospects of the largest crop of oranges ever harvested this year. The bloom was very early and immense, and is setting nicely.

S. O. Walker, Secretary California Cured Fruit Exchange, San Francisco.

To gain as definite information as possible is ever our effort, and we probably fail in accomplishing our desire nearly as often as others do, especially early in the season, and an estimate of probable production, to have any value whatever, should be state-wide. In some districts in the state we are compelled to rely largely upon reports made by those who are not members of this organization, and therefore we have to accept the same at their face value or disregard them wholly. This brings us to say to you that we believe the 1915 crop year will produce a total from 25 to 40 per cent. less than the production of the 1914 crop year. Having said this, it is also proper to say that there are a portion of our own people who insist that they will not have this year 25 per cent of last year's tonnage of cots.

With regard to the prune situation, reports from different localities are so widely divergent, and yet evidently honest, that we believe that notwithstanding the opinion of others to the contrary this year's total will not very greatly, if at all, exceed the 1914 crop.

Sebastopol Apple Growers' Union, Sonoma County.

No apricots are raised in this section and very few peaches.

The cherry crop was more or less damaged by rain at blossom time and will probably turn out about 20 per cent of a normal yield.

Prunes are estimated at one-half and apples indicate a full yield.

M. Sharpe, Vacaville, Solano County.

Apricots, 100 per cent. Some shot hole fungus owing to late rain and inability to spray owing to wet ground.

Pears, about 20 per cent owing to thrips.

Prunes, about 50 per cent.

Plums, about 90 per cent.

Cherries, about 30 per cent. Late rains washed the pollen.

Grapes, about 100 per cent to date.

Peaches, about 100 per cent.

Other fruits not grown commercially here.

LIGHT APPLE TONNAGE THIS YEAR

A dispatch from North Yakima says: "With the blossoming period for soft fruits practically over and that of apples well along, reasonably accurate estimates of the 1915 fruit tonnage is possible. Field managers for the larger organizations and fruit dealers who have been touring the valley agree that the apple tonnage will not exceed 70 per cent of that of 1914 and probably not be more than 60 per cent. Some put it as low as 50 per cent, as the older trees, which bore heavily last year, are nearly all idle this year.

"In the Zillah district, one of the heaviest shippers and where old trees predominate, there will not be more than one-third of the apple tonnage of last year. Cherries and pears are exceptionally heavy and cherries are setting well. Some peaches are light, but it is believed the tonnage will be as great as a year ago. There have been no frost injuries this spring.

LITTLE LEAF

"This disease of "little leaf" attacks many different kinds of trees, occurring to a very wide and serious extent in the San Joaquin Valley. Especially on peaches it is the cause of very severe loss. Two very common ideas have been in existence, namely, that the disease is due to gall-forming nematodes upon the roots or that it is the effect of crown gall. Extensive examinations by the University of California experiment station have shown that while both of those conditions are common in trees or orchards affected with little leaf, still there are many cases where little leaf is not accompanied by either of these troubles. Therefore it must be due primarily to some other condition.

"Two facts have been found very pronounced as to the occurrence of this disease, namely, that affected trees are usually located either in streaks of sandy or very light soil running through the orchard, or that they are planted in places where corrals or barnyards were formerly located. The latter condition is very common and striking in the San Joaquin Valley. In the investigations thus far conducted little leaf is always accompanied by a lack of available nitrogen in the soil. This may be due to a lack of total nitrogen, or, as in the case of the corrals, to a lack of nitrifying power in the soil.—University of California Agricultural Experiment Station.

ALTITUDE STERILIZATION TABLE FOR USE IN CANNING.

Bases on 29-inch barometer with temperature at 70 degrees Fahrenheit at sea level.

Note—Add time in third column to the process times given in directions if you are above sea level. Determine how high, then consult table.

Altitude	Water boils at	Additional time
512 feet	211 degrees	2 minutes
1025 feet	210 degrees	4 minutes
1539 feet	209 degrees	6 minutes
2063 feet	208 degrees	8 minutes
2589 feet	207 degrees	10 minutes
3115 feet	206 degrees	12 minutes
3642 feet	205 degrees	14 minutes
4169 feet	204 degrees	16 minutes
4697 feet	203 degrees	18 minutes
5225 feet	202 degrees	20 minutes
5674 feet	201 degrees	22 minutes
6304 feet	200 degrees	24 minutes

CALIFORNIA CANNING SEASON

Approximate period of packing the different varieties.

Fruits

Apricots, latter part of June to middle of August.

Blackberries, latter part of June to fore part of September.

Cherries, latter part of May to middle of July.

Currants, last three weeks of June.

Gooseberries, latter part of May to latter part of June.

Grapes, fore part of September to end of October.

Nectarines, latter part of July to fore part of September.

Pears, latter part of July to latter part of September.

Peaches, Free, latter part of July to middle of October.

Peaches, L. C., latter part of July to middle of October.

Peaches, W. C., middle of August to middle of October.

Plums, Green Gage, middle of July to middle of September.

Plums, Egg, middle of July to middle of September.

Plums, Golden Drop, fore part of August to fore part of September.

Plums, Damson, latter part of August to latter part of October.

Quinces, middle of September to middle of November.

Strawberries, fore part of May to latter part of October.

Vegetables

Asparagus, latter part of March to middle of June.

String Beans, middle of June to end of November.

Peas, middle of May to latter part of June.

Tomatoes, latter part of August to latter part of November.

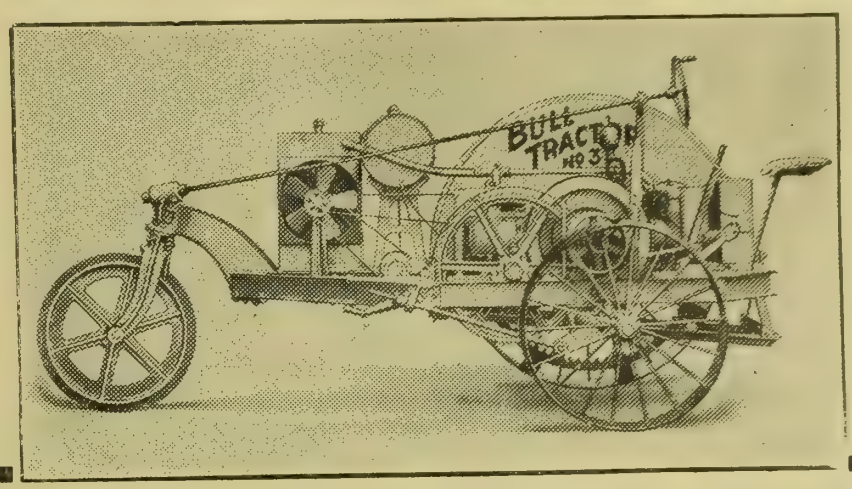
New Big Bull TRACTOR

"A Giant in Power, a Midget in Cost"



Makes Horses Too Expensive to Buy and Keep

THIS NEW BIG BROTHER OF THE FAMOUS "LITTLE BULL," which took the farmers of this country by storm last year, develops from 7 to 10 horsepower at the draw bar (where you get the pull), and from 20 to 25 horsepower at the belt (for stationary work). The **New Big Bull Tractor** is the "big tractor buy of the year." There are several thousand now in use (more than most other makes combined) and all **GIVING SATISFACTION.**

TEN REASONS

Why You Should Buy the New BIG BULL TRACTOR

1—It can be depended upon and DELIVERS THE GOODS.
2—It will do more all-round farm work than any other tractor anywhere near its cost. Look at the following features:
3—The Bull wheel runs in the furrow and does not pack the land. This principle covered by patent.
4—The patent STEER WHEEL also running in the furrow in line with the bull wheel, makes the tractor positively and automatically self-steering.
5—Patent leveling device, by which the tractor is quickly and easily adjusted to side hills or deep furrows.
6—Direct drive with only four gears. All complicated transmission and compensating gears absolutely eliminated.
7—Special gear shifting device.
8—Electric welded gasoline tank and brass tube radiator.
9—Extra large crank shaft and connecting rod bearings.
10—Extra large inspection plate on top of motor, affording easy examination of bearings, without disturbing timing.

Send for specifications today. You can own and use this machine at a BIG PROFIT. Get the facts.

Our first big shipment of the **New Big Bull Tractor** arrived here last week and we are filling our early orders from it. Another big consignment is headed this way. Is your tractor in this shipment?

PRACTICAL DEMONSTRATION

Come and see it or fill out the coupon and mail it today, and we will send you ALL YOU WANT TO KNOW. Get TRACTOR WISE. Buy where thousands of sales keep the margin of profit down within reason.

Let us show you how you can make big money by owning a good tractor, but MORE MONEY by owning a New Big BULL TRACTOR.

THE SCHMEISER PORTABLE AUTOMATIC DERRICK

THE
HAY STACKER THAT SAVES
TIME, WORK AND MONEY

This derrick will handle hay, loose or baled, in the easiest, quickest and most economical manner known. It is always ready, is portable and can be moved from place to place as easily as a farm wagon. With it three men can do the same amount of work as nine men by hand. Has great lifting capacity and is unequalled for hoisting machinery, timbers, or heavy loads of any kind.

WRITE US TODAY and we will send you descriptive and illustrated literature. The Schmeiser Portable Automatic Derrick is not an experiment. It is the result of 25 years of actual experience gained in farming. It is being used with great success all over the Pacific Coast. Write us NOW for full details explaining just what it can do and how it can save you time, work and money. Address

CONSTITUTION AND BY-LAWS

(Continued from Page 507)

of directors the value of the interest of such member shall be determined by appraisement by three disinterested persons but in no case shall the value of such interest exceed the amount actually paid to the association by such member.

In case of the death of any member the value of the interest of such deceased member in and to the property of the association shall be determined as above specified and paid to the legal representative of such deceased member. Provided, however, if said legal representative desires to succeed to the membership of such deceased member he may with the consent of the board of directors do so.

In case of a bona fide sale or destruction or loss of the property of any member served by this association, or the occurrence of any other act which shall have the effect of permanently removing such member from the privileges of this association, the value of the interest of such member shall be determined as herein specified and paid to such member, and all the rights, privileges and interests of such member in the association shall thereupon cease.

All amounts to be paid under this article upon the termination of any membership shall be paid by the board of directors as soon as such membership shall be taken by some other party, and as soon as the association has sufficient funds on hand with which to pay said amount.

Article X.

Expulsion of Members—Any member of this association may be expelled from the association by the board of directors for any cause or conduct which the board of directors shall determine by a two-thirds (2-3) vote to be injurious to the association.

In case of the expulsion of any member the value of the interest of such member in the property of the association shall be determined as specified in the last foregoing article, and shall be paid to such member within 40 days thereafter, and upon the payment of such amount to such expelled member all the interest of such member in and to the property of the association shall be terminated and all the rights and privileges of such member in the association shall cease.

Article XI.

Division of Profits—Each variety of products shall be graded according to quality, and each member shall receive credit for the number of pounds delivered of each grade that may be established, and receive pay for the same on the basis of what that grade has actually sold for in the market, less the expense of marketing the same. The net proceeds of sales of products shall be distributed pro rata from time to time as fast as the returns become available.

Article XII.

Funds—The funds of the association shall be paid to the treasurer and his receipt taken for same, and shall only be paid out on check signed by the president or vice-president, and countersigned by the secretary, or by the manager when authorized by the board of directors.

Article XIII.

Books, Etc.—Proper books of entry shall be kept, showing all receipts and disbursements of monies, the amount of fruit delivered to the association by each member, and the variety and the grade thereof. The books and correspondence of the association shall be in the name of the association, and each member shall have access to said books and correspondence during business hours. A suitable office shall be secured in which the books and papers of the association shall be kept; such office shall be the headquarters of the association.

Article XIV.

Amendments—The by-laws may be amended or altered by a two-thirds (2-3) vote of the members at the annual meeting or at a special meeting called for that purpose.

Know All Men By These Presents: That we, the undersigned, directors and secretary of the Tulare County Growers' Association, do hereby certify that the above and foregoing by-laws were duly adopted as the by-laws of said association on the —— day of March, 1914, and that the same now constitute the by-laws of said association.

THE CANNERY IN THE HOME

YEARS ago the home used to be the center of industry. The family operated its own little factory and attended to its own distribution and the day of the prosperous middleman prevailed.

Then the installation of modern labor-saving machinery, operating on a large scale, took the business away from the small plant and consolidated it under larger systems. The result was hardship and poverty for the masses with all the profits going into the hands of the few gigantic operators.

People began to ask for a revision of the old standard under methods which are perfectly modern. The back to the soil movement was the first sign of this demand.

With people back on the soil the marketing question came up more strongly than ever. People on the land demanded the maximum returns for their efforts.

Especially has this proven true in the case of canning and packing establishments. The family which sells all its fruits, berries, vegetables, meats, etc., to the large cannery does not make a glowing profit. People coming to realize the profits in the canning and marketing business, began to demand their share of the profits.

"Why can't we have a cannery of our own at home?" became the question.

To answer this demand there are now on the market many ideal home canning outfits. These are really canneries of the regulation standard but adapted to the home where they can be installed on a small scale and enlarged as the business warrants it. Thus every family is in position to start its manufacturing business in a small way, canning all it produces, getting the top market prices for its products, and gradually, according to its own ability, grow as large as it desires.

Many of the best canning firms today began in this way only a few years ago. While this system is comparatively new and the practical small home cannery is really an innovation, the results have already been such that today thousands of families are

Touring—
Out of Oil

—a change from the oil you have been using means bother in adjusting the feed. Otherwise too much or too little is fed into the cylinders. No trouble if you use

ZEROLENE
the Standard Oil for Motor Cars

It is *obtainable everywhere*, from Seattle to San Diego, from Spokane to Phoenix—at city garage or roadside hamlet.

And it is always uniform—the same body—the same perfect lubricating quality.

Dealers everywhere, or at all agencies and Service Stations of the

Standard Oil Company
(California)
Los Angeles

realizing the immense possibilities of having their own cannery at home.

The marketing question for the farm which operates its own small cannery is a very simple one. There is always a good demand in the nearby towns and cities for the better grade of home canned fruits, vegetables, meats, etc. Of course, quality counts, as in everything else, but poor quality is its own fault, the fault of carelessness and lack of proper attention, while good quality is the sure road to success and more money for the farm home.

When a family puts up a good grade of canned foods, which may be put up in glass jars with equal facility, the reputation of the brand soon spreads and there is no limit to the amount which can be sold.

A great advantage of the small cannery on the home farm is that it gives profitable occupation to everyone on the place, young and old. Fruits and vegetables must be prepared for canning or packing in glass, and the sterilizing must be done. Then there is the labeling and crating—thus giving everyone something to do which is profitable.

It is a well known fact that the canneries of the Pacific Coast have made hundreds of thousands, yes, millions of dollars during the past few years. Gradually much of this profit is being diverted direct to the home through the medium of the home cannery. But the demand for good canned food is so huge that instead of being competitors the canneries operating on a large scale and the canneries on the farm today and those that are being planned for this and coming years can operate with perfect friendliness. There is room for all, for the market is the whole world. Packed in glass and in tin, Pacific Coast fruit, vegetables and meat, can go to the remotest corners of the world and bring top prices for the growers.

The home cannery is without doubt the greatest invention of modern science contributing to the wealth of the farmer, the gardener and the orchardist.

A FEW NOTES ON THE COST OF CANNING

Written for California Cultivator
By W. V. Cruess

A SMALL cannery designed for handling peaches and tomatoes would need the following equipment at least, if the plant is to operate on a commercial scale: Cutting table, lye peeler, washing tank for peeled peaches, blancher for peeled peaches, sorting belt for peaches, grader for peaches, canning table, syruper, exhaust box, sanitary capping machine, cooking or sterilizing machine, scalder for peeling tomatoes, peeling and filling table for tomatoes, pulp machine for tomato pulp, motor or steam power with connections to drive machinery, and steam boiler for cookers. The necessary buildings should contain a receiving and storage room for fresh fruit, an office, scale room and wagon scales, canning room, cooking room, boiler room and warehouse room. The machinery including boilers for cooking and power will cost $6000-$8000 according to a large cannery supply company of California. The buildings would be extra. Probably $12,000 would not be any too much capital to equip and build such a plant. Its capacity would be at least 500 cases of two dozen cans each per 12 hours.

This would be 12,000 cans or approximately 13 tons of peaches daily. For a season of 50 days on peaches this would be over 600 tons of fruit. For a cannery devoted to peaches and tomatoes only the peach crop would have to be cleaned up before starting on the tomato crop because the machinery can not be used conveniently for both.

Allowing 12,000 cans of tomatoes daily or approximately 17 tons daily for a 50-day season the plant would turn out 850 tons of tomatoes.

Or there would be canned a total tonnage of peaches and tomatoes together of 1450 tons. This is figuring on a 12-hour day and a yield of 40 cases of peaches and 30 cases of tomatoes per ton on a basis of number 2½ cans. Two dozen cans per case.

The capital necessary to operate such a plant may be approximated from the following figures: A ton of peaches will cost on the average $20, tomatoes will cost $6.00-$8.00 per ton. The total cost of grading, peeling, syruping, canning, labeling, etc., of the peaches will amount to approximately $60 per ton for peaches according to figures given by Mr. Campbell of the Tulare County Growers' Association. At $20 for the fresh fruit this brings the total cost to about $80 per ton f. o. b. cars at factory. Tomatoes can be canned more cheaply than peaches because no sugar is used in the cans and the labor cost is less.

The profit on peaches when sold at $1.20 per dozen and 7 per cent discount will be approximately $10. According to a cannery supply firm consulted concerning profits in tomato canning, the profit was placed at 50 per cent of cost of fresh tomatoes. This would be a profit of $3.00-$4.00 per ton.

Thus if the cannery be of the cooperative type, producing all its own fruit, it could pay the owners $30 per ton for peaches and $9.00-$12.00 for tomatoes. This would be net after paying all operating costs and interest, but does not take care of sinking fund.

The wastes in marketing can be seen when it is known that the farmer's ton of fruit which he sells for $20 costs the housewife in the East $288. The marketing side of canning will be more difficult for the new cannery to solve than its technical problems.

Cans used for peaches and tomatoes can be made at the factory, but the necessary machinery costs about $12,000. Unless very large quantities are to be used it will therefore be better for the cannery to buy its cans ready made at $18-$20 per 1000.

There are a number of home canning outfits on the market.

The objections to the small outfit for commercial purposes are the necessity for use of solder cans rather than the sanitary cans, the non-uniformity of product, the very large amount of hand labor and difficulty in disposing of small lots of fruit or vegetables that can not be taken by the local market. However, several moderate sized home canneries might combine their output and market cooperatively with greater success than if each acted independently.

If possible, the cannery either large or small should produce not only peaches and tomatoes but should also be able to supply other fruits and vegetables as well. The more complete the line the better, because the buyer would naturally prefer dealing with one firm in preference to half a dozen to obtain a corresponding number of different canned products.

In business watch your competitors. No one man or concern has a monopoly of all the best brains and methods. Let competition be an incentive to your energy and ambition. Give the other fellow a fair square deal and beat him out on your merits.—Walter H. Cottingham.

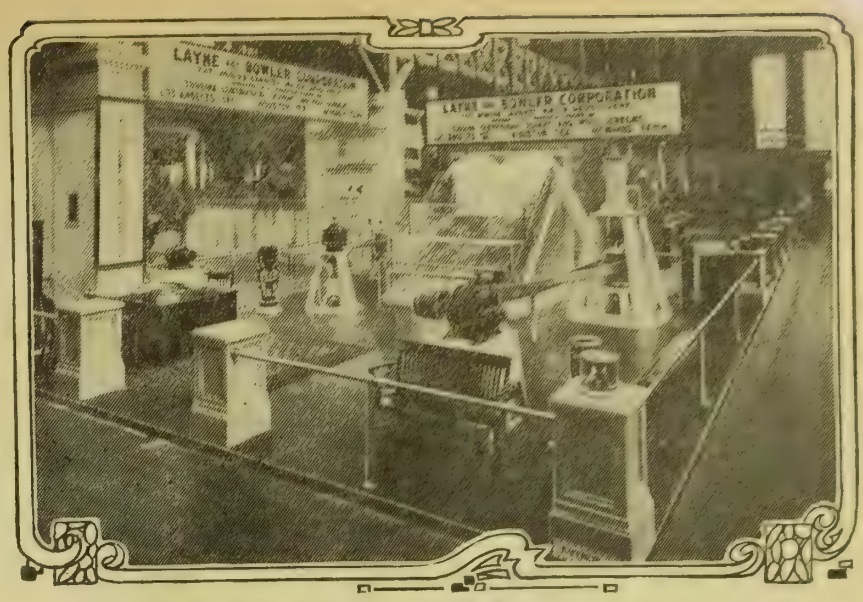

Exhibit of Pumps at San Francisco Exposition

Visited by hundreds of prospective irrigators. One of the most interesting and complete exhibits of irrigation pumps ever assembled is that of the Layne & Bowler Corporation in the Palace of Machinery at the San Francisco Exposition.

In this exhibit are the turbine centrifugal pump for shallow and medium work, belt driven; one driven by direct connected vertical motor, and one for extraordinary depth where the weight of the shaft is carried on an oil thrust bearing.

They are all in actual operation and prospective irrigators and pump users are availing themselves of the opportunity of seeing the exhibit. The different styles of well screens and steel casings are also shown.

One of the best pump men on the Coast has been chosen by the manufacturers to superintend the exhibit and answer questions visitors may ask.

To those who are unable to attend the exposition, the Layne & Bowler Corporation, 900 Santa Fe Avenue, Los Angeles, manufacturers of the world famous Layne & Bowler Pump, will gladly send their pump and irrigation booklet, No. 30. It gives valuable irrigation information and will be sent free of charge and postpaid.

Orchard Brand Spray Materials

ATOMIC SULPHUR paste, for the control of mildew, miscellaneous fungus troubles, red spiders and mites on fruit trees, grape vines and other plants. It may be effectively combined with arsenate of lead, oil sprays and nicotine solutions when spraying for other troubles without causing any injury where the separate ingredients used alone would be safe. Effective as a carrier and spreading agent for nicotine solutions and arsenical poisons.

LIME SULPHUR SOLUTION, a high grade, concentrated, clear liquid, free from sediment, for spraying citrus trees and for dormant spraying on deciduous fruit trees.

BORDEAUX MIXTURE paste, a concentrated, efficient fungicide ready for use by diluting direct in spray tank.

ARSENATE OF LEAD paste and powder, for the control of codling moth and other chewing insects.

MISCIBLE OILS, OIL EMULSION, LIQUID WHALE OIL SOAP, etc., for the control of aphis and other sucking insects.

In dealing with this Company, fruit growers obtain advantage of quick delivery, fresh materials, minimum freight rates, prompt service, uniform prices and definite directions for the intelligent use of these materials in order to obtain the best possible results.

Bulletin No. 5 gives the latest and best available information for the efficient and economical control of insect and fungous troubles and will be mailed free of charge to any fruit grower, on application.

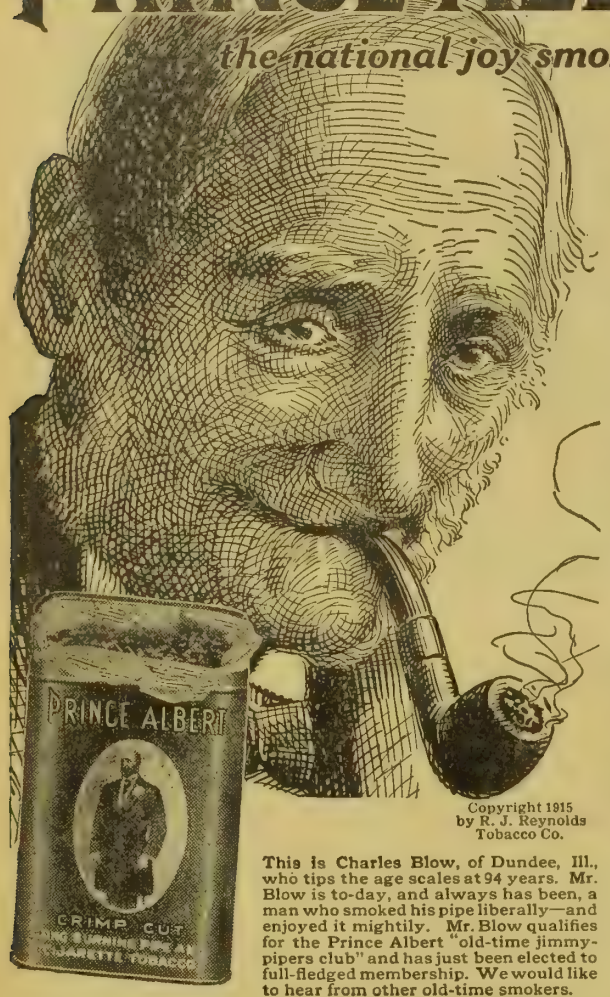
PRINCE ALBERT

the national joy smoke



Copyright 1915 by R. J. Reynolds Tobacco Co.

This is Charles Blow, of Dundee, Ill., who tips the age scales at 94 years. Mr. Blow is to-day, and always has been, a man who smoked his pipe liberally—and enjoyed it mightily. Mr. Blow qualifies for the Prince Albert "old-time jimmy-pipers club" and has just been elected to full-fledged membership. We would like to hear from other old-time smokers.

has this to say to you:

You get busy and smoke some pipe, or roll a makin's cigarette with Prince Albert tobacco that'll make you wish you could hark back to your first days of smoking.

Because, no matter how pipe-shy any man is, no matter how tender his tongue, *he can* smoke a pipe, and *he will* smoke a pipe if he smokes Prince Albert tobacco!

Why, smoking P. A. is like having breakfast in bed Sunday morning! You just pack that joy'us jimmy pipe with load after load. The first few puffs *prove* P. A. can't bite your tongue or parch your throat. That's because it is made by a patented process owned exclusively by the R. J. Reynolds Tobacco Co. *No other tobacco can be like Prince Albert.*

Prince Albert is sold everywhere. Just say, "P. A. for mine." In the toppy red bags, 5c; tidy red tins, 10c; pound and half-pound tin humidors; crystal-glass pound humidors.

CANNING RECIPES

THE recipes given below are from a 60-page book issued by the Henninger & Ayes Manufacturing Company, Portland, Oregon. The book is filled with information of value to home canners. In the preface the publishers say:

The readers of this book will find that the formulae or recipes given are practical, ready for use; they have all been tried and used repeatedly by men who have made a success of the canning business, and there is but one reservation that goes with them; considerable sense must be added to all formulae. By this we mean that it is absolutely impossible to give one set of time process for all conditions and locations; that every change of temperature, altitude, difference in soil or fertilizer, a wet or dry season, and a number of other causes, may have an effect upon the process; and so no large pack should be put up until a trial batch has first been made, and not only at the beginning, but frequently during the pack, in order to detect any changes.

Blanching

All green vegetables should be given a bath in running water for a sufficient length of time to make them plump and crisp. Blanching is simply the act of plunging the vegetables in a bath of boiling water, which may or may not contain salt or other chemicals. The bath must be absolutely boiling when the article is dipped, and of such a capacity that the immersion will not more than momentarily check the boil. Blanching serves to set the color of green vegetables and also removes the mucilaginous substances in which various germs find lodgment, from the surface. When chemicals are used in the blanching bath, they bleach, harden or toughen the surface according to the nature of the chemical used. The solvent power of pure water is sufficient to destroy the firmness, color and skin of many vegetables when cooked therein; this is why brine (the chemical action of salt is to harden water) is generally used to fill the cans.

The Making of Brines

In preparing brine for canned vegetables, there are but two elements to be regarded as far as the materials entering into the preparation of the brine are concerned—water and salt. Yet many canners, by neglecting to give proper attention to the selection and preparation of these materials, have nullified the results of an otherwise careful process. The water used in making brines should be soft; that is, not containing appreciable quantities of lime, and free from iron.

By dissolving the amount of salt specified in the first column of the following table in 12½ gallons of water, the percentage of salt contained in the resulting solution will approximate as follows:

½ lb. of salt in 12½ gallons of water equals ½ of 1%.

1 lb. of salt in 12½ gallons of water equals 1%.

1½ lbs. of salt in 12½ gallons of water equals 1½%.

2 lbs. of salt in 12½ gallons of water equals 2%.

3 lbs. of salt in 12½ gallons of water equals 3%.

4 lbs. of salt in 12½ gallons of water equals 4%.

5 lbs. of salt in 12½ gallons of water equals 5%.

For making brine, jacketed copper kettles, wooden tanks, with closed copper coils in bottom or wooden tanks with steam jet, may be used. In making brine, first bring the water to a violent boil, then add the sugar, salt, etc., and stir until dissolved. If material used contains any dirt, specks, chips or particles of paper, place it in a closely woven bag and suspend just below the surface of the boiling water.

Asparagus No. 1 Process

Wash free from adhering earth and give bath in cold water until crisp. Scrape off the tough outer skin and roughly assort according to diameter of stalks. Cut off butt, leaving top of right length for can. Wash thoroughly in cold water; place carefully, butts down, in a wire basket provided with a cover to keep stalks in place. Have ready a boiling hot bath containing ½ lb. salt to 12½ gallons water; immerse the grass for one-third its length and boil from three to five minutes, according to thickness of stalks, then drop so that two-thirds is covered, and cook from three to five minutes.

Then drop in cold water for the longest convenient period. Place carefully in cans and fill with cold brine (2½ lbs. salt to 12½ gallons water), solder lid and exhaust:

2 lb. cans, 8 minutes.
3 lb. cans, 10 minutes.
4 lb. cans, 12 minutes.

Tip and process:

2 lb. cans, 10 minutes at 240 degrees.
3 lb. cans, 12 minutes at 240 degrees.
4 lb. cans, 15 minutes at 240 degrees.
2 lb. cans, 40 minutes at 212 degrees.
3 lb. cans, 45 minutes at 212 degrees.
4 lb. cans, 50 minutes at 212 degrees.

Remove from process kettle and drop in cooling bath. For glass jars fill with cold brine and allow same process without exhausting.

Asparagus No. 2 Process

Wash, scrape, sort and size. Blanch two minutes in bath containing salt ½ pound, water 12½ gals. Place in side-opening cans, fill with brine (2½ lbs. salt to 12½ gals. water), solder lids and exhaust:

2 lb. cans, 8 minutes.
3 lb. cans, 10 minutes.
4 lb. cans, 12 minutes.

Tip and process:

2 lb. cans, 25 minutes at 240 degrees.
3 lb. cans, 30 minutes at 240 degrees.
4 lb. cans, 35 minutes at 240 degrees.

Drop in cooling bath. This is the time for stalks of average thickness; for small size allow three minutes less; for large, three to five minutes more.

String Beans

The smaller the beans are the finer the article they will make, because they are tender and nearly free from the tough string, from which they take their name, and which forms as the bean grows. The beans are also then of a fine color, being the rich dark green so desirable. The finest beans are picked when only about two inches long and about one-eighth of an inch thick; and for this reason, of course, a large quantity is required. From this size up, they will grade according to the time picked.

After being picked they should be brought to the factory with as little delay as possible, and care should be given that they are placed in splint baskets or slatted crates, never in bags. The reason for this, as is well known, is that when packed in bags they sweat and become tough, losing their crisp, brittle nature. If the beans become wilted, they should be placed in fresh, cold water, allowing them to stand for a time, which will largely restore their crispness.

Wash them in cold water to remove all grit and string carefully from both ends; then break or cut in pieces 1 inch or 1½ inches long. The smallest sizes are packed whole.

After properly preparing the beans, blanch two minutes in boiling water; place in cans, fill with hot 1½ per cent brine, cap, tip and process for the usual average size beans.

No. 2 cans, 40 minutes at 240 degrees, or 60 minutes at 212 degrees.

You're not afraid of new harness breaking. Well, harness that has been in service for years will stand the strain too, if you treat it occasionally with

EUREKA HARNESS OIL

That's because certain oils in Eureka are great leather preservatives. They nourish and lubricate the fibre, keep out dust, sweat and moisture, and preserve the original life, strength and elasticity of straps, tugs, breechings, etc. It pays to use it. Arrange with your harness man to dip your harness. Or apply it yourself by hand. Make your harness last longer. Dealers everywhere.

PUMP WATER Without Cost

The new Hydraulic Ram that operates in large sizes as well as small.

For fuel or power for Irrigation, Hydraulic or Placer Mining and Water Works.

The Sterling Ram is Reliable and Efficient. It levelops its own power from fall n stream or litch.

Write for catalogue. Estimates furnished.

Hill Hydraulic Machinery Co.
656 Pacific Bldg. - - Seattle, Washington

Ideal Gopher Trap

Only Trap guaranteed to catch large or small gopher. Being round with thin edges gopher walks into trap before detecting anything in runway. Positive grip, jaws always hold. 100% efficient—catches gopher every time. Easiest to set. Far safer and surer than poisons or gas. Farmers say it's worth dozen other makes. Price 50c. If your dealer can't supply you, will be sent postpaid on receipt of 60c; two traps for $1.10; six for $3.00. Money back if not satisfied.

The smaller sizes require less time, dependent upon their tenderness.

Peas

In peas we have one of the most important packs of the canning industry, it being classed among the "staple articles."

The mechanical inventions have possibly been more noted in connection with this article and of more benefit to it than in any other single article connected with the business, and they have all tended to not only increase the output, with a saving in time and labor, but to increase the quality of the goods. This is so true that it is now recognized that without these improved mechanical devices it is impossible to pack peas profitably.

Grading for size:

Petit Pois or size No. 1, sieve 18-64ths.

Extra or size No. 2, sieve 20-64ths.

Extra or size No. 3, sieve 20-64ths.

Sifted or size No. 3, sieve 22-64ths.

June or size No. 4, sieve 24-64ths.

Marrowfat or size No. 5, sieve 26-64ths.

Blanching—There are two objects in blanching peas: (1) To remove the mucous substance from the outside and a part of the green coloring matter, so as to have a clean liquor in the can; (2) to drive water into the peas so that all will be tender. In the young juicy pea, the water content is at its maximum, so that the cleaning of the surface is all that is necessary. The time required for blanching is from one-half to one minute for No. 1 and No. 2 or "petit pois" and "extra sifted;" one and a half minutes for the No. 3 or "sifted;" two minutes for No. 4 or "early June," and two and one-half minutes for No. 5 or "marrowfat."

The process times given are a fair average, but the processor should bear in mind that peas grown during a wet season will require a shorter process than those grown during a dry season; also, as a rule, the later in the season the peas are planted, the more process they require. The processor should aim to turn out a finished article that is fit for table use by simply heating through, to contain no broken or bursted peas and with a perfectly clear liquor. If cans are filled too full some of the peas will burst and produce cloudy liquor.

For filling cans use a 3 per cent brine, though by many a sweet brine (3 per cent salt, 2 per cent sugar) is considered an improvement on plain brine.

Exhaust the filled cans in steam box, bringing the temperature to as near 170 degrees as possible. Cap, tip and process No. 2 cans:

No. 1 size or Petit Pois, 15 minutes at 240 degrees.

No. 2 size or Extra Early June, 16 minutes at 240 degrees.

No. 3 size or Early June, 20 minutes at 240 degrees.

No. 4 size or Sifted June, 25 minutes at 240 degrees.

No. 5 size or sifted Garden, 28 minutes at 240 degrees.

No. 5 size or Marrowfats, 40 minutes at 240 degrees.

Sizes No. 1 and No. 2 can stand a longer process without being damaged, and there are those who advocate a reversal of the above times on that account, giving the short time to the large peas and a longer time to the small peas; but in general, we advocate the above times, with such variations as local or peculiar conditions may make necessary.

Peas are nearly always packed in No. 2 cans.

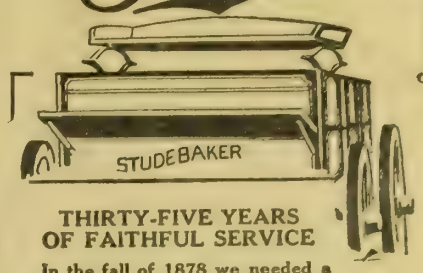
Tomatoes

Scalding: The best method of scalding is with a machine, or machines, so arranged that the tomatoes are first washed in warm water, then subjected to the action of jets of live steam for just a sufficient period to properly start the skin, and are then plunged immediately into cold water before being delivered to the peelers. When tomatoes are washed and scalded in water in the same tank the water must be at an actual, active, jumping boil in order to obtain the best results; and, if afterward they are given a bath in cold water, an effect almost equal to steam scalding may be obtained. Tomatoes thus chilled with cold water, after either steam or water scalding, will be firmer and pack a more solid can and will enable the peelers to

(Continued on Page 525)

Studebaker

WAGONS BUGGIES HARNESS



THIRTY-FIVE YEARS OF FAITHFUL SERVICE

In the fall of 1878 we needed a wagon to haul our wheat. Mr. Smith arose early one morning, and riding one horse, led the other to Eugene, ten miles away, and bought a Studebaker wagon from A. V. Peters, the Studebaker agent there.

I well remember his getting home at midnight, for I sat up and kept his supper warm for him.

My eldest child, born in June, was three months old.

The old Studebaker is still our favorite wagon. It is in good condition.

Mrs. W. T. Smith,
Natron, Oregon

Her "Baby" is now 35 years old—born year Studebaker was bought

MRS. SMITH of Natron, Oregon, well remembers the day her husband drove home the Studebaker, for her little one was three months old. And during all the years he was passing through babyhood, boyhood and on to full-grown man's estate, that faithful wagon was at work making money for the family and cutting down the cost of the investment.

Built with a reputation for durability

Such durability would not seem surprising to you if you knew the methods, the material and the men on which the reputation of Studebaker wagons is based.

Studebaker wagons owe their long life to the manner in which they are built, and the materials built into them. Air dried, selected lumber alone is used. Steel and iron are tested for ability to stand strain and stress. Even the paint and varnish used on a Studebaker wagon undergoes a chemical analysis.

And there is a great deal more in manufacturing wagons than the mere fact of putting wheels, gear and body together. A wagon must hang right and ride right. It must be built to stand rough work, to carry all sorts of loads and to travel over all kinds of roads.

Studebaker has been building farm wagons for sixty-three years, and they know how. Skilled workmen, a model plant that covers over 100 acres, and extraordinary purchasing facilities all help to make the Studebaker Wagon the best.

Studebaker also manufactures Buggies and Harness of the same high standard of excellence.

INSURE YOUR SEED

Get a "catch", a good stand, and a big yield of ALFALFA, BEANS, Peas, Vetch, and *all other Legumes*—inoculate with

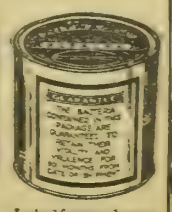
The Improved German Soil Inoculator, Nobbe-Hiltner Process

NITRAGIN

PURE CULTURE

THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES

Gold Medal St. Louis 1904



In half-acre, 1-acre and 5-acre cans

Inoculated Not Inoculated ALFALFA

"NITRAGIN" is the *original* Pure Culture—*a granular* medium (*not* a jelly)—nothing to break or spill—packed in a ventilated can, containing millions of surfaces, supporting billions of nitrogen-gathering germs, their health, strength and virility

Guaranteed for Six Months by the Armour Fertilizer Works.

Absolutely harmless. Easy to use. An investment—not an expense. Remember—legumes not inoculated take *no* nitrogen from the air. Inoculated legumes mean bigger yields, richer feeding value, better soil.

Pure Culture inoculation is endorsed by the U. S. Dept. of Agriculture and other authorities. Thousands of satisfied California ranchers testify to the wonderful results obtained with "NITRAGIN"—the *Original* Pure Culture.

Avoid Imitations. LOOK FOR THE ARMOUR OVAL LABEL.

Make your crop sure. Inoculate with "NITRAGIN". It can be obtained for *any* legume.

See your seed dealer or write for FREE BOOKLET.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

KEEP THE TICKS

We recently inserted a request for some good live chicken ticks. These were requested by Dr. Anderson for a friend in the department of agriculture at Washington who wished them for experimental purposes. We have received oodles of them and we call off the invitation as to sending any more. We did not know there were so many in California. We will give in an early issue of the Cultivator information as to their control.

BALANCE OF TRADE

We have long been appealing for increase in our output of meats and all dairy products because of the fact that we have been sending perfectly good gold to eastern markets for these things which California may as well raise. We are still buying millions of dollars' worth of pork and other meat products, but we are glad to see that in the case of one dairy product, butter, shipments have turned the other way. We are now producing more than we are eating, and butter is seeking an eastern market. We have the right conditions for producing the best on earth. Let us do it and command the very best of the eastern markets.

COOPERATORS COOPERATING

Mr. Vernon Campbell, manager of the cannery of the Tulare County Growers' Association, suggests that there might be objection to the formation of unlimited cooperative canneries in California providing each should remain in the open market and compete with the others in the disposal of their output. Why not form a large clearing house of cooperative associations? Large interests have as a rule definite understandings as to markets. The farmer generally takes the ground that a free-for-all makes things all the more interesting, hence he and his neighbor enter the market in competition, and both suffer. The gentlemen's agreement should be as good for the farmer as for any other business man.

PURE FOOD

The department of agriculture recently took action which should inspire more respect for the national pure food law. Men connected with a baking concern were arrested for using eggs which had long since ceased to be fresh. They were tried in the federal courts and were sentenced to serve terms in prison running from three months to one year.

The eggs used were those rejected in candling in the city of New York. In such large markets of course immense quantities are discarded. Many have reached the stage where they are entirely unfit for human food, but the law permits their use, after they have been denaturized, for technical purposes, the chief outlet being in tanneries.

The effect of these sentences will be salutary.

SIGN UP OR QUIT

The lima bean growers of Southern California have determined to have a greater percentage of the lima beans produced and marketed within the cooperative organization or else all will quit the game. Demand is made that at least 50,000 acres be signed up for a period of five years, and unless this is done prior to June 1 the association which has been in existence for some years will discontinue.

The period of canvassing is about over; the officials are tired of boarding themselves, furnishing their own time, grease and gasoline and soliciting signatures to contracts. Word has been sent to the growers to report at headquarters and sign up, or if they do not do so, it will be taken as an indication of their wish to have the association discontinue.

This is business, and we hope the association will stand by its plan. There are farmers who take delight in being followed up and urged to do things which are for their own interest. It is wearing on the disposition as well as the endurance. When farmers were more ignorant as to the advantages of cooperation it was perhaps advisable to follow the soliciting plan.

CANNING CLUBS

Great interest has been created in many eastern states in young peoples' contests in growing corn and tomatoes and other crops. The tomato producers have in addition to growing the crop often carried the process farther and with home canners put up the product of a quarter, a half or an entire acre. These contests have been encouraged by the department of agriculture and all state universities, and even more by local schools or civic bodies.

California entered into these contests for the first time last year, though we believe none of the contests had to do with canning, but other agricultural work was taken up by boys' clubs and resulted in a trip over the East of a score or more of youngsters from all over the state. This trip was under the direct supervision of B. H. Crocheron, who is also in charge of the farm adviser work of the state. Any community which is not now taking up this work should get in touch with Prof. Crocheron at Berkeley and learn of the possibilities of these clubs and of the advantages they afford to the young people of a community. Of course it is too late for a club to be organized to take advantage of the coming summer's trip. It is now thought the trip will be made up of a much larger party than that of last year. It will take in a circle of practically all states of the Union, but the central point of course will be Washington, D. C., where the work of the department of agriculture and other departments of the federal government will be studied.

F. O. B.

We call attention to a short review of citrus marketing conditions on another page of this issue. In addition to the points there raised we would like to refer to one more partiiularly, that is the much wished for f. o. b. plan. It seems to be sincerely desired by the shippers. If it were what it is claimed to be it would be equally as much desired by the growers. But we take issue with "an orange grower of Pasadena," Mr. George R. Stewart, when he says: "Sure, there must be some objectionable features to selling oranges f. o. b., but most that I have heard advanced are imaginary."

In argument such a statement is easily made, but to make it "take" with certain orange growers who have been in the business for 20 years it will have to be backed up with more than mere statement. The f. o. b. plan caused enormous losses to California growers, and so long as there are growers in California who were growers years ago, the memory of their treatment at that time will prevent adoption of the f. o. b. system.

The same writer seems to think there is a parallel between iron and oranges, for he suggests that iron is not marketed on the selling delivered plan. If iron were shipped every year to the extent of 50,000 carloads a distance of 3000 miles to market and the greater portion had to be disposed of within three months, perhaps there might be a parallel. But that is a type of the argument being used by those who would induce orange growers to return to a discarded method.

SUBSIDING

In The Weekly News Letter we note that "The end of the foot and mouth disease is believed to be in sight." On April 1 there were no animals in this country known to be affected with the disease. This was the first time this could be said since October. However there is no hope that the end is here, for there will probably be many outbreaks and in diverse sections of the country, but with the department now fully awake it is presumed that rigid quarantine measures which have been adopted will succeed, and ultimately the quarantine will be lifted. The department adheres to its original position, and every affected animal must be immediately slaughtered.

By far the greatest losses have been experienced in those states in which there was a widespread belief that the policy of immediate slaughter of all exposed animals and rigid quarantining of all infected districts was unnecessarily costly and troublesome.

Experience, however, has confirmed the official view that only in this way can the disease be eradicated. In certain countries in Europe, notably in Germany, the pestilence has gained such a foothold that the slaughter of exposed animals can not be resorted to and in consequence the widespread prevalence of the pestilence is a perpetual and exhausting drain upon the farmer's resources. In 1911, for example, it was estimated that in Germany there were 3,366,369 cattle, 1,602,927 sheep, 2,555,371 hogs, and 53,674 goats suffering from the disease. Since the total number of these animals in the United States is between three and four times that in Germany the loss to the country would be proportionately greater if the disease were ever to become permanently established here.

Agricultural Notes

A bill has been introduced into the Massachusetts legislature providing for convict labor on highways.

Ten counties of Michigan have formed a cooperative marketing organization to dispose of their fruit crops.

Florida's law prohibiting shipment from the state of unripe fruits has been upheld by the United States supreme court.

It is probable that an appropriation of $125,000 will be asked from the next Florida state legislature to fight citrus canker in that state.

Massachusetts announces that she expects to appropriate $2,000,000 for road work in the western part of the state the coming year.

The annual meeting of the American Guernsey Cattle Club will be held at Hotel Imperial, Broadway and 32nd Streets, New York City, Wednesday, May 12.

Receipts from grazing permits on the national forests for the season of 1915 will contribute to the public revenues approximately $1,200,000, or about $200,000 more than last year.

The Florida Horticultural Society held its eighth annual meeting in Tampa last week with an attendance of over 1200. H. Harold Hume, author of "Citrus Fruits and Their Culture," was elected president.

On March 3 the United States department of agriculture discontinued certification of healthy seed potatoes from infected districts of Maine and New York. The rapid spread of the powdery scab disease in this section has made this step necessary.

It is against the law in Texas for a landlord to charge a tenant rental more than one-fourth of the cotton crop or one-third of the grain crop. Governor Ferguson of Texas was elected last fall on a platform calling for this reform. The idea is to improve the tenant situation.

Artificial milk has been manufactured by German chemists from a basis of casein obtained in soy beans. The possibility of using soy beans in this way was discovered many years ago in China. Another report has it that the Germans are manufacturing a butter substitute from sunflower seed.

The discontinuance of trade relations with Europe has injured the agricultural industry of Siberia. Siberia is choking under the abundance of grain and is suffering from the absence of foreign markets; insufficient connection with foreign markets hinders the economic development of the country and its population.

During the year ending June 30, 1914, forest officers and government hunters and trappers on the national forests destroyed 4135 predatory animals, consisting mostly of coyotes, mountain lions, lynxes, wild cats and wolves. These animals prey upon livestock and cause an annual loss of $15,000,000 to the livestock interests of the United States.

Danish millers are required by the government to extract 64 per cent of the contents of the grain when handling rye and 68 per cent when grinding wheat, or respective recoveries of 141 and 150 pounds of flour from each 220 pounds of grain milled. All millers in the kingdom are required to make a statement of their operations every 44 days in order that the authorities may keep in touch with the situation.

Agricultural News Notes of the Pacific Coast

Northern California

The Butte County Exposition to be held in Chico the latter part of May will make live stock exhibits a big feature.

Farm centers of Humboldt County are raising a fund of $10,000 to be used in the purchase of supplies in wholesale.

A shipment of 50,000 olive trees was recently received at Marysville, Yuba County, for the new nursery being established at Mission.

The famous Durst hop ranch near Wheatland, Yuba County, has been sold and will be placed on the market in small tracts for fruit ranches.

Plum thinning is in full swing in the Vaca valley at present, most all varieties being heavily cropped with the exception of Tragedy which is very light.

M. Sharpe of Vacaville reports: "Vaca shipped about 50 boxes of cherries up to April 23. The first box of Chapmans coming from the ranch of B. K. Fields sold for $35 in Detroit.

Farmers who sell their produce at the Sacramento free market are anxious that the city shall provide another site. The location now in use will not be available much longer.

The Amador-Eldorado Live Stock Association has set aside a standing reward of $250 to be paid any person giving testimony which will lead to the conviction of a cattle thief stealing from any member of the association.

The Eldorado-Amador Stock Growers' Association recently held its semi-annual meeting at Jackson, Amador County. The next meeting in the fall will be held in Placerville. Members of this association graze their herds on the Eldorado national forest.

In a recent issue the Cultivator made note of the organization of the berry growers of Olinda, Shasta County. We have received the following correction of this item from R. E. Paddock, secretary of the Happy Valley Berry Growers' Association: "Olinda is a very small part of Happy Valley and in fact 20 of the 21 members of our association are residents of Cloverdale district and not of Olinda."

At the recent annual meeting of the California Development Board the following officers were elected: William J. Dutton, president; Robert Lynch, first vice-president; A. B. C. Dohrmann, second vice-president; Judge N. P. Chipman, James Ivrine, John P. Irish, Mortimer Fleischhacker, R. B. Hale, B. F. Walton, Chester Rowell, Thos. Maclay, James B. Bullitt, Thomas F. Hunt, P. I. Lancaster, Frederick J. Koster.

At the annual meeting of the Butte County Citrus Association, held Saturday, April 17, the number of directors was increased from seven to nine. The following were elected: Directors, J. A. Lawrence, A. Bartley, F. H. Gray, W. E. Vaughan, R. S. Powers, A. C. Mastellar and A. J. Dunstone. Two other directors are to be later elected from Palermo. J. A. Lawrence was reelected president and Oscar Warner, secretary and manager.

Central California

Gustine, Merced County, sends out 6000 pounds of butter fat daily.

Clovis, Fresno County, had two floats in the big Raisin Day parade at Fresno.

The Tulare Cooperative Poultry Association during March handled 288 dozen eggs.

Artichokes in large quantities are being planted along the coast in Monterey County.

The establishment of an alfalfa mill at Merced was discussed at a recent citizens' meeting in the city hall.

Twelve railroad systems over the country will feature raisins in their bills of fare on Raisin Day, April 30.

An industrial pageant will be a feature of the big parade on Raisin Day in Fresno. There will be 14 floats each depicting a particular feature of the raisin industry.

Two creameries, one in Tulare and one in Fresno County, are planning to ship East several carloads of butter. Last month the overproduction on the coast was about 8,000,000 pounds, it is stated.

The west side of the San Joaquin Valley will produce a crop of wheat double the size of any heretofore harvested. Owing to the war, the price is about twice that of last year, being $2.20 a cental.

The Fresno offices of the California Associated Raisin Company have been enlarged. With the absorption of a number of independent packing houses the business of the Associated has been very largely increased.

One farmer near Mendota in the San Joaquin Valley is planting such a large acreage of tepary beans that it will require ten mules for cultivation. He is so enthusiastic over the outlook that he is figuring on putting into beans another tract of 320 acres in Kern County.

Dairymen of Los Banos, Dos Palos, Volta, Gustine and Ingomar in Merced County met last week to organize an association and establish a cooperative creamery. A committee was appointed in each of the neighboring towns to canvass the local farmers and dairymen.

On April 13 the president signed an executive order eliminating 32,088 acres of land from the Stanislaus national forest. Examination of the land involved showed it to consist mainly of river slopes and hills on the north side of the Merced river. The cover is mainly chaparral, although there is more or less scattering timber in places. The total amount of such timber was estimated to be not over one million board feet. There are very few settlers upon the land eliminated. The climate and soil are such as to render some areas of future value for agriculture, but this value is largely dependent upon the development of water for irrigation purposes, which is now lacking. The examination thus demonstrated that the land is not chiefly valuable for national forest purposes and the recommendation for its restoration to the public doman followed as a matter of course.

Southern California

Last week was made anti-weed week in Santa Ana.

Two cantaloupes were sent from Brawley on April 15 to the Los Angeles market.

Many fields in the Imperial Valley which were planted to cotton last year are this year in barley.

Bee men of Imperial Valley expect a large honey crop this season, 1200 cases being the estimated total.

One thousand orange men attended the mass meeting held in Covina to discuss the marketing situation.

Imperial Valley reports the heaviest grain crop in its history. Harvesting will begin the last of this month.

Horticultural Commissioner Waite of Imperial County estimates that county now has 500 acres set to grape fruit.

In the San Luis Valley of San Diego

A farmers' institute was held at Arroyo Grande, San Luis Obispo County, April 12. A picnic lunch was enjoyed.

County there will this year be planted about 200 acres to experimental tracts of beans.

J. H. Wilson has been named as president of the Sixth National Orange Show to be held in San Bernardino February 18, 1916.

It is reported that all the sugar factories in the state will run this year. Southern California hopes for a $15,000,000 sugar beet crop.

Some ranchers in Santa Barbara County have begun planting beans but the majority will wait until the 10th of May to do their planting.

Orange County dairy and creamery men are watching with much interest the fight against Los Angeles manufacturers of homogenized cream.

The Escondido farm bureau met Monday, April 12, to discuss tomato culture. A plan was considered for organizing tomato growers into a special association.

A meeting of orange growers held at Redlands last week was addressed by Manager Powell of the exchange and P. J. Dreher, manager of the San Antonio exchange.

Dr. Cady, a hog cholera expert from the University of California, has been in San Diego County the past week giving demonstrations of the use of hog cholera serum.

At the meeting of the Escondido farm bureau on Monday, April 12, two committees were named, one to secure a tomato packing house, made up of J. W. Sherwood, C. T. Haney and G. W. McCreery, the other to secure a canning factory for second grade tomatoes, composed of Guy Whetstone, G. Humphrey, Frank Hull, G. W. Wisdom and J. H. Heath.

Roland McKee of the U. S. department of agriculture, who is stationed at Chino investigating forage crops, visited the citrus experiment station at Riverside last week. To Mr. McKee is credited the introduction of purple vetch into Southern California. The purple vetch resists aphis better than the ordinary variety and also makes a heavier and earlier growth.

The Coast

Chandler, Arizona, is assured of a creamery and ice plant.

Heavy frosts the first of the month did some damage to fruit near Toppenish, Washington.

The Chandler, Arizonan, reports that over 125,000 head of sheep are pastured east of Chandler for shearing.

The Roosevelt reservoir, which supplies the Salt River Valley of Arizona, has now 1,500,000 acre feet of water stored.

A San Simon Valley goat raiser who has a herd of 1800 Angoras claims to make his goats average 6½ pounds of mohair per season, at two clips.

Arlington, Oregon, reports sheep shearing in full swing with quality of clip much better than last year. The fleeces are cleaner and the staple longer.

The reclamation service has sent word that water will be cut off from all ranches in the Salt River Valley of Arizona where waste water is allowed to go on the roads.

It is reported that wool buyers in the Williamette Valley, Oregon, have offered 27 cents but are not finding much wool for sale even at that price. Growers are holding tight.

County Farm Adviser Paschall for Cochise and Santa Cruz Counties, Arizona, is receiving so many requests for pure seed that he has requested all farmers having seed, especially corn, for sale to send him variety, quantity and prices.

In an endeavor to find some bright side to the apple marketing situation in the Northwest this year a statistician has discovered that the average price for the past five years, including the present season, is about $1.00 per box net to the grower.

The board of governors of the Salt River Valley Water Users' Association have recently ruled that 32,000 acres of land outside the original project area shall be supplied with water as long as there is in excess of one million feet of stored water in the reservoir.

The Hood River Apple Growers' Association has withdrawn from the North Pacific Fruit Distributors. It is probable that a marketing alliance will be formed between the Hood River Association and the fruit growers of Southern Oregon and the Rogue River Valley.

The North Pacific Fruit Distributors has reorganized as a result of the past bad season and the withdrawal of the Hood River District and will this season act as a selling agency only. The fixed marketing charge has been abolished and operating costs will be paid according to tonnage.

The Arizona State Poultry Association has appointed a committee to interview poultry dealers throughout the Salt River Valley and persuade them to make May first Rooster Day, a day when dealers will buy all roosters at a fair price with the understanding that producers are to shut up all roosters carried over as breeders and produce only infertile eggs.

90% of gas engine trouble has always been due to faults of ignition

The "Alpha" Engine

2 to 28 H. P. Portable or Semi-Portable, Water Cooled or Hopper Cooled

"The gas engine without batteries"

Stops ignition trouble

THE ALPHA IGNITION EQUIPment consists of a gear-driven, positively timed, built-in magneto, which we guarantee will last as long as the engine, and a simple, well built and positive igniter. A hot, fat spark is developed which quickly ignites the whole mixture in the cylinder and enables the production of maximum power from the minimum amount of fuel.

ALL ALPHA ENGINES NOT only operate but **start** on this magneto. It is hard to believe it until you see it done. In starting even the largest size Alpha Engine, only a partial turn of the fly-wheel is required and the engine goes right to work. No fussing or stewing over batteries, coils and spark plugs with which other engines are equipped.

THE ALPHA ENGINE IGNItion system is so much simpler that once you see it done you can do it yourself. No trick about it. If you have had any experience with gas engines you will readily appreciate the great advantage of the Alpha in this respect, and even if you don't know gas engines, an inspection of the Alpha Engine will certainly convince you of its simplicity of construction and the excellence of its material and workmanship.

THERE ARE A DOZEN OTHER points of superiority of the Alpha that are just as important as the advantages of its ignition system, and these the nearest Alpha agent will be glad to explain to you. If you don't know the name of the Alpha Engine agent in your locality, we will be glad to put you in touch with him, or if there is no Alpha agent in your neighborhood we will send one of our own representatives to see you, upon request.

IN ANY CASE, WE SHALL BE glad to send you the finest gas engine catalogue ever printed.

CALF FEEDING

Written for the California Cultivator
By Leroy Anderson

IN answer to a subscriber's request for suggestions for weaning and feeding calves the following is submitted:

It is wise that the new born calf should have the first, or colostrum, milk of its dam as it is essential to properly start the organs of digestion. The calf may be allowed to suck the first day or may be removed as soon as born and fed the milk. Removing the calf at once usually renders the cow less uneasy, but it is more difficult to make the calf drink all the colostrum milk it needs than to let it get it from the cow. Since the cow's milk is not used for domestic purposes for four or five days the calf is assured of whole milk for that time. Whole milk should be continued for about ten days, when a little of it may be replaced by skimmed milk. During this time a large calf may be fed five or six quarts or ten or 12 pounds daily. If it can be given in three feeds, all the better for the calf. For a small calf, as a Jersey, eight or ten pounds are sufficient. The change from whole to skimmed milk should be gradual. For instance, each day substitute one pound of skim for one pound of whole milk, and in ten days the calf is entirely on skimmed milk. The calf is then three weeks old and the amount per day may be increased until it is receiving 16 to 18 pounds, which is enough for almost any calf.

Grain and Hay

Skimmed milk is in all respects like whole milk except for butter fat. The grain fed should provide for the loss of fats and one of the best feeds is corn meal. If a person has but one cow and wants to do especially well by the calf he may buy flaxseed meal—whole flaxseed ground and none of the oil removed. A handful of this with each feed will make bossie grow. Or whole flaxseed may be used by boiling it and feeding the jelly in the milk at the rate of about one tablespoon unboiled seed at a time. But flaxseed is rather expensive to feed to many calves. Linseed oilcake meal is also expensive and has lost most of its oil in the process from flaxseed to meal. Cocoanut oilcake meal is now cheaper than linseed by about $15.00 a ton and contains more oil than the linseed meal. It is a safe feed so long as it remains sweet. As it has a tendency to become rancid it should be purchased only in such quantities as will enable one to feed it within a few weeks. Corn meal is now quoted as high or higher than linseed oilcake meal. If corn meal is used a good mixture is one part each of corn meal, linseed or cocoanut meal, and wheat middlings.

When the calf is about two weeks old give it a little grain from the hand just after it has had its milk. In a few days it will learn to eat grain when the grain may be left before it continually in a box or trough. If the other feed is good the calf will not need more than a pound a day of grain up to five or six months old, and when it begins to eat more than that feed the required amount daily. Rolled barley is too coarse for very young calves but may be given when they are two or three months old. The barley may then take the place of corn meal and linseed meal. If ground, instead of rolled, any objection to barley for young calves is removed.

If hay is left before the calves they will begin to nibble at it soon after they learn to eat grain. Alfalfa of good quality is the most palatable and nutritious and may render grain unnecessary when the calves are a few months old, but when taken off milk, the grain had best be continued unless pasture is available.

Some Cautions

There is more danger of overfeeding than underfeeding young calves. Overfeeding brings on indigestion and may lead to scours, a much dreaded disease among calves. The same trouble may be caused by coarse feed when the calf is young, and another type of scours is of bacterial origin and infectious. That caused by indigestion may be removed by reducing the feed one-half or less and by giving some correctives. A tablespoon of dried blood to each calf at feeding time has given much satisfaction. If the case be very bad drench the calf with a dose of three ounces of castor oil in a pint of milk. Infectious, or white scours, needs not only the corrective treatment but careful disinfection of the entire calf quarters. Scours gives a calf a bad setback in growth and every means should be taken to prevent the disease from gaining a hold.

Always feed milk when warm and sweet. Cold or sour milk deranges the digestion. Milk direct from the separator and containing air also disturbs the digestion and may bring on scours. Get the air out before feeding. It is well to give calves access to clean water for drinking at all times no matter what their feed.

Skimmed Milk for Beef Calves

While we are on the calf question, I want to quote a Nebraska experiment, reported in bulletin 68, on raising calves on skim-milk versus sucking their dams. Six range cows were selected showing Shorthorn or Hereford blood and all were in calf to a Hereford bull. The calves of three were weaned and raised on skimmed milk, grain, pasture and hay. Their dams were milked and the milk made into butter. The other three cows raised their calves in ordinary range fashion. The record was kept for five months, at the end of which time the cost for each pound of gain from birth was calculated. For the skimmed milk calves this cost was 2.8 cents. To find the entire cost on the nursing calves there was added to the pasture for them and their dams, the value of the butter made from the dams of the skimmed milk calves. This makes the cost per pound of gain on the nursing calves to be 8.6 cents or 5.8 cents more than for the skimmed milk calves. The total difference in cost for five months was $50.27. The labor of milking the cows and feeding the calves was not considered in the cost account. This is worth considering but is probably not equal to the difference of $50. The average weight at the end of five months of the skimmed milk calves was 333 pounds, of the nursing calves 347 pounds. It was also easy to pick out the nursing calves as they were rounder and plumper than the others. But when all were a year old no difference between them could be detected.

This experiment is useful in these days of beef scarcity, for it shows that good beef animals can be grown on the same kind of a ration that is used to grow dairy calves. Not only male calves from milking Shorthorns can be made into good beef but when grass and hay are now so cheap it doubtless pays to raise the male calves of the larger dairy cows and make them into beef.

Summary

Nothing has yet been found that beats skimmed milk as a whole milk substitute for calves.

To supply the fat lost in skimming use corn meal or ground barley. These do not contain much fat but the carbonaceous matter (starch, etc.) in them takes the place of it. A little oil meal helps digestion. Wheat middlings or fine bran ought to go with the barley or corn meal.

The point is to induce the calf to eat grain and hay at as early an age as possible. Thus it becomes less dependent upon the milk diet and starts early the normal habit of the ruminant.

Good calves may be raised on milk substitutes.

EFFECT OF LARGE RECORDS ON FURTHER USEFULNESS OF DAIRY COWS

The statement is often heard among dairymen that the big record cows are injured in the making of the record and that after the record is finished their period of usefulness except for advertising purposes has passed. In order to obtain some definite data on the subject the Guernsey cows which have completed records of over 700 pounds of fat have been studied to determine the effect of the records on the further usefulness of the animal as a factor in eventually producing human food.

There are 63 Guernsey cows who have produced over 700 pounds of fat. Of this number three have four official records the first averaging 548 pounds of fat, the second 567, the third 674, and the fourth 810. One of these cows has produced to date 10 registered calves, four of which have been born since making the last record and she is carrying at the present time her eleventh calf. One of the others lived to 10 years of age and produced six registered calves in that time. The other lived to be nine years of age and died from blood poison contracted at calving time. Regarding her work the owner said, "She was so delicate looking that I held off breeding her until late, she being 3½ years old before producing her first calf."

She was immediately entered for the advanced register and produced a living registered calf after each record except the last as stated above and has a total of four calves to her credit. One of her daughters calved at three years of age late in 1912, has a record of 730 pounds of fat, has two living daughters and is safe in calf at the present time.

Ten cows have three records each the first averaging 513 pounds of fat, the second 701, and the third 805. Of these 10 cows all but two have either produced registered progeny since making their last record or are safe in calf at the present time. One cow has produced four calves since completing a record of 836 pounds of fat, another dropped two calves and the others, with one exception, have dropped a calf or are safe in calf at the present time.

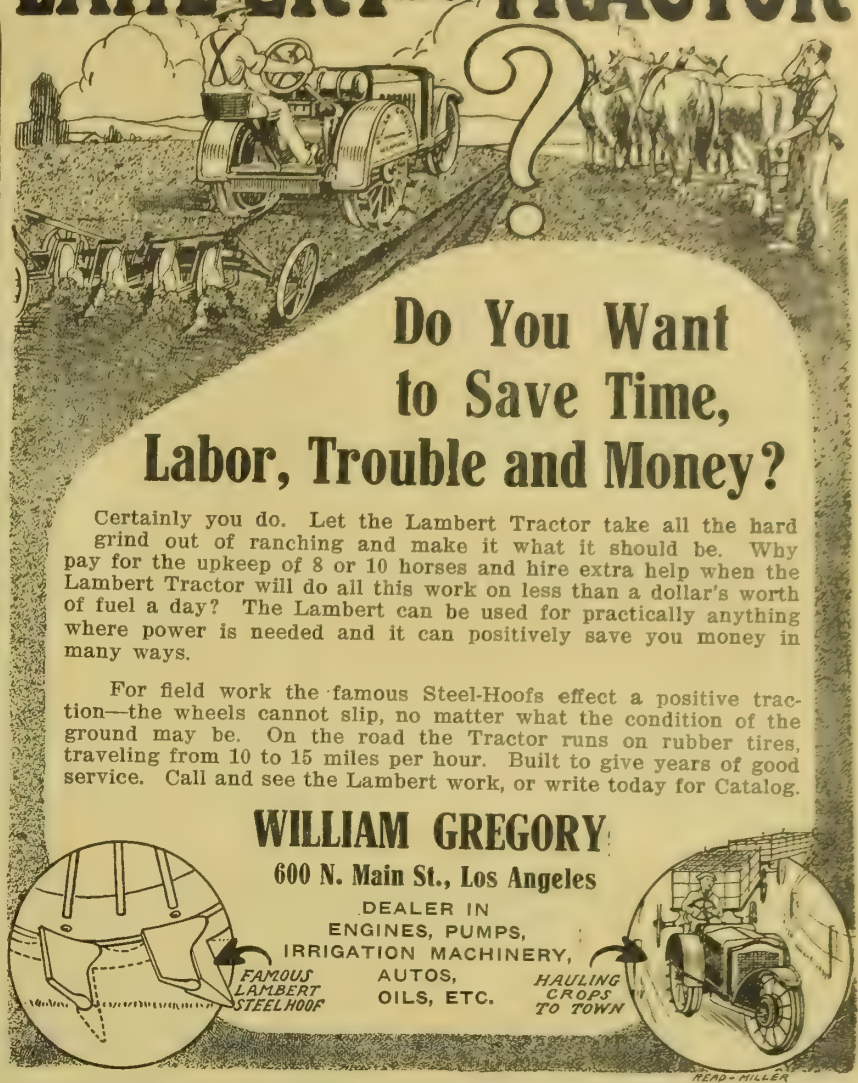
There are 28 cows that have produced over 700 pounds of fat that have two records. Of this number 11 have completed their records so recently that if a calf has been born since it would not necessarily be registered at the present time. Of the 17 remaining 11 have produced calves since making their records or are safe in calf. One cow who made 533 pounds of fat as a two-year-old has produced five calves since making her last record of 714 pounds of fat and is safe in calf at present. Another who as a two-year-old made 424 pounds of fat has produced four calves since making her last record of 778 pounds of fat and is safe in calf. Another produced five calves after making her last record of 725 pounds of fat having made 547 pounds of fat the previous year. She died at the age of 12 years and has nine registered calves to her credit. Of the six who have not had any progeny since making their 700 pounds or over record one died of a broken leg shortly after the record was made and another was killed on account of an accident shortly after completing her record. As to three of these cows we have not been able to obtain any data and they may or may not be in calf at the present time.

There are 22 cows of the 63 that have only one official record and all but three of these have produced calves since making their records or are safe in calf.

It may be true that there are isolated cases where the future usefulness may be injured where improper care and feeding has occurred during record work, but we cannot but feel there are very few instances among the heavy producers of Guernseys today where injury has been noted as the result of official testing.

On the other hand the results obtained in cases where cows have made two or more records point conclusively to the fact that advanced register work has been a material aid in the development of the individual animal as well as in the breed in general.—American Guernsey Cattle Club.

LAMBERT STEEL HOOF TRACTOR



Do You Want to Save Time, Labor, Trouble and Money?

Certainly you do. Let the Lambert Tractor take all the hard grind out of ranching and make it what it should be. Why pay for the upkeep of 8 or 10 horses and hire extra help when the Lambert Tractor will do all this work on less than a dollar's worth of fuel a day? The Lambert can be used for practically anything where power is needed and it can positively save you money in many ways.

For field work the famous Steel-Hoofs effect a positive traction—the wheels cannot slip, no matter what the condition of the ground may be. On the road the Tractor runs on rubber tires, traveling from 10 to 15 miles per hour. Built to give years of good service. Call and see the Lambert work, or write today for Catalog.

The Day is Drawing Near

to the

Great Dispersion Sale

of the P. F. Schumacher Herd

of

75 — Registered Holsteins — 75

at

Ascot Park, Los Angeles, May 12, 1915

Are you going to be one of the satisfied purchasers? Consider carefully the following facts and we think you will be.

There are more high record cows in this sale than in any sale previously held in the West, including a cow with an official record of 29.27 lbs. of butter in 7 days, one with a 28.85-lb. record and a 20-lb. four-year-old and an 18-lb. two-year-old. Also eight other A. R. O. cows, among them sisters of the above great record cows and a daughter of Alba Sadie Cornucopia Creetia, as well as daughters and granddaughters of many of the most famous sires of the herd. They are as good individually as they are well bred, and include a third prize winner at the National Dairy Show in Chicago and first prize calf at the Colorado State Fair. MANY ARE BRED TO THE GREATEST YOUNG SIRE OF THE HERD, TILLY ALCARTRA SON, junior herd sire of the McAlister & Son herd, and son of the only cow to make over 30,000 lbs. of milk in one year. Think what their calves will be worth.

And a great lot of bulls of just the right age—right markings, right conformation and right breeding. They are sure to please the most discriminating purchaser.

TERMS: $500 and under, cash; over $500, one-third cash; balance, in three equal payments in three, six and nine months' time, with note and approved security and 8% interest. 5% discount for cash on time sums.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Skin Disease

I have a horse which was troubled a great deal with itching last summer, constantly rubbing his sides and tail against the corral fence and would get small lumps all over his body. I tried condition powders and different stockfoods at the time but nothing seemed to help, also called a veterinarian who gave me some liniment, but it gave no relief; tried several remedies suggested by neighbors but everything without avail. During the winter when the weather was colder he was bothered very slightly, but now that the warm weather has started in the itching and lumps have also commenced again. Had him clipped in January, also washed him several times last summer.—Subscriber, Lankershim.

Mix two powders of epsom salts, one pound of common salt and half a pound of wood ashes. Give him a small handful of this once a day. Also get one pint of Fowler's solution of arsenic and give a tablespoon on the feed once a day. If this does not cure him then the trouble is due to a mite in the skin. For that use a solution of zenoleum. Wet him all over with this once a week for three or four weeks.

Book on Disease of Horses

Can you recommend a book that will enable a farmer to treat sick horses."—Subscriber, Nestor.

The Bureau of Animal Industry at Washington publishes a book on diseases of the horse that you can probably get by applying to your representative. You would do well to follow the questions and answers in the veterinary column of the Cultivator and either clip them out or save the whole paper. During each year the questions and answers cover about all the common diseases and, if you are a subscriber, you are at liberty to ask for what you do not find.

* * *

The book referred to by Dr. Petrie is "Special Report on Diseases of the Horse," issued by the Bureau of Animal Industry. It is a valuable book of nearly 600 pages. A companion book is "Diseases of Cattle," issued by the same bureau and written by practically the same veterinarians.—Editor.

Wire Cut on Udder.

Last May I had a cow cut on wire so that the milk ran out of one teat. Veterinarian sewed it up, but the stitches pulled out. Had it sewed the second time and then as the stitches again pulled out we bound it up with adhesive tape, which we renewed every day or so and syringed it out with creolin. She was a heavy milker and had only been fresh a little over a month so we were obliged to use a tube to draw off the milk. The teat seemed to heal nicely but the udder has swelled up a number of times since and broken. She is due to freshen in May and I would like to know if I run a risk and how so in letting her calve. I hate to sell her for beef as I cannot get nearly what she is worth as a milk cow, but do not wish to run too much risk. Subscriber. Waukena.

The udder should receive careful attention before she is fresh. Bathe it often with hot water, and if much milk is secreted it should be milked out at least once a day. Rub the udder with the hands when bathing it, also mix four pounds of epsom salts with two pounds of common salt and give her a large handful of it once a day. She may give you some trouble in spite of all the attention you may give her but such cases frequently recover fully.

Hip Hurt.

Three weeks ago bull hurt his hip joint and has been lame since. The joint sticks out large as your fist. Sometimes he walks lame. Please tell me what to do for him. I have blistered him but it does not seem to do any good.—Subscriber, Earlimart.

From your discription it seems that it is the point of the hip that is hurt; there is no joint there. Probably the end of the bone is broken and may give him trouble for some time. The less exercise he has the better. Liniment and blisters will do no good.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Final Decree of Divorce.

Sometime ago a subscriber asked if he could get a final decree at the end of a year. His wife got the interlocutory from him by default. You answered that the judge may upon request of either party grant final decree. Now must the judge grant the husband the final decree if he requests it, or can he refuse if he so desires? In case he does refuse would the husband be guilty of bigamy if he married again at end of year, outside of state of California, say Mexico, Texas or Nevada and stayed there?—Subscriber, Bakersfield.

The reading of the statute is that the court upon motion of either party or upon its own motion may enter final judgment granting divorce, and such final judgment may restore them to the state of single person and may permit them to re-marry after entry thereof. There are many causes for which the judge may refuse to enter the decree, and until the final decree is entered the parties have the status of husband and wife and they would be technically guilty of bigamy if again married. In the usual case the final decree is made as a matter of course.

Shooting Game Birds.

In Cultivator of March 25 in answer to the question "Has one a right to shoot quail or rabbits on his own place, out of season, when they are destroying crops?" I think your answer would lead one to think that one could shoot quail and eat them, even out of season, if he could make the excuse that they were destroying crops. As I understand it one can shoot protected game birds or animals when such birds or animals are found destroying crops, but they must be left lying where killed and not picked up and used for food or even given away.—Subscriber, Escondido.

The reading of the statute is "Nothing shall prohibit the killing of wild birds by the owner or tenant of such property where the bird is found destroying the berries growing on such premises, but the bird so killed shall not be shipped or sold." The destruction of crops is the only defense that a person could make for killing a game bird, and if the court or jury found that the birds were in fact not destroying crops, the defense would of course fail. I fail to see any reason why birds bona-fide shot for destroying crops could not be used for food, but they could not be shipped or sold.

Estray

A horse broke into my pasture. How do I proceed in a legal manner to find the owner and in case I do not, what then?—Subscriber, McFarland.

A person taking an estray must confine the same and within one week publish for two weeks in a newspaper printed within the county, and file with the county-recorder, a notice containing a description of the animal, the mark or brand, if any, its probable value, statement of the place where found and where confined. If within 30 days from the filing of the notice

(Continued on Page 527)

Poultry for Profit

COOPERATION FOR EGG PRODUCERS

A COOPERATIVE plan to reduce the enormous waste now caused by the careless marketing of eggs is outlined in Farmers' Bulletin 656: "The Community Egg Circle", which has just been published by the United States department of agriculture. It is estimated that under the present haphazard methods of gathering and marketing eggs nearly eight per cent of the country's output is a total loss. Since the annual production of poultry and eggs in the United States is valued at more than $600,000,000—a sum equal to the value of the hay or wheat crop—the importance of reducing this loss is obvious.

The individual farmer too often regards his eggs as a mere by-product to which it is hardly worth his while to devote himself seriously; in consequence he is inclined both to neglect his poultry and to gather his eggs whenever he happens to have a spare moment or two. In consequence the output of his poultry yard is not only small to begin with, but a large proportion of it has begun to spoil before it reaches the hands of the country merchants. They usually buy the eggs on "case count," paying the same price for good, bad, and indifferent. The large markets, however, do not pay the same price and reject many altogether; in consequence the price per egg to the farmer is made sufficiently low to provide a safe margin and to cover the loss on eggs of poor quality.

These conditions have been so firmly established by long usage that the individual can do little to alter them unaided. Community cooperation, however, can quickly raise the standard of the eggs shipped from any one neighborhood, and with the standard the price. The fancy trade is quite willing to pay more for a guaranteed article and the extra cost of producing the guaranteed article is more in pains than in cash.

The plan outlined in the bulletin already mentioned calls for the organization of a community egg circle which should include as soon as possible enough members to warrant the employment of a manager. Each member agrees to gather his eggs daily and in hot weather twice a day, to keep them in a cold place, and to deliver none that is more than seven days old. No eggs are to be washed and the male bird is to be kept away from the flock except during the mating season.

The manager of the circle inspects, grades, and markets as a whole the deliveries the members make to him. Payment is to be made to the members in proportion to the number of eggs of each grade that they deliver and the prevailing market prices, less their proportion of the necessary expenses. The bulletin also gives suggestions for convenient receipt forms which will enable the members to check up their payments with their deliveries.

Such a system will enable the circle to make arrangements for delivery of regular supplies to the best and most discriminating class of trade. There is always a demand for guaranteed eggs on the part of clubs, hotels, restaurants, and even well-to-do private families, but the individual farmer rarely has a sufficient output to enable him to make a contract with any of these consumers, and the country merchant has no means to guarantee to the consumer the eggs that he buys from individuals over whom he has no control. Cooperative marketing also enables the eggs to be put up in attractive cartons which can be turned into valuable mediums of advertising and reduces the expense of shipments. The increased returns, furthermore, will encourage the producer to devote more time and care to his stock, better hens will be kept, they will be kept in better condition, and in consequence there will be more eggs as well as better ones.

WHY MEETING OF A. P. A. SHOULD BE HELD IN SAN FRANCISCO

By T. E. Quisenberry, Superintendent of Poultry, P. P. I. E.

San Francisco is the logical place for the annual meeting of the American Poultry Association in 1915.

The nominating ballot shows a large majority of those voting advised this location for the meeting place of this, the world's largest live stock organization.

The railroad fare from St. Louis, Chicago and surrounding points to the Atlantic City Convention two years ago cost A. P. A. members as much as the fare this season will be from those points to San Francisco.

No guarantee of new members or of any other nature was demanded of Atlantic City or of Chicago last year and the year previous.

The central west and the western members voted for Atlantic City in 1913 and Chicago and other points in 1914 because they were given to understand that the eastern members would reciprocate and vote for San Francisco in 1915.

The West is the most fertile and undeveloped field which is open to the poultry breeders of America today.

You will meet with a most cordial welcome from the exposition authorities and from the Western members of the American Poultry Association.

A large majority of the members of the American Poultry Association will want to visit this great exposition any way, why not do this and attend the A. P. A. convention while on the same trip?

This being a national organization, the members of the association and the poultry breeders of the western coast are entitled to at least one meeting of the American Poultry Association in every 40 years.

A visit to the Panama-Pacific International Exposition is worth four years' training in an agricultural college or university, or is equal to a trip round the world if you will but take time to study the most wonderful collection of exhibits ever shown at one exposition.

We cordially invite you to hold your Fortieth Annual Convention in San Francisco in 1915.

"POULTRY FOR PROFIT"

This is the title of a brand-new book on poultry published by that old reliable Cultivator Publishing Co., Los Angeles. The author, Jean A. Koethen, has really written a poultry book worth while. The different subjects are treated with a directness that is refreshing after reading so many books that say so much and mean so little. The book is intended for the beginner and farmer, but we commend it most heartily to anyone interested in poultry, whether for pleasure or profit; it is full of good things from cover to cover. The book is handsomely illustrated and well bound in cloth, and sells for one dollar. —Pacific Poultrycraft.

HE WAS MISTAKEN

"I asked your husband last evening if he had his life to live over again if he would marry you, and he said he certainly would."

"He certainly wouldn't."—Houston Post.

Tells why chicks die

E. J. Reefer, the poultry expert of 905 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

FARM LANDS FOR SALE

Money Making Ranch—86 acres near Watsonville, all rich sandy loam, 20 acres 11-year apples, 20 acres 10-year apricots, 10 acres 3-year apricots; 1914 6000 boxes apples, 75 tons apricots. Balance land good fruit soil; now in grain, corn, etc. New house of 6 rooms, modern, barn and ideal poultry and fruit farm equipment. Everything in personal property, stock, furniture, etc., included. Get full details and be convinced of this splendid buy. Price, $26,000; terms. E. Steinhauser, Watsonville, Cal.

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways, free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa, corn, grains, fruit, etc.; climate like California; ample markets; reduced passages; special excursion being arranged. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

For Sale—200 acres of land in Imperial Valley, 80 acres leveled up in crop of corn this year. Buyer gets one-fourth of crop delivered in sack at R. R.; 120 shares of paid up water stock. Good house on place. Price, $80 per acre cash. Might consider a trade to the extent of $3000 or $4000 in desirable property near Los Angeles. The balance in cash. Address George Thresher, Gridley, Route 1.

For Sale—16-acre apricot orchard, trees mostly two years old. Soil a fertile, sandy loam, not steep, no frosts or winds; small house; good spring. Situated one and one-half miles from town on County road. Price $3500.00. Terms $1500.00 cash, balance long time and easy payments. No exchange. Direct communications to J. J. B., Rural Route No. 2, Watsonville, Cal.

County Sectional Maps—Showing vacant government land, $2.50 any county. VERY PLAIN. Easy to see and select your choice. Booklet and circulars FREE. Write Joseph Clark, Searcher of State and U. S. Records, Sacramento.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange—Ten acres planted to two year old Valencia orange trees, at North Whittier Heights. Will consider trade for vacant lots. Box 54, Glendora.

For Sale—Orange, olive, peach and rice land. Close in, on good terms. Fred Hart, Exeter.

FARM LANDS FOR SALE

For Sale—800 acres of fine valley land, situated in Santa Maria Valley near the town of Ramona. 30 miles from San Diego, 10 miles from a railroad. The soil is especially adapted to the growing of figs, olives, peaches, plums, grapes, oranges and many other crops; for particulars apply to owner. F. J. Etcheverry, Ramona P. O., San Diego Co., Cal.

For Sale—20 acres, Yolo County. Near State Farm at Davis. I will furnish alfalfa, beans and corn seed, also necessary farm implements. Plant now for the season's crop. See alfalfa and berries growing on the land. Dudley Moulton, 12th Floor First Nat'l Bank Bldg., San Francisco, Cal.

For Sale Or Exchange—Five-acre, frostless, foothill orange grove; income $2721.67 for one year. McGarry, 519 Union Oil Bldg., Los Angeles.

MOTORCYCLES

Order Your Motorcycle accessories and motorcycle parts direct by parcel post and save money, as we carry a complete stock, spring tandems, tires of all makes, lamps in all sizes, horns, and everything pertaining to motorcycle accessories, we have it. Also a fine selection of used motorcycles, consisting of the following makes: Excelsior, Indian, Thor, Harley and many other makes. We pay the freight on any motorcycle you buy from us. Write for a price list. Fred H. Bente, mgr. Excelsior Agency, 1550 Market St., San Francisco, Cal.

TO EVEN IT UP

Johnny—Maw, I haven't got enough butter on my bread.

Mother—Well, then, put some of the bread back.—Boston Transcript.

When the donkey saw the zebra
He began to switch his tail;
"Well, I never," was his comment;
"There's a mule that's been in jail!"
—The Horse Lover.

When you mean to tell a thing on the housetops, it is wise to see to it that the thing is worth telling.—C. Hanford Henderson.

MOVED

The Redwood Manufacturers Company have removed their San Francisco offices from the Kohl Building to the sixteenth floor of the Hobart Building, Market and Montgomery Streets, San Francisco.

In conjunction with the parent corporation, the Caspar Lumber Company, they occupy the entire sixteenth floor of the tower of the Hobart Building, which gives them a suite of the finest offices on the coast. The view from their windows is unsurpassed.

Their friends are cordially invited to call on them in the new offices and take a birdseye view of San Francisco.

SOIL SENSE

The Dunham Company of Berea, Ohio, will mail on request a book which has a fund of information about soil culture in general and about soil culture with implements which this concern has to sell in particular. There are hints as to "Digging for the Truth." "For the man who is a thinker there is no better way to learn about soils and crops than to get out in the field and dig for the truth."

There are several paragraphs given to suggestions as to "How the Truth May Be Dug From the Ground," then there is another chapter on How Roots Grow, Making a Fine, Firm Seedbed, Soil Moisture, Storing Moisture in Soils, Getting Stored Moisture to the Plant, and numberless other hints with illustrations. The book is well worth requesting.

WHAT IS FABRIKOID

In the shortage which it is predicted will be still greater as to the live stock industry it is of interest to note that a manufactured leather is possible. Of course, it is hardly proper to call it leather, but it has practically all the wearing quality of the real article. This substance has been named Fabrikoid and it is used in upholstering furniture and automobiles, for wall coverings, for suit case manufacture, and many other purposes. A letter to the Dupont Fabrikoid Company, Wilmington, Delaware, with request for "How Many Hides Has a Cow?" will doubtless bring a pamphlet of considerable interest to those having occasion to use this new leather manufacture.

Mr. McAlister, manager of the coming sale of Holsteins to be held in Los Angeles, writes:

"It may interest your readers to note that one of the four-year-olds to be sold at the Schumacher dispersion sale has just made 20 pounds of butter in seven days and a junior two years old better than 18 pounds of butter in seven days. The latter, I believe, is one of the largest records ever made by a junior two year old in the state. There will be over 12 A. R. O. cows in this sale bred to the famous young herd sire, Tilly Alcartra Son, son of Tilly Alcartra, the only cow in the world to make over 30,000 pounds of milk in a year. Stop and consider what their calves will be worth."

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Thin Shelled Eggs

Please advise me what to do for thin egg shells. Have unslaked lime. Would it be all right to feed them the softened air-slaked lime, scattering it on the ground?—Subscriber, Fairmead.

Lime in the form of old plaster is usually to be preferred to the thickened or cream of lime. In the absence of the old discarded plaster would use good fresh stone lime and mix with a liberal quantity of sharp sand, at least two or three times as much sand as lime. When this is set and dry it may be broken up and the chickens take to it readily.

Gum on Apricot Trees

Last year we set about 1000 apricot trees and this year find there are a number affected with a disease called gum disease. Do you know if there is anything we can do for it?—Subscriber, San Jacinto.

This gumming is probably caused by poor physical condition, especially some trouble with the sap of the tree. It is probably not of a fungous nature, but a perfectly safe treatment would be to remove the gum and treat the wound by painting with Bordeaux paste.

Asparagus Culture

I should like what information you can give as to proper soil and cultivation of asparagus. Can the roots be planted in white alkali soil if mixed with a rich loam? Also will the plants do well if planted in rich loam mixed with sand? Do the roots grow deep enough to allow cultivation sufficient to keep out salt grass? Do they need much water during the summer months?

Asparagus revels in alkali soil, in fact, in commercial gardens salt is often applied. Use a top dressing of stable manure. The rich loam should make a good asparagus garden. With thorough cultivation salt grass should be easily kept down. Water may be withheld during the summer months after harvesting is over.

Artichokes

Please give information regarding care and cultivation of artichokes. There are many suckers coming on them. Should they be used for propagating other plants—Subscriber, Arroyo Grande.

Propagation of these plants is by seed, though where a fine variety is developed it is propagated by using portions of the old plant or by dividing up the stools or suckers. Remove shoots with knife and take with them if possible some portion of the parent root. The rows may be four or five feet apart while three feet is the usual distance apart in the row. Remove flower buds as soon as they are formed and before the scales open.

Breeding of Milch Goat

I have a mlich goat which I was told was bred when I bought it. She has not kidded for two and a half years and is now four years old. Is it possible that having failed to breed for so long she has become barren?—Subscriber, Los Angeles.

This question is answered by Mr. Winthrop Howland, breeder of Swiss Toggenburgs at Redlands:

"Unless some organic condition was wrong with the doe she could be bred successfully provided she was in proper condition. My experience has taught that does may miss kidding a year and bear kids normally the following year. Sometimes does kept in corrals become too fat to breed, and it is best for such does to be turned out to pasture for a summer, where by fall this condition is so improved they should breed readily. I have known does to be bred three or more times successively and finally conceive after many such successive breedings. Other does were found to be infertile even after having once borne kids, but such cases are extremely rare. As a rule does are easily got with kid."

Cider

Does apple juice become cider as soon as it is expressed from apples; that is, sweet cider, or is sweet cider and apple juice the same?—Subscriber, Loomis.

Webster's definition of cider is: "The expressed juice of apples (or formerly of some other fruits) used for drinking, for making vinegar, and for other purposes. Hard or fermented cider contains from two to seven or eight per cent alcohol." Therefore we take it the moment it is expressed from apples the juice becomes cider.

Skin Disease

My colt rubs itself a great deal and has eruption of the skin. What can I do for it?—S. K. R., McFarland.

There are many skin diseases and while they all require the same general treatment, that is, they are benefited by antiseptic washes and by internal remedies which clear the blood, they are yet so diverse that materially different treatment may ultimately be required. Therefore, in the absence of more specific information would suggest to the inquirer; first, the giving of a laxative—a pound of Glauber's salts in three or four quarts of water or one and one-half pints of olive oil. Following this a couple of drams of bicarbonate of soda twice daily in the drinking water is helpful. As a wash for the skin use a dram of bicarbonate of soda and a dram of carbolic acid in a quart of water. Use this wash after a cleansing wash in tepid water. Be careful about feeding too liberally of grain or other heavy feed. In the meantime write your representative in congress—in your case Denver S. Church, Fresno,—and ask for "Diseases of the Horse," published by the department of agriculture. In the chapter treating on diseases of the skin practically all skin diseases are described so you can quickly determine as to which is the best treatment.

Squirrel Poison

Kindly give formula for mixing the squirrel poison referred to in your issue of March 11.—Subscriber, San Marcos.

The regular formula recommended by the federal service, which made so effective a campaign in California, is whole barley, 20 pounds; starch paste, one pint; strychnine sulphate, one ounce; saccharine, one dram. The barley is placed in a receptacle large enough to permit thorough stirring (as a wash tub). One pint of water is then brought to a boil and sufficient laundry starch (about two tablespoons dissolved in a little cold water) is slowly added to form, when well cooked, a paste about the consistency of cream. The strychnine, (first powdered if in crystals) and the saccharine, are now added to the hot starch paste and the mixture well stirred until dissolved. While still hot this is poured over the barley, mixed well, and the whole put aside for several hours before using. Scatter a teaspoon of the poisoned grain along the squirrel trails on hard places near the holes. The poison should not be placed in heaps on the soft mounds at the mouths of the holes. It will probably be found most efficient if scattered early in the morning between the hours of three and seven a. m. Poisoned grain should not be placed in wet weather. Its destructive properties will not deteriorate with age so long as the grain is kept dry and free from moisture.

Interesting and Instructive

We invite the public to see just how Ghirardelli's Chocolate and Cocoa are made in the Ghirardelli Building at the P. P. I. E. The ponderous machines, the pure ingredients, the extreme care as well as the process are fully explained.

Delicious Hot Chocolate made of the famous Ghirardelli's Ground Chocolate served day and evening. Be sure to try a cup.

The Household Department

THE BROWN-SEED BABIES

Asleep in a pretty pink cradle one day,
Swung to and fro on a slender stem,
Some little seed-babies safely lay,
And the soft pink petals sheltered them.
The honey bee hummed a lullaby,
And the wind rocked the cradle as it swept by.

But the pretty pink covers paled in the sun,
They shriveled and drooped beneath its ray.
Then a wild young breeze in boisterous fun
Snatched the brown babies and bore them away.
A rough nurse was he, without any care,
For he tossed them and scattered them everywhere.

Some fell on the river and whirled with its tide
Past island and town to lands afar.
The birds bore some up the green hillside,
Or let them fall where deep forests are.
But the seed-babies were wide awake now,
And wherever they went they knew how to grow.

Their brave little faces looked up to the sky,
Their brave young feet stood fast in the ground;
They took no time to fret or to cry,
But each did his best in the place he found.
Kissed by the sun and bathed by the shower,
Each baby grew to a beautiful flower.

—Kate W. Hamilton.

HOUSEHOLD QUERIES

Bottled Orange Juice

I would like to secure a recipe for bottling and keeping orange juice, to be used for making punch or as a cold drink in summer?—Subscriber, Mecca.

We have no recipe for preserving orange juice, but give below recipes for bottling lemon juice. No doubt orange juice could be prepared and kept in the same manner. Will be glad to hear from subscribers who have had experience in preserving orange juice for later use.

Lemon Syrup

Extract the juice from half a dozen lemons, add a pint of sugar and an ounce of tartaric acid. Pour into a pint of cold water and boil till thin syrup. Put in a sealed jar or bottle, and when needed pour a little of the syrup in a glass and add water and ice.

Lemonade Syrup

Boil together four cups of water and two cups of sugar for five minutes; add the juice of six lemons and the grated rind of one. Bottle in sterilized jars while still boiling, and set away to be diluted with ice water when wanted. The juice of one fresh cut lemon, added at the time of serving, will emphasize the acid taste, but it is not necessary. A teaspoon of lemonade syrup in any fruit beverage is an improvement.

Coffee Cake

I would like a recipe for a quick coffee cake, something I do not have to use yeast in.—Subscriber, Mecca.

The following recipes for "coffee" or breakfast cakes require no yeast:

Dutch Apple Cake

Two cups flour, half teaspoon salt, two teaspoons baking powder, quarter cup butter, one egg, one cup milk (scant), two teaspoons sugar, four sour apples. Sift dry ingredients together and work in shortening, gradually add beaten egg and milk mixed together. Spread one inch thick in pan, slice apples over top and sprinkle with sugar and cinnamon. Bake 30 minutes.

Fruit Rolls

Two cups flour, five teaspoons baking powder (level), half teaspoon salt, two tablespoons sugar, two tablespoons butter, two-thirds cup milk, one-third cup stoned raisins (finely chopped), two tablespoons citron (finely chopped), one-third teaspoon cinnamon.

Mix same as baking powder biscuit. Roll to one-fourth inch thickness, brush over with melted butter, and sprinkle with fruit, sugar and cinnamon. Roll like a jelly roll; cut off pieces three-fourths inch in thickness. Place on buttered tin and bake in hot oven 15 minutes.

Rich Coffee Cake

One cup butter, two cups sugar, four eggs, two tablespoons molasses, one cup cold boiled coffee, three and three-quarters cups flour, five teaspoons baking powder, one teaspoon cinnamon, one-half teaspoon cloves, one-half teaspoon mace, one-half teaspoon allspice, three-quarters cup raisins, seeded and cut in pieces, three-quarters cup currants, one-quarter cup citron, thinly sliced and cut in strips, two tablespoons orange juice.

Measure dry ingredients and mix and sift baking powder and spices with flour. Separate yolks and whites of eggs. Work butter to a cream with wooden spoon, add sugar gradually and continue beating. Add yolks of eggs beaten until light, orange juice, gradually the flour, baking powder and spices sifted together. Add stiffly beaten whites of eggs the last thing, folding in lightly. Bake in deep cake tins.

HELPS FOR THE COOK

Buttering bread or cracker on which cheese is to be toasted improves the flavor.

By first scalding the milk and setting it aside to cool, a baked or broiled custard will be perfectly smooth.

The simplest way to rid brown sugar of lumps is to put it in a bowl over hot water for a few minutes. This softens the sugar so the lumps may be quickly rubbed out.

Practical Culinary Hints

Invaluable Suggestions to the Particular Housewife

Today the busy housewife desires results in everything she does. Sometimes her cooking and baking is not what she would like it to be, notwithstanding the fact that she gives plenty of attention to that important part of household duties. The fault generally lies in the selection of poor ingredients. Use the very best articles and you will gain surprisingly better results. The critical housewife has found that in making cakes, delicate desserts, candy, preserved fruits or anything where considerable sugar is required, she can always obtain good results by using Karo. Candies made with part Karo and part sugar are more creamy, and will keep fresh longer than when sugar only is used. Karo does not have that cloying sweetness of ordinary sugar syrups, but it gives a delicate flavor which is well liked. Marion Harland highly recommends Karo, giving it preference above any other syrup. It is as clear and sweet as honey and is absolutely pure in every sense of the word.

Order a can from your grocer today and see how well and quickly your culinary ability will improve. There are dozens of ways Karo can be used—all of which are fully explained in a little book of recipes which your grocer will give you on request. Ask for it today.

CANNING RECIPES

(Continued from Page 515)

work more rapidly. It is absolutely necessary for the scalded fruit not to be delivered to the peelers until all the previous supply is skinned.

Peeling: Always remove the core first, using a knife with a short, narrow blade, holding it in such a manner that the point will reach near the center of the tomato and slanting the blade at the stem sufficiently to cut out the harder portion of the core, but not enough to cut into and open up the seed cells. If the seed cells are cut, even slightly, a solid pack cannot be made.

Drain off the surplus juice and after filling the can solidly with fruit top it, or press down the tomatoes with a "slop" stick made just large enough to allow for the expansion during the exhaust and process. At this point it is advisable to test the cans and see that they are averaging the standard weight. When properly filled and tipped, wipe the cans, cap, and if cold packing, tip. If exhausting (hot pack), cap and exhaust No. 3 cans 10 minutes, either in water at 212 degrees, or, which is preferable, in a continuous steam exhauster for the same time.

Processing:

For Cold-Packed Tomato Process

No. 2 cans, 12 minutes at 240 degrees; 35 minutes at 212 degrees.

No. 3 cans, 15 minutes at 240 degrees; 40 minutes at 212 degrees.

No. 10 cans, 30 minutes at 240 degrees; 75 minutes at 212 degrees.

For Hot-Packed Tomatoes

No. 2 cans, exhaust 8 minutes at 212 degrees.

No. 3 cans, exhaust 10 minutes at 212 degrees.

No. 10 cans, exhaust 15 minutes at 212 degrees.

For Hot-Packed Tomatoes Process

No. 2 cans, 8 minutes at 240 degrees; 25 minutes at 212 degrees.

No. 3 cans, 10 minutes at 240 degrees; 30 minutes at 212 degrees.

No. 10 cans, 20 minutes at 240 degrees; 60 minutes at 212 degrees.

Tomatoes, Whole

Select firm, solid tomatoes of canhole size, wash carefully and place in No. 3 cans, fill with cold brine (salt, 1 lb., water, 12½ gals.). Cap, tip and process 35 minutes at 212 degrees.

Chicken in Jelly

50 lbs. chicken, 1½ lbs. onion, chopped, ½ ounce bay leaves, ½ ounce whole mace, 1½ lbs. salt, 6 ounces gelatin. Draw and clean the chickens, cut each in 11 pieces, place in kettle and cover with meat jelly, adding the salt and onions and spices in a bag; bring to a boil and simmer until tender; remove the chicken and carefully skin and bone; add the gelatine, which has been soaked in cold water for an hour, to the liquor in the kettle and stir until dissolved, then strain; if the liquid is not clear, clarify with white of egg.

Place the chicken in cans, cover with the liquid, cap, tip and process at 250 degrees:

1 lb. cans, 55 minutes; 2 lb. cans, 65 minutes.

Meat Jelly

Place 50 lbs. calves' feet with 6¼ gals. water in kettle and add 1 lb. sliced onions, 1 lb. sliced carrots, 2 ozs. each of whole black pepper, celery seed and green pot herbs contained in a muslin bag, turn on steam, bring slowly to a boil and simmer 8 hours, adding water to make up loss by evaporation; draw off liquor and strain; when it jells, skim grease from top and return to kettle, adding ½ pint of lemon juice or ½ ounce tartaric acid; turn on steam and heat to 180 degrees. Mix 1 quart white of egg, free from yolk, with an equal bulk of water, crush the egg shells and add thereto; stir this thoroughly in the melted jelly, bring to a boil and strain through flannel bag previously wet with water.

Processed Beans With Pork

Select and clean pea beans of recent growth, place two bushels in a 50-gallon barrel and nearly fill with a solution of 2 lbs. salt in 12½ gallons water; soak 12 hours, then drain off surplus liquid.

Old beans will require a soak of 18 to 24 hours, and usually an increase in process time.

If the cost of the finished product will allow, place one bushel of beans in a 50-gallon barrel, nearly fill with brine and soak 4 to 8 hours; then drain off and replace with fresh brine and soak 4 to 8 hours; draw off this brine and cover beans with fresh water, soak four hours and drain. This removes much of the rank flavor and improves the finished goods. Slice salt pork thinly and place in bottom of cans; ¼ ounce in No. 1 cans, ⅜ ounce in No. 2 cans; ½ ounce in No. 3 cans; then fill cans ⅞ full of the soaked beans and hot dip in—

2½ lbs. salt.

3 lbs. sugar.

½ lb. ground white pepper.

½ pint caramel (burnt sugar coloring).

12½ gallons water.

Cap, tip and process:

No. 1 cans, 2 hours at 240 degrees.

No. 2 cans, 2½ hours at 140 degrees.

No. 3 cans, 3 hours at 240 degrees.

With 212 degrees allow double the time. If a thick sauce is desired, thicken with 2½ to 3½ lbs. corn starch.

CORNSTARCH

The Food Product With a Thousand Uses

There is probably no food product in general use today which serves more purposes in the hands of the up-to-date housekeeper than cornstarch.

She uses it for thickening her gravies and sauces—which is the secret of their rich, creamy consistency, and the smoothness of taste that can be acquired in no other way; she uses it to obtain the fine texture of her bread, biscuits and cakes; for making her pie crust perfect and flaky; for sherbets, ice cream, custards, short cakes, waffles, chocolate eclairs and a thousand and one other things too numerous to mention.

But there is a great difference in cornstarch, and the whole effect desired may be lost by using inferior kinds. No less an authority than Emma Churchman Hewitt, for many years associate editor of the Ladies' Home Journal and other national magazines, says: "I found that the experience of up-to-date housekeepers everywhere was the same as mine—those who had the greatest success with cornstarch recipes depended upon Kingsfords."

This brand is carried by all good grocers everywhere and costs no more than inferior kinds. If you want to obtain the best results insist on Kingsford's. Try it once and you will use it always.

DAISY FLY KILLER placed anywhere, attracts and kills all flies. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 6 sent by express prepaid for $1.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

Rid Your House of Ants

Something Every Woman Should Know in Regard to This Pest

There is no annoyance with which the housewife has to contend more aggravating than ants. They get into the pantry and infest the sugar, jams and other foods in a manner that is almost uncanny.

Women everywhere, therefore, will rejoice to learn that a remedy has been discovered—something that will not only exterminate all the ants in the house, but that will do it quickly. This remedy is the result of long experimenting on the part of a baker and candymaker, who was on the verge of being driven out of business by ants.

The preparation proved so efficacious that it has been put up for general use under the name of Kellogg's Ant Paste. It is provided with a patent rattle cap, which assures the purchaser that it is the original brand, and provides a warning right and day that the contents are poisonous.

Get a bottle of Kellogg's from your druggist today and your ant troubles will be at an end.

The Great Home Builder

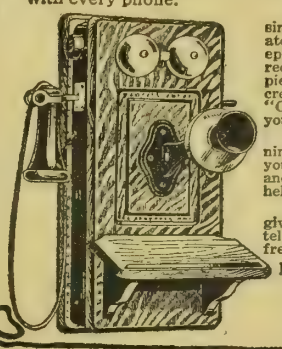
WHAT after all is more worth while than bringing comfort and safety into the home? Think what the telephone has done to tie the country house to the town and the town to the city. Don't be isolated. Get into touch with the voice of the big outside world. Know the prices that rule on farm products. Know about the party at your neighbor's house. Bring to your whole family the safety that comes with the knowledge that in the time of illness or fire the whole community is within call.

Kellogg Telephones

have won their way into homes all over America because of the quality of service they give. Did you know there is a big difference in telephones? There is. Kellogg phones have to undergo an inspection more rigid than other makes. They pass through 37 distinct tests before they leave the factory. That means dollars and cents to you.

As a matter of fact, it is not uncommon for the repairs to cheaper telephones to cost in a few years more than the first cost. Kellogg instruments go on year after year carrying the most delicate sounds perfectly without repairs.

Kellogg Transmitter is guaranteed for five years. A Kellogg lightning protector goes with every phone.



Every part of the instrument is strong, simple and durable. Big, powerful generator that will ring efficiently with 40 telephones on the line. Unbreakable receiver and transmitter mouthpiece. Long life batteries. Secret service push button to ring "Central" without ringing your neighbors.

Let us help you in planning your line. We can tell you how to avoid mistakes and save money. Our expert help costs you nothing.

Oregon Clusters ....12½@

HAY

Under date of April 24, Scott, Magn[er] & Miller say:

Receipts of hay for the past we[ek] were 2989 tons, the preceding we[ek] 3471 tons and the week before 2[...] tons. These receipts have taken ca[re] of all demands on the market and [al]though a fancy car of any variety ha[s] at times sold in excess of our top qu[o]tations, yet the market as a rule [re]mains about the same as heretofore [al]though somewhat of firmness has [de]veloped the latter part of the week c[aus]ing to a rumor of sale for export.

Several lots of hay offered fr[om] country districts have changed ha[nds] during the week and a slightly bet[ter] feeling is to be noted both in coun[try] districts as well as the city marke[t].

The weather has been most favora[ble] and new crop prospects are of the b[est] up to this time. Cutting of new alfa[lfa] on the river as well as interior [dis]tricts has commenced and unless [we] have heavy showers the latter par[t of] this month to damage same, it sho[uld] be of a very good quality.

There is no change in straw to n[ote].

We quote the average wholesale p[rice] of hay in carload lots on today's ma[rket] as follows:

Fancy Wheat Hay (light

Artichokes, boxes, California, 2.00@2.50. Asparagus, boxes, California, 12 large bunches, 75@ 2.00.

THOUGHTLESS

"Your honor," said the arrested chauffeur, "I tried to warn the man, but the horn would not work."

"Then why did you not slacken speed rather than run him down?"

A light seemed to dawn upon the prisoner. "That's one on me. I never thought of that."—Huston Post.

LEGAL QUERIES

(Continued from Page 520)

person claiming the estray shall appear and pay all costs, the estray may be delivered to him. The costs are filing and publication of the notice, 30 cents a day for the care of the horse or other large animal. If nobody appears within the 30 days, taker-up of the animal must notify the constable in writing, who proceeds to sell the animal at public auction, paying his own costs and costs and charges of the party taking the animal up.

Water Right

A and B own a pasture of 1500 acres. C has a homestead in said pasture. He has been getting water here for nearly five years, but since A and B bought the pasture and water three years ago they have forbidden him to use it several times, though he still gets it. Can he hold a water right after this notice or can we fasten the gates and keep him out?—Subscriber, Orange Cove.

To be entirely safe, you should bar your gates for at least a day once a yea:.

Maintaining Canals

Our irrigation company maintains the main canals and claims that the individual owner must keep up any lateral ditches that pass over his land. My neighbor on the east wishes to put a ditch along the front of my place for irrigation purposes. Question is "Will I have to clean and maintain the ditch? Is this matter regulated by state law or does the local water company control? Also if water leaks from the ditch through gopher holes and drowns crops is the water company liable or the man that uses the water or do I have to stand the loss?—Subscriber, Lanare.

You can obviate all your difficulties by making contract with your neighbor wherein provision could be made that your neighbor keep the ditch clean and hold you harmless for any gopher holes. If the irrigation company accepts the ditch which your neighbor put in it might be responsible, but under the provision which you state in your letter, that would be questionable.

Speaking of canners, especially home canners, as we are this week, it is most fitting to call attention to the catalog issued by Henninger & Ayes Mfg. Company of Portland. It gives a list of steam pressure canning outfits manufactured by the concern and in addition has a world of information regarding canning practices. If the Cultivator is mentioned a letter to the concern will secure a copy of this catalog.

"the price of harness and two good mules"

Is the price of the small Samson Sieve-Grip tractor. It will do the work of four to five good horses. It is built of the best crucible steel made in our own crucible foundry. The gears are vanadium steel. Even the Sieve-Grip wheels are high carbon steel and fitted with roller bearings. The eight to ten brake horse-power motor is the counterpart of the same size motor we have built for fifteen years for stationary work. Completely equipped, the whole machine weighs but 3,500 pounds. It is so compact, so nicely balanced and so perfectly constructed that it may be pushed along by hand by one man on smooth surfaces.

Samson quality, Samson reputation, "the strength of Samson in every part," the name we have so carefully protected for fifteen years is built into every part of this little machine.

How often have you heard at Fairs and Traction Shows, "There's the Samson. Isn't that a well-built little machine? See how well protected and strong it is?"

SAMSON SIEVE-GRIP

Our stationary and marine motors from two and one-half to two hundred horse power are in use over the entire Coast. Our centrifugal pumps, some with 50,000 gallons a minute capacity, are found wherever you go in the West. Our tractors, the first of which (built over thirteen years ago) placed us among the pioneers of the industry, have always delivered the best of service.

We now offer you the small Samson tractor, designed for the farmer or grower with either a small or large acreage and sold at a price within reach. Yet the price is not so small that we must slight or scrimp any necessary part. From steering wheel to transmission we have given everything the needed strength. And, while small tractors have been built before and are now built, the Samson comes to you with a reputation back of it for promises always fulfilled.

SIZE AND SPECIFICATIONS

Forty inches in height, 10 feet long and 1¾ tons in weight, the small Samson Sieve-Grip marks a new era in tractor building. It is the long-sought-for small tractor. It will do the work of the four or five animals on the average farm or orchard, at a first cost no greater than the two or three horses and their equipment usually owned. And in maintenance, labor and operating cost no comparison exists. The small Samson uses but one gallon of distillate per hour. At 7 cents a gallon this is an average daily fuel cost of 70c. But one quart of lubricating oil is needed in a day and one man can operate tractor and plows. Depreciation is very light. The simple and durable construction and the added fact that the tractor is small and the parts consequently inexpensive places depreciation at its lowest point.

THE SIEVE-GRIP WHEEL

The Samson Sieve-Grip wheel is patented and owned exclusively by us. It is the result of long and painstaking effort to provide good traction. It is a success. It can't pack any soil, it does not slip. It will operate on any soil whenever plowing or cultivating is practical. For traveling over asphalt or valuable roads removable road bands are provided. They can be attached or removed in five minutes. There is no complication, no up-keep cost, nothing to wear out, nothing to break down. The whole wheel is a single high carbon steel casting. It is dependable and economical, as a small tractor should be. We guarantee it to do all that we claim for it and to do **your** work to **your** satisfaction.

SEND FOR BOOKLET

We want you to know more about the small Samson Sieve-Grip tractor. You should know more about it. We have a new catalogue giving a complete and minute description of the entire mechanical construction of the machine. Operating costs, factory facilities, responsibility of the manufacturers, are all explained in detail. Get it now. Sign the coupon and send it in. Tell us, too, how many acres you are farming and what you grow. It will help us to give you the right information. Send it now!

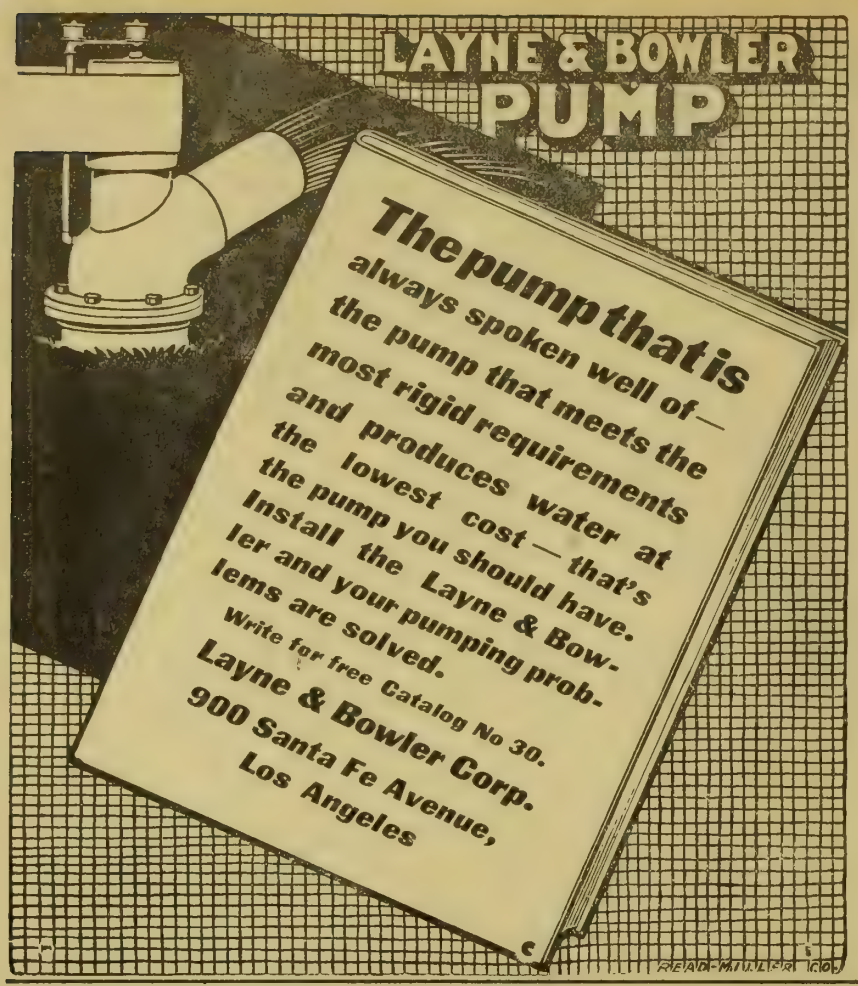
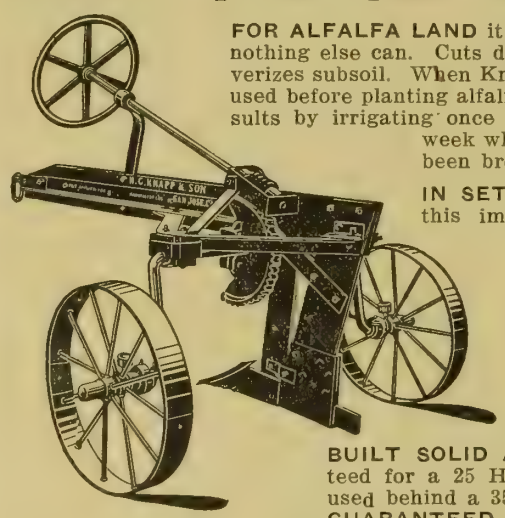
Corn and Hogs in California

Sacramento Valley does produce some, as do various other portions of California. In fact, production per acre in California exceeds that of the older corn states. The gentleman holding the other on his shoulder is Eugene Grubb, potato specialist and all round farm expert. See W. S. Guilford's article on next page.



Knapp's Sub-Soiler and Ditcher

Breaks Up Hardpan and Plowpan



FOR ALFALFA LAND it makes ready the soil as nothing else can. Cuts down deep and fairly pulverizes subsoil. When Knapp's Subsoiler has been used before planting alfalfa, you can get better results by irrigating once in 60 days than once a week where the hardpan has not been broken up.

IN SETTING FRUIT TREES—this implement makes digging the holes the easiest of tasks. Where trees are already planted it breaks up the plow-pan and allows the moisture to get down to the roots. Breaks a strip of ground from 3 to 4 feet wide.

BUILT SOLID AND STRONG—Guaranteed for a 25 H. P. pull—and has been used behind a 35 H. P. machine.

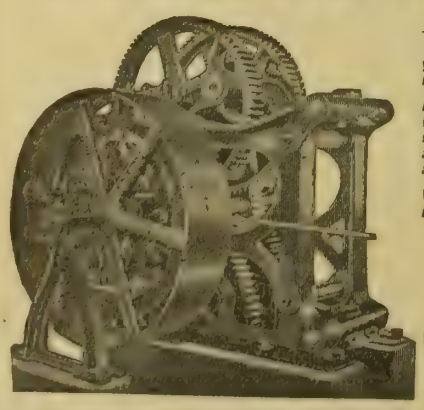
GUARANTEED BY KNAPP—and that means a lot. Knapp's plows are known all over the Pacific Coast, wherever good plows are used.

DITCHER ATTACHMENT—With this attachment you can ditch as you sub-soil, making at ditch 2 feet deep and 4 feet wide.

WRITE FOR MORE PARTICULARS—Ask us anything you want to know about the sub-soiler and ditcher—and for names of those who are using it.

H. G. Knapp & Son, 1022 S. FIRST STREET SAN JOSE, CAL.

Pomona Deep Well Pumps



—built and sold in California for over 12 years. Hundreds of buyers will tell you they are always reliable and economical.

For deep lifts, as well as shallow lifts, combined with high heads above surface and through long pipe lines. No auxiliary pump needed for forcing water above the surface.

Hogs and Corn

W. S. Guilford Writes for Cultivator Readers of Conditions Which Are Favorable to Swine Production in the Sacramento Valley

AN Illinois farmer who spent most of the winter in the Sacramento Valley, and who was a bit disappointed that there were not more roses and sunshine (he had pictured California as mostly these two things), would sometimes reluctantly state that California might be all right if Indian corn could be grown here. When told that it can and is being grown every year, and that it has been grown all the years that California has been known, he would peevishly come back with the first prize foolish question of every new country, "Well, if it can be grown, why don't people grow more of it?" The answer to this is, "Why are there not more prunes grown, and why is not every acre of land in the valley irrigated, and why are there not ten million people here." His question can only be properly answered with another perfectly good question.

It is really remarkable that there are so many people who do not think that Indian corn can be grown successfully in the Sacramento Valley and many more who think that without corn the hog business is not on the basis it should be. Hogs can be profitably grown with alfalfa and barley, Egyptian corn or any other grain, but they can also be finished on Indian corn if the people who own thousands of acres of the best lands in the valley want to grow it. But some there are who who will scarcely believe that corn can be grown even when they see the fields.

In the course of the conversation with our eastern friend I made the remark that I did not doubt I could go within two miles of a farm in the Sacramento Valley on which crops of Indian corn of from 60 to 90 bushels per acre have been grown on the same piece of land for six or seven years and ask some citizen who has been there all that time if this is much of a corn country and that the answer would be an emphatic "no." In a few days I was in this neighborhood, and recalling the conversation did ask this question and received the expected negative opinion without hesitation on the part of the person addressed.

And yet corn and hogs have been among the principal sources of revenue on this place ever since it has been developed. The photograph on cover page was taken on the farm referred to.

Right now is the time to be getting some corn planted. I know some that is three inches high now (April 22). Some prefer to plant later and others do plant as late as in July, and it all makes mature corn.

There is no place in the country where corn can be grown so easily as in California, and no place where it can be made into pork so cheaply. With alfalfa pasture and access to the corn fields, a part at a time so as to clean it up as they go, hogs will "hog down" and harvest corn from the time it gets ripe until the rains have made the soil so wet that it is unwise to permit stock to tramp over it. There are some who claim that hogs will waste too much Egyptian corn if it is fed in that way, yet these same farmers will frequently harvest the corn, thresh it, and feed it out to hogs in muddy pens during the winter with much more waste and under far worse conditions than could ever prevail in the open field. I know of one ranch where corn was fed both ways during the past season, and the result was so favorable to hogging off the corn in the field that the plan for this year is to let the hogs harvest all of it this way except enough to carry through the winter rainy season.

We will wake up some day to find that a "prophet" has discovered that the Sacramento Valley is a great corn and hog country. And then, perhaps, some of those who would now dispute it will rise up and say "We always knew it."

University Farm Picnic

Annual Event Which Attracts Thousands to the University Farm at Davis. More Generally Attended Than Any Preceding Year. Live Stock Parades and Exhibits of Farm Stock. By Cultivator Special Contributor

ANOTHER success was scored by those in charge of the affairs of the Davis farm of the University of California, the event being the annual picnic.

The people of central and northern California, particularly those within easy automobile distance from the Davis Farm, look forward with a great deal of interest and pleasure to this big "get together" event, and each year brings about an increase in the importance of the function. Various estimates placed the attendance this year at from 2500 to 5000.

A feature of the pricnic this year was the live stock parade and other events that were entirely in charge of the students. They fitted the stock, made and decorated the floats, invented and perfected the clown costumes and other comic features, and everything was a grand success. All breeds of live stock and poultry, feeding devices, horticultural practice and other vital agricultural problems were demonstrated in a very clever and attractive way. The university herds and flocks are increasing in number and quality every year and are now a credit to the animal husbandry department and the state.

Accommodations in the open-air amphitheater on the bank of Putah Creek were inadequate for the accommodation of those who attended the speaking exercises. Jiro Harada, commissioner for Japan at the Panama-Pacific International Exposition, delivered an address in which be commended California for its support of the agricultural college and urged all possible assistance to the producers on the land because it is upon the production of crops that the success and perpetuation of any nation depends. On behalf of his people now in California he asked that they be helped to work for the welfare of the state and the nation. The ecomic and trade relations between Japan and the United States must always be friendly, said Hirada. He was very much interested in the live stock department and dictated copious notes to his secretary from the statements made concerning the different breeds, feeding, etc., by Professor Gordon H. True, in charge of this department.

Another very able address was delivered by Mrs. Adda F. Howie, one of the most remarkable women and one of the ablest farmers in America today. She breeds Jersey cattle at her home farm in Wisconsin, has been connected with farmers' institutes in various states for years and is now in charge of the Wisconsin building at the Panama-Pacific Exposition. She is also one of the board of directors of woman's work at the fair. Mrs. Howie urged higher ideals and better and more attractive homes for American farms.

People began to arrive at the farm early in the morning and showed great interest in the inspection of the stock, buildings and appliances, in the speaking, sports and music and other entertainment until the close of the shirt waist dance in the evening.

Proud parents of the students were in evidence everywhere, and they must have been more than pleased to find their "young hopefuls" busy with practical affairs, not only learning how to handle farm operations but to have a hand in the management of things.

They are an earnest, energetic, thoughtful lot, these lads at the Davis farm, and are destined to be a great influence for agricultural betterment and advancement in California during the next two or three decades.

The hog barn was thronged with visitors all day long and Professor J. I. Thompson and his assistants were busy answering questions and giving helpful advice about breeds, feeds and management. There are over 200 hogs in the herd now, Berkshire, Poland-China, Duroc-Jersey, Chester-White, Yorkshire and Tamworth. The average number of pigs per litter this year has been nine. One Duroc-Jersey sow from the Slocum herd on the Sacramento Valley Irrigation Project at Willows farrowed 17 and raised 12 good pigs.

There are good representatives of the mutton and wool breeds of sheep—Shropshire, Southdown, Oxford, Hampshire, Cotswold and Merino. One Cotswold ram was declared to be the best individual of the breed in America by the man who judged him at Portland and who had also judged the breed at the International stock show at Chicago. A lot of 100 grade sheep are being fed various combinations of alfalfa silage and grain, and some valuable data should be available from these experiments before long. The animal husbandry department is to be congratulated on having a cheap, practical and sensible barn or open shed for this sheep experiment, one that is adapted to California conditions, is within the means of any sheep man and is all that is required or warranted for any one. More sheep are

ORANGE GROWERS' AND RETAILERS' PRICES

Written for California Cultivator
By J. G. Berneike

A CAREFUL analysis of retailers' prices (as per schedule in Cultivator of April 22), and comparison with prices received by orange growers here reveals some remarkable facts that should become fruitful not only of thought but of action.

A grower said to me a few days ago: "I have received 22 cents net per packed box for my navels." By this he did not mean 22 cents net profit over and above expenses. He meant that he had received 22 cents for producing a packed box of fine navel oranges. Since the association packing houses are extremely careful in culling, and this spring culled out as high as 25 per cent, it is evident that his "packed" box was superior fruit, and no culls. The retailer in New London, Ohio, received from the consumer from $2.66 to $3.60 per box. Out of this amount there came back to the grower the magnificent sum of 22 cents. This case is typical, at least of every grower who was in the same association pool with him. Other pools may have received more or less. And because his case is typical it is worthy of careful analysis.

This grower received from 6 to 8½ per cent of the money paid by the consumer. The balance of 92 to 94 per cent paid for picking, packing, shipping by freight and express, transfers, a chain of middlemen, the grocer's expense and a profit to him of six to seven cents a dozen. How much did the grower get per dozen for producing these oranges?

Grower received per dozen: Size 324, 22-27 cents; size 216, 1 2-9 cents; size 150, 1 5-6 cents; size 126, about 2 cents; size 80, about 3 cents. Consumer paid: Size 324, 12 cents; size 216, 20 cents; size 150, 25 cents; size 126, 30 cents; size 80, 40 cents.

It will be admitted that the retail price was not prohibitive. Customers probably thought: "Oranges are cheap." Did any one of them in the least suspect that the producer received only about four-fifths of one cent for the dozen for which he paid 12 cents; less than two cents for the 25 cents a dozen size; only 3 3-10 cents for the 40 cents a dozen? How long can the orange industry of California last when the grower does not make expenses? Has he a kick coming? Yes, he will kick over the traces soon. He does not propose to be left stranded and starving on the rocks. The California orange grower is too intelligent to play the part of "the man with the hoe." He will not weep silent tears. He will demand that the cooperative machinery which he has created for his good shall now serve him another good turn in abolishing the army of middlemen that devour him. He will replace 10,000 of them by 1000 that will do his bidding. The 9000 which are only leeches can go to work thereafter.

Nor will the grower longer accept the shallow explanations, viz., tariff, decay, aftermath of frosted fruit of three years ago. He has counter questions to ask these philosophers, i. e., does the tariff change every few weeks or months? Does it account for the recent better prices? As to decay: Do we not cull more closely and pick and pack more carefully than ever before? As to frosted fruit aftermath: Has not our fruit been of superior quality the last two years, and is the consumer so slow in finding it out? Does the thought of decay or frost ebb and flow from month to month?

But well may I be asked: "If you blame the middleman, is he not also a steady, not a fluctuating quantity, as much so as the tariff?" True, annotating the Scripture phrase: "The poor (the middlemen) ye have always with you." Yet he is after all of variable quality. It is at least not unreasonable to suppose that occasionally he puts his ear to the ground to learn if the rumble of the earthquake that will bury him is growing more ominous in volume.

With an improvement in prices the grower may forget for a while that the permanent evil is the unnecessary middleman, and the permanent remedy is the abolishment of him. The grower will become fully aroused one of these days and demand in no uncertain tones the overthrow of a system which is robbing him.

LEAF GUMMING OF CITRUS TREES

Written for California Cultivator
By J. Eliot Coit

Judging from the unusually large number of specimens being sent in, leaf-gumming is for some reason particularly common this year. The photograph shows an orange leaf with the reddish brown spots so typical of this trouble. The spots or streaks nearly always occur on the under side of the leaf and near the outer edge. To the uninitiated these red spots or pustules appear as scale insects or as a rust of some sort. As a matter of fact, they are nothing more than blisters between the cuticle or outermost

Reddish Brown Gum Blisters on Underside of Lemon Leaf.

layer of cells and the spongy tissue beneath. These blisters are filled with gum which gives them their reddish brown color.

Leaf gumming was until recently thought to be due exclusively to sunburn brought about in any one of several ways. The writer has recently discovered, however, that a light hoar-frost may have the same effect.

When citrus trees are allowed to get too dry the leaves will curl and expose the undersides to the sun. Often an extra vigorous shoot will produce such wide heavy leaves that they will lop over and expose the lower side. Occasionally in very hot situations small blisters will form on the upper surfaces of the leaves. Sometimes when irrigation takes place on a very hot day the reflection of the sun from a pool of water close beside the tree may strike the undersides of a few leaves and acting together with the sun from above, cause blisters.

It is common for citrus trees to put out late in the fall a few vigorous

shoots bearing large, limber leaves which lop over. These may go into winter insufficiently hardened, and when an otherwise harmless white hoar-frost falls on the undersides of these tender leaves, typical gum blisters are formed.

Leaf gumming does very little or no harm and may safely be ignored. It is not a contagious disease or insect pest. It never affects more than a very few leaves on any one tree. It may or may not indicate a lack of care in irrigation at some previous time.

CORRECTION

On page 486 of the issue of the Cultivator of April 22, in giving the formula copied from label on containers of cyanide of potassium, an error appeared in that one extra figure was allowed to remain in referring to "Inert substance." The line read "Inert substance 4.0%—22.0%. It should have read "Inert substance 4.0%—2.0%."

FROST AND FROST PROTECTION

We have received from the weather bureau of the United States department of agriculture a reprint of "Papers on Frost and Frost Protection in the United States." The original articles appeared in the Monthly Weather Review.

These are articles by Prof. W. J. Humphreys, Dr. Ford A. Carpenter, Local Forecaster, Los Angeles; J. W. Garthwaite, Corona; J. Warren Smith, Columbus, Ohio; Chief of Bureau Charles F. Marvin, Charles F. Von Herrmann, Atlanta, Ga.; J. F. Voorhees, Knoxville, Tennessee; Alfred H. Thiesen, Salt Lake City; E. A. Beals, Portland, Oregon; A. J. Mitchell, Jacksonville, Florida; R. R. Briggs, Phoenix, Arizona; M. Sprague, Houston, Texas, and Joseph Cline, Dallas, Texas.

The articles make up a very exhaustive treatise on many of the scientific questions connected with frost fighting.

GAS ENGINE BOOK

Harper's "Gasoline Engine Book, How the Engine Is Made, How to Use it at Home, In Boats and Vehicles, and Elsewhere, and How to Keep it in Order," by A. Hyatt Verrill, published by Harper Brothers, $1.00 net.

This is one of the Harper series of "New Books for Younger Readers," and we imagine the boy who has seen or who has access to a gasoline engine, an automobile, or any mechanism driven by gasoline will revel in this book. It will surely be a case for midnight oil for it is intensely interesting.

"The modern gas motor is the simplest, strongest, and most compact power-producing device known to man, and yet not one person in a thousand has but a vague idea of its principles or operation.

"The purpose of this book is to serve as a simple, practical, and complete guide for all those who own, use, or operate gas and gasoline motors. In its preparation every effort has been made to do away with technical terms and names and to adapt the book to the requirements of those who possess little or no knowledge of engineering or mechanics. While intended primarily for boys it will prove of equal value for older readers as it is more complete and exhaustive than any book on the subject hitherto published, aside from strictly technical works. The author, who has had many years' experience with gasoline motors of all types, has substituted facts for theories and has included a vast amount of useful information, handy hints, and valuable suggestions which have proved of actual practical value in connection with gas-engine work."

There are five parts to the book, Part I touching upon the gas engine, what it is, four-cycle motors, keeping motors cool, what makes power, electrical equipment. Part II touches upon motor anatomy, single and multiple cylinder motors, special forms, size and power; Part III upon marine and stationary motors; Part IV, the vehicle motor, automobiles, clutches, transmissions, etc., and motorcycles.

Perhaps the best of all is Part V, which has to do with troubles and repairs, how to prevent, tools and supplies.

It is a well printed, well bound book of nearly 300 pages.

Here Are the Facts

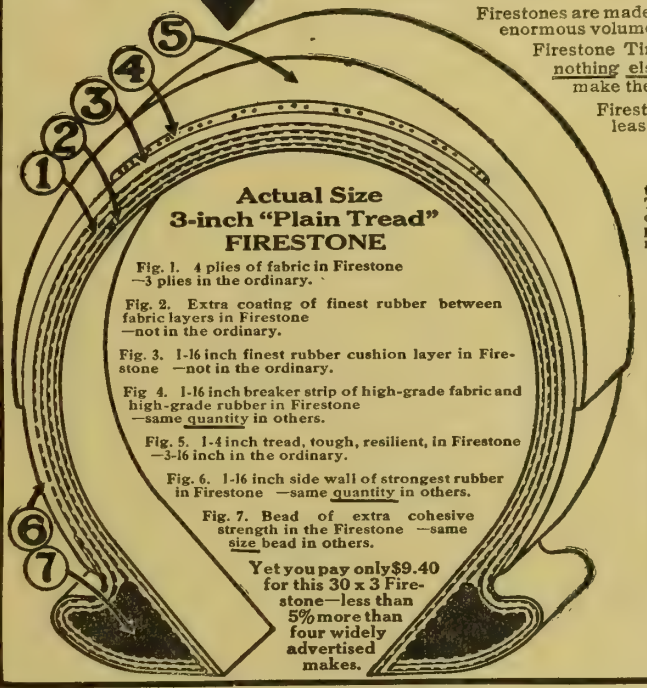
The high quality and low price which have made Firestone Tires so widely popular — are here shown in plain black and white.

Here Are the Figures

Proof—the section showing actual goods built into the tire, and the price list showing that Firestones cost no more than ordinary tires.

The Firestone "extras" built into every tire are not only the result of experience and "know-how"—they mean plain, straightforward "good-measure" building. Not only the world's finest rubber but more of it than in any other. Not only the highest-grade fabric but more plies of fabric. Count them—we show the proof in this 3-inch section. And there is the same relative value in all sizes of Firestones.

Firestone



Actual Size 3-inch "Plain Tread" FIRESTONE

Fig. 1. 4 plies of fabric in Firestone —3 plies in the ordinary.

Fig. 2. Extra coating of finest rubber between fabric layers in Firestone —not in the ordinary.

Fig. 3. 1-16 inch finest rubber cushion layer in Firestone —not in the ordinary.

Fig 4. 1-16 inch breaker strip of high-grade fabric and high-grade rubber in Firestone —same quantity in others.

Fig. 5. 1-4 inch tread, tough, resilient, in Firestone —3-16 inch in the ordinary.

Fig. 6. 1-16 inch side wall of strongest rubber in Firestone —same quantity in others.

Fig. 7. Bead of extra cohesive strength in the Firestone —same size bead in others.

Yet you pay only $9.40 for this 30 x 3 Firestone—less than 5% more than four widely advertised makes.

Then note the price! The low figures may puzzle you (considering the "extras") until you know these facts—

Firestones are made in America's Largest Exclusive Tire Factory. This enormous volume cuts cost of production and reduces the price to you.

Firestone Tires and Tubes are made by specialists who make nothing else. This means that they make better tires and make them at a lower cost—another saving for you.

Firestone marketing methods get the tires to you with least handling and expense—another saving for you.

Free Firestone Offer

To the car-owner sending the name of his dealer and the make of tires, we will send free, a fine waterproof Tube Bag. Just the thing to keep your tubes in prime condition. Ask also for new book on the "Care and Repair of Tires" No. 36. Write today. There is a dealer near you who will supply you.

Study the Facts and the Figures—It Won't Take You Long to Decide on Firestones.

NO CLIMBING OF TOWERS IN OURS

Every bearing is constantly flooded with oil. Two quarts of oil in the gear case of the 8-foot Auto-oiled Aermotor will keep the gears and every bearing flooded with oil for a year or more. With its duplicate gears and two pitmen lifting the load straight up it is unbreakable. It runs in a breath of air. The galvanized helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. If you are tired of climbing a windmill tower; if you are tired of having repairs and having them put on; if you are tired of waiting for a big wind, let us furnish you this self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. Write

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

Deciduous Fruits

CHERRIES RIPE

ORANGE growers have learned the lesson that green fruit injures the market and causes more loss than is made up by the high prices which the earlier shipped fruits often bring. Grape growers are learning the lesson, in fact, it has been taught to them so severely that we may say the lesson is well learned, yet there is always a temptation to secure exceptionally long prices for out-of-season fruits, so the cantaloupe grower—even the strawberry and small fruit man— and now the cherry grower, has attempted to crowd the season. A year ago we received from a Kansas City subscriber, Mr. Albert Young, an attorney, a communication touching upon green cherries offered in that market. Now comes Mr. Young with another letter, as follows:

"I had occasion about this time last year to write you in regard to the shipment of green cherries from California to this market. Some seemed rather resentful that objections should be made to such practices. Now here comes along the same small, unripe cherry from "the Musser Ranch," Vacaville, at least that was marked on the box which was exhibited in the window of a prominent grocery store today. Several persons stopped to gaze at this fruit and I heard two women who stopped say 'Those are green, don't buy them.'

"It is a disgrace to the fruit interests and to the consumers that such things are allowed and that growers are so greedy that they cannot wait for the ripening of their fruit. Those cherries if ripe would be almost twice the size and luscious. As is usual, there will be cherries from this time on from California in this market. but there will not be a ripe one for 30 days. I know that from what happens every year. People buy them at 60 cents a pound and of course are disgusted. If the United States government can stop the shipment of green oranges, why not green cherries?"

We wished to trace this to see where the blame belonged so we wrote to Mr. Millard Sharpe, a large fruit grower of Vacaville, and asked for his opinion as to where these green cherries came from. Mr. Sharpe is vitally interested in the reputation of Vacaville cherries and we knew he would give the matter immediate attention. We are glad to see that there is no such ranch in the Vaca Valley as the Musser ranch to which Mr. Young refers. However, this is a matter that perhaps should call for full investigation. Mr. Sharpe writes:

"The copy of the letter of Mr. Albert Young received and in respect to his complaint relating to California green cherries I will state that I never have heard of a ranch here by the name of 'Musser Ranch' but in order to be certain I called on all of the shipping firms here and the nearest I could get to the name is the L. J. Mowers Ranch from which a box of Belle d' Orleans was shipped about that date and consigned to Kansas City. The Belle d' Orleans is a small, sweet, light colored cherry and it may be that owing to their very light color Mr. Young presumed them to be green.

"It is a little difficult to understand just what he means by a green cherry for no cherry can be shipped until fully colored, in which condition it is edible, although, as all horticulturists know, with the exception of a few varieties no fruit reaches its highest development of flavor unless allowed to ripen fully on the tree and at that stage it would be unfit for Eastern shipment. If his complaint had been in relation to some other varieties of fruits I would not be surprised as there is no doubt in my mind that a great deal of diciduous fruit is shipped too green but if Mr. Young only knew the quandary that a fruit grower is in during shipping season, he would be more inclined to sympathize than to criticize, for it seems impossible to know at just what stage of ripeness to ship. For example, a grower will ship a variety of plum which you are sure is too green and will not bring the price of the freight and you will hold yours, thinking it will reach the consumer at just the proper degree of ripeness. He may get a fancy price and you may be the one who pays the freight or it may happen as you thought it would. Then again, a great many men who are growing fruit do not know when it is ready to ship, especially in the newer districts, and for Mr. Young's benefit you may tell him that our last legislature has passed a law which if properly enforced by competent inspectors at every shipping point may do away with a great deal of the green fruit shipments, dishonest packs, etc., at least we sincerely hope so.

"Another point in regard to cherries: Growers sometimes pick them a little closer than they should, owing to the danger of rain in April which will ruin ripe cherries for shipment. Also some of the earlier varieties are naturally very soft and must be shipped a little harder, though fully colored, than some of the later kinds which are firm when fully ripe.

"One of the leading commission houses here is going to take this matter up with the Kansas City agent and if this criticism is just the matter must be remedied.

"As to the greediness of growers, I would say the remedy for green fruit lies directly in the consumer's hands. Let him study the different brands and refuse to buy any except what he knows to be first class fruit. This would soon bring 'the greedy grower' to time. For in a land with as mixed a population as California, there is bound to be green fruit shipped, especially when the first shipped brings the money, but as I said before the standardization law may remedy this. I cannot see where Mr. Young is justified in criticizing the cherries though my knowledge is confined to Vaca Valley alone. However we are glad to get just criticism for through it we are enabled to better conditions."

EIGHT NUTS IN A CLUSTER

Mr. William Cooper, who has a walnut ranch in the El Monte section, exhibited a twig from one of his walnut trees containing a cluster of eight nuts. He says it was one of many clusters on the same tree, nearly every tip of which has six and seven to eight nuts. This must be an exceptional tree and we trust it is an indication of an exceptionally large crop this year for if the war continues it is possible the French will need to conserve all their food within their own country and in that case it is our duty to supply America with nuts.

OTHERS HAVE NOTICED IT

Two negro men came up to the outskirts of a crowd where Senator Bailey was making a campaign speech. After listening to the speech for about ten minutes, one of them turned to his companion and asked:

"Who am dat man, Sambo?"

"Ah don' know what his name am," Sambo replied, "but he certainly do recommen' hisself mos' highly."—E. V. Cole.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Peach Trees From Pits

If one plants Muir peach pits can he expect Muir peaches or would they run back to some other stock?—Subscriber, Kenwood.

There might be some which would be equal to the tree from which the pits were taken. However, as a rough guess we would say that 99 out of each 100 would be inferior, or at least no better, while the 100th might be choice stock. The only way to secure fruit of known quality is to bud or graft and that is the invariable custom with commercial orchards.

Silage for Hogs

Regarding silage for hogs, in answer to a query along this line we recently stated: "We do not know of silage ever being provided as a part of the ration of hogs on an exclusive hog farm." We now have a communication from a subscriber calling attention to the fact that there is a large hog farm at Winters with two 14x36 foot silos built exclusively for feeding hogs. These silos were filled with green silage. We hope to have information as to the results of feeding silage to hogs in an early issue.

San Jose Scale

When spraying for San Jose scale, can one be certain he has killed them? How may he know it as they remain on the tree?—Subscriber, Vacaville.

If the spraying is done with lime sulphur solution at the rate of about 1 to 10 when the trees are dormant reasonably sure work is accomplished. The best way is to spray so thoroughly that no examination is necessary. However, after two or three weeks if the weather has been warm and dry the least touch with a pin or fine knife point should cause the scale to flake up and fly away light as a feather. The color of the dead scale is also somewhat darker than that of live scale. When the scale are alive they are reasonably sure to be soft and more or less "juicy."

Poisoned Hens

In the last few weeks we have lost four hens. They seem to have a diarrhoea, their combs turn black and they live about two days after I notice they are sick. They run loose on ranch and pick up all their living around stable and orchard. Do not know of anything they pick up that causes the trouble. An answer would be greatly appreciated.—Subscriber, Ducor.

If your hens are required to pick up all their living about the place it is more than likely they have picked up something which would not be classed as clean, wholesome food. Foul drinking water, putrid meat or decaying food of any sort might induce dysentery such as you describe. So might the eating of paint skins, lye, unslaked lime, salt and the arsenic and copper which are used in spraying mixtures. Suppose you confine them for a few days in a clean pen. Keep a hopper of dry mash before them, give cut alfalfa or other greens at noon and a feed of grain at night. Above all give them clean, fresh water at least once a day. As soon as you are satisfied that their range is free from any of the poisons suggested, let them out, but see that they have grain at night and mash where they can find it, and always, clean water. If they have good range, they will not eat much when they come in at night, but they should have the opportunity to eat if they wish.—J. A. K.

Canker

The hen with the cheese-like patches under her tongue and in her throat has what is generally called canker, but it is so closely allied to roup that it is often imposible to distinguish between them. If the trouble is purely local it can probably be cured by swabbing the patches with peroxide of hydrogen or with undiluted creolin. If there is a roupy condition as well you will not cure her so easily, but there is little you can do save to put her in a warm, sunny coop and swab the patches with some good, strong antiseptic, such as hydrogen peroxide, a permanganate of potash solution (16 grains permanganate to half pint water), or a boric-acid-borax solution consisting of 1½ ounces boric acid and one ounce powdered borax dissolved in a quart of water and applied warm. Examine the scratching litter for mold which is one of the commonest causes of canker.

Those roosters which are too fat inside and too thin outside have had too little exercise and a too-fattening ration. Barley is a good growing feed when used with other things but too fattening when used alone. The fact that the birds are under weight, however, is not attributable especially to their feed but rather to the parent stock. When breeding stock is under weight it is very difficult to bring their offspring up to proper weight. The hens are said to have the most important influence on the size of their young, but breeding from a male that is noticeably small has the same effect. Of course feed has its part. Birds that are to attain proper size must have bone meal, oats and other feeds for making frame, for you cannot build up a heavy bird on a light frame except by putting on fat. If you study your breeding stock and the ration your birds have had you will probably see why your cockerels are small.

Roosting too young or on crowded perches is often blamed for crooked breastbones, but they are without doubt congenital in many cases.

Cockerels are broilers at from 1½ to 2½ pounds (though most dealers do not care for them under two pounds) and fryers from 2½ to 3½ pounds.—J. A. K.

Sheep for Mutton

Am feeding cows on silage and alfalfa hay. Expect to sell cows and keep sheep. About how much of this ration fed the cows will it take to keep a sheep one year? How many sheep can be kept on the same amount of feed that it takes for a cow? Will sheep do well if confined in a corral? What is the best breed of sheep for mutton?—Subscriber, Escondido.

It is generally considered that ten head of sheep can be kept on the same feed as one cow. This is on the basis of a cow eating 30 pounds of hay with silage and perhaps some grain in addition, as against 10 sheep eating three pounds of hay and some other feed in addition.

Sheep can be kept in a corral if it is kept clean, but it is better if they have the range of some pasture.

The carcasses of the individuals of all of the breeds of sheep are sold for mutton, and the classification of the breeds is made on the character of wool produced. The fine wool breeds are the different sorts of Merinos, including the Rambouillet. These have been bred for generations with heavy fleeces of fine wool as the first consideration, although some individuals have good carcasses and a large part of the mutton produced on the ranges is from animals having more or less Merino blood. The long wool breeds. Lincoln, Leicester and Cotswold, are big sheep that produce heavy fleeces of long wool and a heavy fat carcass. The medium wool breeds, Shropshire, Hampshire, Southdown, Oxford, Cheviot, Dorset and Suffolk, are

(Continued on page 547)

The Portable Rake and Stacker

Here is a machine that you cannot afford to do without. A Buck rake and stacker combined. Rake up the hay, drive to the stack and hoist the load right onto the stack without any loss of time. Saves labor, saves time and saves first cost of equipment. A pronounced success. Another carload just received and partly sold. Write for completely illustrated circular or call and see it.

THE SCHMEISER PORTABLE AUTOMATIC DERRICK

THE HAY STACKER THAT SAVES TIME, WORK AND MONEY

This derrick will handle hay, loose or baled, in the easiest, quickest and most economical manner known. It is always ready, is portable and can be moved from place to place as easily as a farm wagon. With it three men can do the same amount of work as nine men by hand. Has great lifting capacity and is unequalled for hoisting machinery, timbers, or heavy loads of any kind.

WRITE US TODAY and we will send you descriptive and illustrated literature. The Schmeiser Portable Automatic Derrick is not an experiment. It is the result of 25 years of actual experience gained in farming. It is being used with great success all over the Pacific Coast. Write us NOW for full details explaining just what it can do and how it can save you time, work and money. Address

Small Fruits Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

IF ONE requires any quantity of vegetables it is best to plant these in succession throughout the season. Of course, with some of the varieties one planting will be sufficent, especially those of the late maturing classes such as celery, Cabbage and tomatoes. Reports are pouring in that the late cold spell has greatly injured early planted vegetables, especially those of the tender varieties, including melons, pumpkins, squash, cucumbers, egg plant, peppers, celery, etc. These may be replanted at once.

This is the best month to plant all classes of beans. If beans already in have been in any manner affected by the cold it would be advisable to plow over and re-seed to insure strong, thrifty plants and secure best results. Crops now growing satisfactorily should be carefully watched, thinned if necessary, thoroughly cultivated and hoed.

Now is the season to plant onions, leeks, celery, egg plant, peppers and casaba melons. We have a number of new varieties of casabas on the market for the first time this season and for those who have space we would recommend a trial of these various sorts. The soil for melons should be very deeply plowed and thoroughly harrowed and made as soft and mellow as possible, especially where irrigation is not practiced during the summer. The best melons, as is well known, are grown without irrigation, and to make a success of them it is necessary that the soil be deeply plowed and thoroughly worked up to hold moisture.

Insects are causing growers a good deal of concern this season, the green fly or aphis particularly. It is a constant battle to keep this pest under check. The most successful preparation for its control is tobacco extract, with the addition of a small quantity of whaleoil sop, about one pound to ten gallons of water.

Potatoes may be planted up until June or July. Those planted now will ripen a little bit early, probably the last of this month will be the ideal time for planting. The later planted potatoes may be held through the winter while the earlier planted ones will not keep when stored.

The splendid rains will no doubt induce large plantings of corn, pumpkins and like crops. For these it is necessary to put the soil in best shape to hold the moisture.

GARDENING IN CALIFORNIA

"Gardening in California, Landscape and Flower," by John McLaren, Superintendent of Golden Gate park, San Francisco, published by A. M. Robertson, San Francisco, $3.75 net. This is a revision of the 1908 edition and touches gardening from a California standpoint and from the standpoint of the landscape architect.

McLaren's great work at Golden Gate park and in connection with the Panama Pacific International Exposition is such that it gives additional value to this work he has written. There are 22 chapters in the book, touching upon location and site for house and garden, planning grounds, preparation of ground, roads and walks, planting, lawns, trees and shrubs, climbers and twiners, bulbous plants, palms, ferns, bamboos and grasses, bedding plants, water garden, parlor gardening, conservatory, diseases and insects, ending with a calendar of operations. This calendar gives dates for both open garden and greenhouse work. There are many beautiful illustrations and lists of plants which have been tested under California conditions.

One feature not mentioned which is worthy of special note is Chapter five, the matter of which is almost entirely new in this edition. It has to do with transplanting large trees and is given from the wide experience of Mr. McLaren in moving many trees of immense size on the grounds of the exposition. His method of moving these is given explicitly, not only the actual work of moving but the work of preparing the tree for the ordeal.

The Lawn and Flower Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

THOSE who have not already planted asters should get them in the ground as soon as possible. Late flowering stocks. including Nice, Perfection and Brompton, should be planted now for fall and winter blossoming, also snap-dragons and all of the late summer and fall bloomers. For shade places nothing succeeds so well as Primula malacoides. It is as hardy as many of our California wild flowers and blooms practically the entire year through. It ranges in color from tan to rosy lavender and pure white. It grows about one foot to a foot and a half in height. The stevia and statice should have a place in every garden. These bloom at a season when flowers are scarce. Cut and tied in bundles they will keep for months and are the best of our everlasting flowers for bouquets. Solanum, commonly called Jerusalem cherry, is also an excellent flower to plant for decoration during the holiday season.

Bulbs are now ripening down and inquiries are coming in almost daily as to best method of handling these. The anual winter flowering bulbs such as daffodils, tulips, hyacinths and the class of bulbs commonly called Dutch bulbs, should be allowed to thoroughly ripen down, when they may be dug and stored in sand or in a cool shady place in the cellar and held in this shape until fall. If left in the ground keep perfectly dry or the bulbs are apt to "go blind" or fail to flower the next season. If properly handled most of these bulbs will increase and do well.

This month is the best time of the year to plant chryanthemums. If already planted they should be carefully watched and headed back close to the ground so as to make fresh new canes. As a rule best results with chrysanthemums are secured by planting from the 15th of May to the 1st of June.

KILL DANDELIONS IN THE LAWN

I saw an article in Cultivator about dandelions in lawn. I am using distillate. I use an oil can and drop a small amount in the center of each plant. If too much is used it kills the ground for some time and leaves a dead spot. It is a slow job and hard on the back, and may need to be done over several times. I believe it will do the work.—E. A. C.

THE PANAMA PACIFIC INTERNATIONAL EXPOSITION is the World's Greatest Beauty Spot. In its buildings and grounds will be found many things of vital interest to every agriculturist. DON'T FAIL TO GO and when there SEE THESE SPECIAL EXHIBITS.

SOMETHING DOING

This is not an especially noteworthy week but still there are scheduled a number of events for this and the following week which will add to the interest in various parts of the grounds. The movies are material factors in entertainment. Perhaps it would not be correct to say there are hundreds of moving picture attractions on the grounds but there are at least many. Every day there are two moving picture performances in the live stock building. These have to do entirely with live stock and methods of handling in different countries. The program is changed twice each week. There are also movie demonstrations in nearly all of the government exhibits and there is hardly a portion of the grounds but what one may run in and sit down and be entertained and instructed while resting. Literally thousands of reels will be shown and all will be of interest to agriculturists.

On May 10, 13, 18, 20, 25, 27 and 31 there will be Field Dog Trials. These Field Dog Trials will exhibit sheep dogs, man hunting dog chase, whiffle racing, war dog trials and parade of bench winners.

In the poultry building the candling of the eggs takes place every day at 4:30. Also in this building an exhibition of an electric brooder with live young chickens begins every day at 9 a. m. A lecture accompanies this demonstration. The Calf Way Milker in the live stock building is in operation every afternoon at 3 p. m.

Racing pigeons are now in training for the races this fall.

One hundred and fifty to 200 horses were received last week.

The American Ornithology Union will hold its annual session May 24-27.

The National Lumber Manufacturers' Association will hold its annual on the grounds May 18-20.

The University of California department of agriculture will hold a Cereal Conference May 24-27.

SEE THE BULB EXHIBITS

One exhibit which many will fail to notice because it is somewhat out of the way unless called to their attention is that of the Netherlands in the open space between the Palace of Horticulture and the Inside Inn. In fact, it is right near the Baker Street entrance Here are thousands of varieties of Dutch bulbs. There are also most interesting exhibits of formal pruning in which the Hollanders are experts. Trees are pruned in the form of birds, animals and urns, baskets and other objects. One could well spend a day in examining this interesting exhibit, which is one of the most extensive of the horticultural exhibits made by any European country.

FOUR THOUSAND DOLLAR TREE

One tree which is well worth seeing, and one which can easily be seen because of its nearness to the Avenue of the Palms which leads past the Tower of the Jewels and on past the buildings of the various states and foreign nations, is Thuya Obtusa, a tree brought from Japan by The Yokohama Nursery Company. In conversation with Mr. Seizo Suzuki, manager of the company and in charge of installation of the exhibit, he replied to a question as to the age of the tree that no one could tell but it was certainly 800 and possibly 900 years old. It has been grown and dwarfed until now at this great age it is but little higher than a tall man. It is gnarled and wrinkled and shows its age.

As to the value of the tree, we may say it is somewhat beyond the pocketbook of most of us for $4000 was fixed as about the price at which it would be sold. We doubt not a little could be shaded from this figure for spot cash. However, this is not an advertisement but is merely to call attention to this tree which is only one of many most interesting ones in the exhibit made by this company. American growers who have an ambition to grow 800-year-old trees should lose no time in starting the crop.

SEE OUR SILOS AT THE EXPOSITION

For the benefit of those desiring to learn about a silo and its advantages by observation and demonstration we have erected on the Exposition Grounds two of our famous

Remco Redwood Silos

They are located on the main road leading to the Stock Exhibit, on the east side of the Dairy Building.

Our representative is always on hand and will take pleasure in explaining the many advantages which these silos have, and also profitable silo operation in general.

Make it a point to see this silo. For a pamphlet before going, write to the

Yolo, Wednesday, May 26.

Woodland, Thursday, May 27.

On Saturday, May 8, a meeting is planned of all progressive dairymen of Yolo County, when several things of importance will be taken up. The evening's discussion will have to deal with Cow Testing Association, Community Breeding, Better Care of Milk and Cream on the Farm, and the proposed Condensary in Yolo County. Good work has been done along the first two lines, and further support is to be asked for. A supper will be provided.

The Yolo County Hog Raisers' Association is making a cooperative fight against the promiscuous spread of hog cholera, the main items being quarantine, sanitation, and the early recognition of disease and prompt control measures. A code of ethics is signed by stock men, and if lived up to will do a great deal toward suppressing this disease. A board of control, with a member in each community, will keep in careful touch with conditions and will secure prompt aid in each outbreak in that community.

The subject of Modern Dairy Management will be discussed at these meetings. A stereopticon lantern will be used for illustrations. An attempt will be made in these lectures to show the farmers practical ways to keep even the smallest dairy perfectly clean and sanitary.

In answer to the Cultivator's inquiry as to community meat clubs and progress of the new cow testing association in Napa County, Mr. Baade writes:

"I might state that we have, temporarily. organized three meat clubs in our farm centers. The organization is nothing elaborate. They merely elected a secretary whose duty it is to inspect every animal before it is slaughtered. Each member of the club, who slaughters the animal, distributes the meat to its members, receiving cash therefor upon delivery. It is to be hoped that each center will have such clubs in the near future.

"We have enough cows in our Cow Testing Association to start testing. It is merely a matter of getting this into definite form and hiring a tester, which I hope will be done in the near future."

Answering your question as to hog cholera, the disease broke out in one small herd of about 40 head of hogs. There has been no other loss and I think the disease has been stamped out.

Maricopa County, Arizona, Jas. A. Armstrong, Adviser, Phoenix

Higley, organization meeting, May 3.
Lehi, May 6.
Roosevelt District, May 11.
Gilbert, May 15.

Adviser Armstrong writes:

"Prof. G. W. Barnes and I have been trying to secure enough cows to warrant starting a cow testing association. We have been working around Gilbert, Mesa and Chandler but have only completed the Gilbert district, where we have secured the pledge of 289 cows. A minimum of 600 cows will be necessary.

"The following dairymen have subscribed to the contract: J. F. Appleby, 20 cows; J. S. Tuley, 10 cows; O. L. Stewart, 10 cows; J. O. Welch, 20 cows; Geo. W. Peterson, 10 cows; A. C. Ware, 10 cows; J. S. Peterson, 40 cows; Crawford & Davis, 20 cows; W. O Phelps, 20 cows; W. G. Worman, 15 cows; A. B. Millett, 10 cows; J. H. Norton, 10 cows; J. D. Allen, 10 cows; W. H. Bukey, 10 cows; A. A. Dewitt, 10 cows; H. M. Hall, 10 cows; G. H. Elsworth, 10 cows; H. H. Taylor, 20 cows; S. F. Hockinsmith, 14 cows; L. M. Sigman, 10 cows.

We expect to start work on our ant campaign about June 1. We will send out 5000 double post cards in a few days. on this card is the following statement:

"Whereas the harvester ants are responsible for an annual loss of $50,000 to the ranchers of this valley, and are known to be spreading, we have, therefore, undertaken a cooperative campaign against them.

Our plan is to encourage responsible individuals to contract to exterminate them for you at 15 cents per nest; five cents to be paid at the time of making contract and balance when exterminated. It is understood that said contractor will report weekly to his office on all work done, and that final payment will be dependent upon satisfactory reports.

"If you wish to do your own work, we will be glad to inspect your work from time to time, advise you where 'Tested' London purple can be obtained, special prices, etc."

WILL DISTRIBUTE SELECTED KAFIR

Selected black hulled white kafir seed will be distributed in limited quantities for experimental purposes and for seed production during the coming season by the extension service of the University of Arizona.

Farm Adviser Jas. A. Armstrong, Water Users' Building, Phoenix, Arizona, has a small amount of this seed and will give it out on certain conditions, the main ones being that the seed will be planted so that it will not mix with other sorghums; that the grain will be kept for seed, and that

HARVESTER ANTS HAVE FOUR LIVES

Interesting facts about habits of the "Great Pest" of Salt River Valley, by Farm Adviser Jas. A. Armstrong.

The fact that a harvester ant has four lives or stages of the same life accounts in part for the great difficulty experienced in their extermination. These stages are each separate and distinct from each other. and in each the habits are entirely different.

First Stage—Egg. It resembles all other eggs in being dormant until a sufficient time passes when it will hatch like other eggs.

Second Stage — Hatched egg or "worm stage," technically know as the larva. It is in this stage that it consumes all of the food necessary for its develoment to an adult.

Third Stage—Dormant or immature adult, known as the pupa. In this stage it is practically dormant. It can not move in this stage, and does not consume any food.

Fourth Stage—Adult ant as seen above ground. It consumes food and gathers food for the second or worm-like stage.

If a slow poison such as London purple is given the worker ants it will be carried to the larval stage and will kill both, but this will leave a great number of eggs and also a great number of the pupae or third stage, both of which do not eat, consequently cannot be poisoned.

If only one treatment is given a nest or a new entrance is made it does little good because some eggs will hatch immediately and some pupae will emerge as workers. These workers immediately start to feed the young which hatched into the worm stage and the colony is soon as strong as ever.

The only treatment which can be successful is one which will contnue until all of the third stage have been killed and none of the second stage have been allowed to develop into the third or dormant stage. At this time the second, third and fourth stages are all dead. Eggs which may hatch after this time can not mature because they cannot pass the second stage without worker ants to feed them, because they are helpless to feed themselves and moreover most of the stored food is probably also poisoned if the work has been carefully done.

COST OF KEEPING AN AUTOMOBILE

Automobiles are so generally kept by farmers nowadays that the following account of the cost to a farmer of keeping an automobile the first year, taken from a recent issue of Farm and Fireside is interesting:

"For the benefit of those who are thinking of buying an automobile, the following account of one year's run may be of some help in determining whether you can afford one or not. The first cost of my machine was about $950, including one extra casing and tube.

Chains (second-hand)	$ 2.50
Cylinder oil used	8.00
Grease	3.90
Gasoline (269 gallons)	44.36
1 Casing	18.00
2 Presto tanks	4.50
Chain repairs	1.56
Cement	.65
2 tubes (1 not used, other has one puncture)	7.00
1 casing and cover	18.45
Batteries	1.25
Insurance	18.00
1 set snubbers, rear	18.00
Vulcanizing 2 casings	7.75
Electric horn	10.00
2 tire-saving jacks	1.90
1 voltmeter	1.50
1 socket wrench set	2.10
1 flash light	1.25
Express on supplies	3.00
Repairs	.15
	$173.82

"The expenses given are cash; expenses do not include housing, depreciation, license nor taxes, which vary according to size and value.

"As to insurance, horn, clock and such things, they can be left off and cut down first year costs considerably. For myself, I believe the expenditure paid."

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

MEAT CLUBS

Farm bureau centers of Napa County have organized a series of meat clubs which are materially reducing the living cost and materially increasing farm comfort. The plan of the clubs as outlined by Farm Adviser H. J. Baade, is for the secretary of the club to make inspection of meat and give certificate of its freedom from disease. Then the meats are distributed to other members of the club. Another day another member of the club does the slaughtering and the meat is distributed as before. This results in more satisfactory prices for the meats used by the members.

CHERRIES RIPE

On deciduous page is a communication from a Kansas City subscriber and one from a subscriber in Vaca Valley in our own state. They seem to be somewhat at variance, but the Kansas City communication may draw attention to a practice of which Californians need to know. Mr. Young, who is an attorney in Kansas City, wrote us last year of the injury done the California market by green cherries. In his communication this year he says: "Now here comes along the same small unripe cherry from the Musser Ranch at Vacaville. At least that was marked on the box."

Before giving this place in our columns we wrote Mr. M. Sharpe at Vacaville and asked for information as to this Musser Ranch. As will be seen in his communication, there is no such ranch in the Vaca Valley. Is someone shipping inferior fruit to the injury of one of our finest fruit-producing sections and hiding behind a fictitious name? The matter is worthy of thorough investigation by California fruit growers.

CITRUS FRUITS

Some months ago we referred to the fact that Dr. J. Eliot Coit was working upon a book treating of citrus fruits, which would be published by the Macmillans in a very short time. Just as we go to press our first copy arrives and we have not time nor space for a review but announce that all who are interested in citrus culture may now secure this book through the Cultivator office. The business department will make announcement of clubbing price of the book with the Cultivator.

This book is one of the Rural Science Series, edited by Liberty H. Bailey. It is a book of 500 pages, well printed, well bound, beautifully illustrated, and filled with information as to all varieties of citrus fruits. Of course primarily it is cultural and practical. More information regarding it later.

PRODUCE MORE

Speaking of the value of fertilizer an eastern farmer states that he used 300 pounds per acre. This gave an increase of crop over and above the cost of the fertilizer per acre of $8.25. If farmers the United States over would make a similar increase, all the rest of the world could continue at war and still we would be able to feed it. This farmer says:

"In one instance, a 40-acre field from which we cut 25 loads of hay in 1907, last year cut 90 loads. Further than that, the land keeps improving year after year, because of better management supplemented with commercial fertilizers."

Taxes, the cost of cultivation, and interest on investment would be no greater; even harvesting expenses would be only slightly higher because of this increase. We are aware that the usual argument used against this method is that we are now producing more than we can get good prices for. Perhaps this may be true, but even then would it not be wise to dispose of half of the land and produce twice as much on the remainder?

EXPOSITION PAGE

On page 537 is an outline of some of the events scheduled at the Panama-Pacific Exposition grounds at San Francisco, also some information regarding many of the interesting exhibits on the grounds. In addition there are authorized announcements of some of the exhibitors whose names are familiar to Cultivator readers because of their having used the columns of the Cultivator for many years. We believe this will be an interesting feature for those who will attend the exposition. "Those" means practically everyone in California, for this great educational event is worthy of sacrifices being made to see it. Certainly every farmer will avail himself of this opportunity. When the immensity of the great Palace of Machinery is considered, it seems as if mechanics is given the greater attention at the exposition. But once one is in the Palaces of Foods, of Agriculture and of Horticulture and sees the scores of acres given over to live stock and poultry, it is plain that agriculture occupies a greater part of the exposition grounds.

THE WEATHER

We wish to assure our Eastern visitors that the streak of weather which has been given to California during the past few days is "exceptional." Fortunately we can prove our statement this time by the weather reports; they show that not for 33 years has there been during the opening days of May such heavy precipitation as has been given to us this year. Worse than all, the rainfall was preceded by a terrible wind storm. It did immense damage on the ocean and along the oecan front. Perhaps one of the worst sufferers was the little town of Redondo where estimated damage to the extent of $175,000 was done by wind and waves. Several fishing vessels have not been reported from the harbor of San Francisco and it is presumed they have gone down. As a rule the rainfall will be of greater value than damage. Some volunteer hay and alfalfa, in a few sections a very little regular crop barley hay, has been injured. By far the greater portion is yet to cut, and some late sown crops will be far heavier because of this rain. Orange pickers are losing because they cannot pick and cherries are injured.

California is nothing if not different, and this year of 1915 is different in many ways.

ORANGE PRICES

Commenting on prices quoted on this page a couple of weeks ago, Mr. J. G. Berneike of Santa Ana writes on citrus page this week of prices which are being received by the grower, and from the figures which Mr. Berneike takes as the basis of his argumen he makes a showing of a most serious condition for the producer of citrus fruits. But while Mr. Berneike's figures are true as to one man or one particular pool of one association they are far from true as to averages. For we know that hundreds of thousands of boxes sold since January 15 have averaged far above $1.00 f. o. b. In fact, from these sales it is seen that the average returns to growers have been in excess of 75 cents.

We believe it has cost the growers in excess of 75 cents to produce this fruit, therefore we would not present these figures to give the idea that the grower is receiving just compensation, but to reach an average conclusion we must take average returns.

It is perhaps true that the present condition of the market will cause an amount of thought on the part of producers which will result in a bettering of the market conditions. It cannot be claimed that they are perfect at the present time, but they are far nearer it than some of the methods which have been suggested by those who would see present marketing plans discontinued.

Regarding the figures given in the former Cultivator, they are the prices paid by consumers. We are glad to have additional figures this week from the city of Cleveland. These were secured by an entirely disinterested party, an attorney of that city, Mr. H. H. Johnson. He writes that the better grade department stores do not handle fruits. The five and ten-cent stores, of which there are three immense concerns, made an effort to handle oranges, but not having the proper facilities for handling, lost money on the deal and refused to handle any more. The popular-priced department stores handle them, and in the prices given below it will be seen that they are selling higher than in some of the smaller towns outlying. Prices given below were all secured on April 26.

Prices for Sunkist oranges prevailing at Chandler & Rudd Company, April 26:

Size 96, per dozen 55c; per box $3.75
Size 100, per dozen 55c; per box 3.75
Size 126, per dozen 45c; per box 3.75
Size 150, per dozen 35c; per box 3.75

Sunkist prices at W. P. Southworth Company:

Size 96, per dozen 45c; per box $3.50
Size 126, per dozen 38c; per box 3.50
Size 150, per dozen 34c; per box 3.75

Sunkist prices at Brandt's (Sheriff Street Market): (Buys at auction. No regular box prices. Profit varies from 10 to 60 cents. Aims to average 35 cents per box.)

Size 64, per dozen, 75c
Size 80, per dozen, 50c
Size 96, per dozen, 45c
Size 100, per dozen, 45c
Size 126, per dozen, 40c
Size 150, per dozen, 30c
Size 176. per dozen, 25c

The Matthew Smith Company's chain of 10 grocery stores and a like chain of Fisher Brothers sell mixed brands and use three sizes: 126's, 150's and 176's, average price of about $3.00, and varying prices from 25 to 40 cents per dozen. This probably will apply to grocers generally throughout the city.

The five and ten cent stores had one special sale at a low price, but not likely to have another owing to loss in handling without facilities for doing so.

Agricultural Notes

The American Association of Nurserymen will meet in Detroit, June 23-25.

To its slogan, "Safety First," the Pennsylvania Railroad has added "Courtesy First."

In Canada all passengers by railroad now have to pay a tax on both railroad and sleeping car tickets.

The United States weather bureau inaugurated a weekly weather forecast service. The forecasts will cover the week commencing Wednesday.

The fact that American cotton shipments totaling thousands of bales are being held up in European ports is giving cotton exporters great concern.

The jitney service, so popular in the United States, has moved east in Canada from Vancouver and Winnipeg and is now successfully established in Toronto.

The International Soil Products Exposition will be held at Denver, for two weeks, beginning September 27, in conjunction with the Dry Farming Congress.

Kansas, Wyoming, Nebraska, Oklahoma, Texas and Arizona have made state appropriations for displays at the International Dry Farming Congress at Denver.

The melon and cantaloupe acreage in Florida is 50 per cent short as compared to last season. The cold weather during February and March did much damage, destroying many acres which the growers did not replant.

The Illinois Central Railway has a catalpa plantation near New Orleans where it is growing cross ties. The trees are planted four feet apart. As they grow they will be thinned for fence posts, leaving the trees to be used for cross ties, 12 feet apart.

The latest business aid service instituted by the government is a wood-waste exchange. It enables lumbermen and manufacturers in the various wood-using industries to utilize each other's waste to mutual advantage, aiming to effect a large saving in forest material as well as in money.

The Wisconsin assembly has passed a bill prohibiting the giving or offering of any gratuity by patrons of any hotel, restaurant, barber shop or public service corporation engaged in the transportation of passengers. The penalty is a fine of from $5 to $25. The lower house of the Minnesota legislature has passed a similar bill.

Approximately 6000 potato distilleries are in operation in the German empire. The manufacture of alcohol for technical purposes, not for human consumption, is regarded as a necessary factor in general farming. The distilleries provide a market for Germany's potato crop, which is enormous; and the spent mash is returned to the farmers and used for feed for cattle, which in turn enrich the land and thus enhance productivity.

One farmer in a Central-Western state is reported to have refused to let the veterinarians go to his barn to inspect his stock until he had seen them fumigate themselves. His reason was that he did not want to take any chance on having foot-and-mouth disease or hog cholera carried onto his premises by these veterinarians. The latter refused to fumigate, and forthwith placed the farm under quarantine, without further investigation. The matter went up to the state veterinarian, and that official sustained the farmer, commending him for his caution.

Agricultural News Notes of the Pacific Coast

Northern California

The asparagus shipping season of the Delta section is over.

Nearly all of Sutter County's sheep are now sheared by machinery.

Sacramento Valley wool growers are selling wool around 20 cents per pound.

The state college of agriculture will hold a grain conference at Davis on May 16.

Stock raisers of Shasta County report spring grazing in exceptionally fine condition.

Gravenstein Day at the Panama-Pacific exposition is now being proposed by Sebastopol apple growers.

The Davis unit of the Yolo County farm bureau at its last meeting discussed brown mite and red spider.

Live Oak, Sutter County, recently marketed over 2,000,000 pounds of beans in the San Francisco market.

Articles of incorporation of the Mendocino Farmers' Club have been filed. Its principal place of business will be Mendocino City.

The Sebastopol (Sonoma County) Berry Growers' Association is receiving 2,880,000 baskets for handling berries which it will ship East.

Prof. Bioletti of the University of California gave a demonstration of the use of sulphur for mildew of grape vines at Reedley April 17.

The California Swine Breeders' Association held its annual meeting in the hall of congresses at the Panama-Pacific grounds Friday, April 23.

The Sutter County Cured Fruit Association has decided to organize a supply company with capital stock of $150,000. The former board of supervisors has been continued in office.

At the last meeting of the Davis unit of the Yolo County farm bureau all farmers present were requested to sign the hog cholera agreement which was framed by the Yolo County Swine Raisers' Association.

A sheep raiser at Los Molinos, Tehama County, has figured that it is possible to pay $65 per acre for land on which to raise sheep. He maintains that an acre of Sacramento County land will support 12 sheep.

A swine breeder at Fairoaks, Sacramento County, makes it his business to breed the youngsters and "farm out" to dairymen who feed and care for them on shares. When he takes them back it is on a basis of payment for the number of pounds increase.

The $500 appropriation made by the Lassen County supervisors toward the fund for having a survey made of the proposed Southern Lassen Irrigation project has been forwarded to the supervising engineer of the United States Reclamation Service in Portland, Oregon. The government will put up a like sum.

The Glenn County farm bureau has elected officers as follows: President, D. C. Cowan; treasurer-secretary, E. A. Kirk; directors, H. M. Giller, Bayliss; W. C. Saxon, Ord; S. C. Langford, Orland; O. L. Raper, Larkin; Guy Wait, Jacinto; T. L. Linville, Cordova. The directors at large are W. W. Forster, Princeton; James Mills, Hamilton City; E. A. Lindstrom, Orland; Frank Fox, Glenn P. O.

Central California

Stanislaus County will have a farm adviser after May 1.

Kern County estimates it will produce over 5000 sacks of rice this season.

The road to Sequoia national park has been cleared of snow and is now open to automobiles.

The Turlock farm bureau is encouraging farmers to make an organized fight against hog cholera.

Auto races were the principal features of the May Day celebration at Los Banos, Merced County.

Many peach growers of the San Joaquin Valley are urging on a united fight to stamp out Little Leaf.

Oakdale, Stanislaus County, is planting very largely of beans; one planter is putting in 100 acres of teparies.

The Modesto chamber of commerce is already organizing to make a fight for the $12,000,000 state road bond issue.

Merchants of Turlock are raising the final $6000 needed for completing the work of the Turlock Merchants' and Growers' Association.

Tulare County orange growers are sending organizers to Southern orange districts to aid in perfecting a new retail orange marketing association.

The California Associated Raisin Company has announced that the Bonner Packing Company at Fresno has ceased its affiliation with the Associated.

Grape growers of Wolters Colony recently met President Giffen of the Associated Raisin Company to discuss means of securing a larger acreage for the association in that district.

Orange growers of Tulare and Fresno Counties are planning for a great fight against gray scale. A mass meeting of growers was recently held at Orosi to perfect an organization to more effectively combat the pest.

The San Joaquin Valley is already organizing its forces to aid in the entertainment of the International Irrigation Congress which will be held in California September 13-20. Fresno hopes to entertain at least 3000 of the delegates on September 15 and 16.

A San Joaquin Valley newspaper is warning farmers of a traveling agent, who claims to be representing a poultry periodical, and in addition is inducing shipping of eggs to a concern which he assures the poultrymen will pay 30 cents per dozen the year around.

The raisin seeding plant of the California Associated Raisin Company in the horticultural building at the San Francisco exposition is proving a big attraction to sightseers. This exhibit has proved so popular that the Associated will install another seeding machine in the food products building.

The forest rangers of California have formed a mutual horse insurance association for the purpose of distributing the loss that occurs when their saddle or pack horses are killed or disabled. The scheme was given a trial last season with 177 rangers in the association. This season it is expected to enroll about 900.

Southern California

The walnut crop of Santa Barbara County is reported heavy.

The cotton gin at Blythe, Riverside County, has been closed for the season.

Southern California was visited by freak storms during the last few days of April.

Orange packing houses at Pomona, Los Angeles County, are running full-handed and overtime.

A company is being organized to put irrigation water on the mesa back of the Palo Verde Valley.

Palo Verde has over 100 tons of cotton seed which is unmarketable because of no railway facilities.

Citrus growers of Southern California are still agitating the problem of securing more livable prices for their fruit.

Pomona growers received nearly $30,000 as a result of one day's sales by the San Antonio Fruit Growers' Exchange.

Imperial County has 22,000 stands of bees and is considered one of the leading honey producing counties of the United States.

Bean growers of Ventura County are advised to trap wire worms by the use of potato bait. The cost is said to be not to exceed $3.50 per acre.

Santa Ana, Orange County, has an ordinance demanding full sized berry boxes. Los Angeles fruit shippers declare they will test its validity.

The Imperial Valley is making a test of a concrete automatic water gate. It will probably be installed generally throughout the irrigation system of the county.

Deputy State Horticultural Commissioner Weldon is in the Southern end of the state looking up matters in connection with the possible introduction of the alfalfa weevil pest from Utah.

The San Fernando Fruit Growers' Association packing house is sending out on an average of three cars of fruit a day, approximately half oranges and half lemons. The association is using 115 employes.

A new feature of bean culture in San Diego County is the use of nitrogen bacteria cultures. This idea was taken from Germany, where it is stated that last year over 5,000,000 acres were planted with inoculated seed.

Dairymen of Southern California met recently in Los Angeles and discussed the matter of prices now being paid by creamerymen of Los Angeles. A fee of one dollar is necessary to become a member of the dairymens' association.

Unless lima bean growers pool the crop of 50,000 acres for a period of five years with the Lima Bean Growers' Association before June 1 of this year the association will be discontinued. This was the decision reached by the board of directors at its last meeeting.

The Santa Paula Farmers' Club held its regular monthly meeting April 26 in the high school auditorium in conjunction with the Santa Paula and Saticoy farm centers. County Farm Adviser W. B. Parker gave a stereopticon lecture on the wire worm.

The Coast

Colorado apple growers are organizing cooperative marketing associations.

Thousands of Arizonans gathered at Roosevelt and celebrated the filling of that great reservoir.

Rooster Day in Arizona has been changed by the Arizona Poultry Association to May 22.

Some sales of mohair are reported in Portland at 31 and 32 cents, with a probability of higher prices.

Governor Hunt of Arizona has removed the quarantine against live stock from New Mexico, Texas and Colorado.

Cattlemen of Agua Fria, New River Country, Arizona, are putting up heavy hay crops and shoeing their ponies for the round-up.

A new evaporator has been installed at the Dalles, Oregon, which it is estimated will turn out at least 700,000 pounds of dried fruit and vegetables each season.

Arizona farmers are finding difficulty in obtaining crops from seed raised under conditions entirely different. An effort is now being made to secure acclimated seed.

Portland grain men are discussing the proposition of establishing public elevators. Voters will be asked at the June election to pass on a $900,000 bond issue to build same.

The Gridley Cow Testing Association is composed of 26 herds with a total number of 1200 cows. These are scattered throughout Butte County and parts of Yuba and Sutter Counties.

At the Moulton Irrigated Land Company ranch east of Colusa, there are eight engines and 400 head of horses and mules being used in getting the land in readiness for rice planting.

A convention was held at Spokane, Washington, on April 28 of various apple growing interests of the Northwest to decide on a standard for grade and pack of apples for the coming season.

The business men of Magdalena, New Mexico, have asked the members of the Southwestern New Mexico Cattle Growers' Association to meet with them May 12 to 14 for the purpose of perfecting a state organization.

The locals affiliated with the California Cured Fruit Association now number 26, with an aggregate membership of 1564 growers. The tonnage of fruit handled in 1914 was about 20,000,000 pounds, as against 12,000,000 in 1913.

Sheep men of the San Rafael Mountains of New Mexico report heavy losses of sheep the past winter due to unusually heavy snows. It is reported that one man has lost upwards of 5000 head, while others have lost from 2000 to 3000 head.

Pima County, Arizona, has a cattle population of 50,000 head, so says the Tucson Citizen. This has been estimated by a well known stockman who has spent several weeks in a very careful study of the situation. He figures the total valuation at $1,050,000. The figures do not include the cattle owned by the Papagoes.

DE LAVAL

Cream Separators

are not the mail order or farm implement kind

EVERY prospective buyer, as well as every user of an inferior cream separator, should always keep in mind that there is a very decided difference between the De Laval and either the so-called "mail-order" or agricultural implement kinds of cream separators.

DE LAVAL Cream Separators may cost a little more than other separators to begin with, but they save this slight difference as a rule the very first month, and go on saving it every month thereafter, while they last from ten to twenty years longer than other machines.

The differences are self-evident

THE differences between De Laval and other separators are not difficult to see or understand and no one needs to be an expert to appreciate them. A De Laval catalog to be had for the asking makes them clear, and a De Laval machine itself, placed side-by-side with any other, does so better still.

EVERY De Laval local agent is glad to afford such an opportunity for comparision without cost or obligation to buy. If you don't know the nearest De Laval agent simply address the nearest office of the Company as below.

THE DAVIS FARM ANNUAL PICNIC

(Continued from Page 531)

needed in California, and hundreds of farmers and fruit men could keep small flocks, the produce from which would aggregate thousands of high grade, well-finished carcasses annually.

The dairy stock is in better condition this year than ever in the history of the institution, and there are many young Holsteins, Jerseys, Guernseys and Ayrshires that are very promising. They are in splendid condition and are being well cared for.

One of the things that was of particular interest to stockmen and all interested in increased quantity and

AT UNIVERSITY FARM PICNIC
Baled Hay Archway at Entrance
The Hog Float
Listening to Addresses

quality of California grown beef was the improvement that has been made in the beef cattle division. In addition to a very representative lot of Aberdeen-Angus, Hereford and Shorthorn breeding animals a splendid lot of steers are being fed. Some of them are likely candidates for the highest honors at the Panama-Pacific International live stock show this fall.

The poultry department is a big division now with all kinds of appliances and breeds, and hundreds of fanciers and "just plain growers" of chickens visited the buildings and pens.

The interest in hog cholera was shown by the large number of people who attended the demonstration and lecture conducted by Dr. F. M. Hays of the University farm and Dr. Bert Cady of the United States department of agriculture.

A sick pig from a farm in Yolo county was killed and examined. It had a temperature of 105 and the red pin point marks characteristics of the disease were first found in the submaxillary glands at the point of the jaw. Examination of the lungs showed an infection of pneumonia which added to the lowering of the vitality of the pig which was very thin and weak. Characteristic hog cholera red spots were found on the kidneys after the capsule or covering was removed and a well developed ulcer was found on the lining of the intestines. Any or all of these lesions, in addition to the high temperature (normal is 101 to 103½ degrees Fahrenheit) proved the presence of the hog cholera germ.

Care was taken to keep the visitors at the demonstration from carrying the infection away with them, and two overcurious and interested people who walked across the drain into which some of the offal had passed were required to disinfect their shoes with a five per cent solution of liquor cresolis compositas.

Two pigs were immunized from cholera by administering the simultaneous virus and serum treatment—which was explained in detail, immunizing them for life. One question that interested many people was how young a pig can be vaccinated with a reasonable assurance for life. The answer was eight to ten weeks, or two weeks after weaning. An immune sow transmits protection to her pigs for about three weeks. If it is desired to protect the pigs for the period between the age of three and eight weeks they may be given a dose of serum alone. It was explained that nine out of every ten hog that die in the United States have cholera, so that the sickness of several hogs in a herd and the death of a few is ample reason for getting in touch with the veterinary department of the University.

After May 1 the cost of serum from the University of California is to be reduced to 1½ cents per cubic centimeter from two cents now charged; and it is understood that commercial serum manufacturers are planning to sell their product in California for 1¼ cents per cubic centimeter.

There were swimming races, field sports, ball games, catching the greased pig, a band concert, and other attractions to interest young and old during the entire day, and lunch baskets, sandwiches, meals, buttermilk and "made on the farm" grape juice—food and drink in plenty for all—were provided.

And folks go home from this picnic not only glad they came and determined to come again next year, but enthusiastic in urging their neighbors and friends to benefit by the instruction and entertainment of the next picnic.

Swine Breeders Annual Meeting

At Which Officers Were Elected and Business Transacted. Written for Cultivator

EXTENSION was the watchword at the meeting of the California Swine Breeders' Association in the Hall of Congresses during the Live Stock Show at the Panama-Pacific International Exposition in San Francisco, April 23, 1915.

A new movement was started to increase membership in the organization and this promises to be followed by greater activity all along the line for more and better hogs in California, and in addition to the present officers and directors of the association a vice president for each county in the state is to be appointed.

The meeting was well attended by representative breeders and growers, the program was of extraordinary merit, and the affairs of the association, with A. M. Henry as president and Professor J. I. Thompson as secretary, and an efficient board of directors, have progressed well during the past year. And greater progress is to be made during the coming 12 months.

California hog growers have much to learn from the Pacific Northwest—Oregon, Washington, Montana and Idaho—and one of the leading agencies in the upbuilding of the hog industry in that territory has been the educational and extension work inaugurated and fostered by the Portland Union Stock Yards. Hundreds and thousands of hogs—and lots of good hogs—are being grown in parts of that section where none were produced before.

In a very able address C. M. McAllister, special representative of the Portland Union Stock Yards, urged California breeders to hold shows and sales and to work to increase membership and production.

Mr. McAllister spoke about the stock yards situation, declaring that San Francisco should have an open live stock market where any one can ship any class of stock to be sold by commission men to the best advantage—the same as there is at Portland, St. Paul, Sioux City, Omaha, St. Joseph, Kansas City, St. Louis, Fort Worth, Denver and Chicago. The interests of the small producer are urged as the best reason for a stock yards, that in the competition of the open market quality alone counts and he is on an equal footing with the grower and finisher of larger numbers of animals.

It is contended by those who oppose yards for San Francisco at the present time that it would be a disadvantage rather than otherwise to the small man in that a big per cent of the stock

marketed now in California comes from a few big concerns, and that if a small grower should be on the market with unsold stuff at a time when these big outfits would come in with big shipments, the market would be lowered because of the larger supply and the small shipper would suffer most because of the slump. Now he sells at home and gets his money before the stuff leaves the farm, and the prices on the San Francisco market are frequently the highest in the United States, quality considered, as in the case of hogs now. These same people contend that a stock yards is sure to come in time when the big ranges are cut up and when the bulk of the supply will come from small producers, and that it should be a cooperative yards controlled by the producer.

This stock yards proposition is now and will always be a live issue in California live stock circles.

J. L. Thatcher, recently manager of Iowanna arms, a big Holstein and Berkshire breeding establishment in Iowa, talked of the necessity for showing hogs at fairs and other advertising as a means of selling pure-bred animals. Mr. Thatcher is now located in California.

Professor W. J. Kennedy, formerly of the Iowa state agricultural college, but now president of a hog cholera serum company, talked of hog betterment, and Dr. Bert Cady, hog cholera expert of the United States department of agriculture, who is now doing extension work in California in connection with the agricultural experiment station, gave his illustrated lecture on hog cholera.

During the past year the California Swine Breeders' Association has published and sent out a booklet on the different breeds of swine.

All of the leading breeds were represented; Berkshires, Poland Chinas, Duroc-Jerseys, Chester-Whites and Yorkshires.

The following officers were elected: President, A. M. Henry, Farmington, breeder of Poland China; vice president, C. B. Cunningham, Mills, breeder of Chester-Whites; secretary-treasurer, Prof. J. I. Thompson, Davis; directors, J. L. Thatcher, Tracy, Berkshires; J. K. Fraser, Denair, Duroc-Jerseys; A. D. McCarty, Modesto, Yorkshires; A. B. Humphrey, Mayhews, Berkshires.

RAISING HEIFER CALVES

The records of two herds of dairy cows owned by two neighbors furnish a striking example of the utility of dairy records to the man who really wants to build up a good herd. The first man has been cow testing for four years and has selected his cows carefully, studying their various preferences and capacities, each one as an individual. He raises heifers from his best cows; four two-year-olds gave last year an average of 7,144 pounds of milk, while his herd of ten gave an average of 8,059 pounds of milk and 259 pounds of fat.

The neighbor considers it simpler to buy just what cows he can.

He does not raise any calves. Last year his nine cows, all upwards of six years old, except two heifers, gave an average of only 4,240 pounds of milk. This is only just about one-half as much milk per cow as in the first herd. The best cow gave only 6,355 pounds, less than the average of the four heifers in the first herd. He has nothing on which to start building up a good dairy herd, unless it be his judgment in "picking a winner," which judgment, by the way, does not appear to be of A1 quality. The owner of the first herd has the advantage of four years of dairy records, practically indispensable to the real dairy farmer, besides matured judgment in handling cows to better advantage. Cow testing pays.—C. F. W., Dominion Depertment of Agriculture.

Rye meal ranks a little below corn and about equal to barley meal as a feed for swine. Rye produces satisfactory pork, especially when it is fed with other grains. It is an extremely heavy, concentrated feed and will usually give best results when fed not to exceed one-third of a ration. In many sections rye is much esteemed as pasture, especially where the soils are rather light, and in such instances "hogging off" proves profitable.

Economy of Operation and Dependability

Are Two Very Important Features in a Pumping Plant

The Alpha Gasoline and Distillate Engine

and

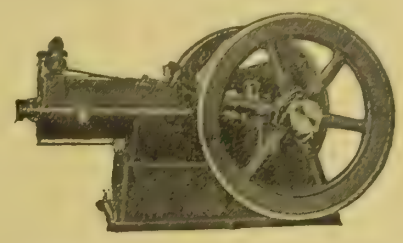
The Viking Rotary Pump

can always be depended upon to raise the maximum quantity of water with the least expense. Will run constantly without bother and with the minimum of attention.

No Batteries

No Coil

No Troubles



A Big Hot Spark

A Quick Start

Results

The Alpha Engine

has a built-in, gear-driven, gear-timed magneto, which is guaranteed for the life of the engine.

The Viking Pump

is not a deep well pump, but will raise water against a higher head with less expense than any pump on the market costing three times as much.

It can be used for any purpose for which a centrifugal is adapted, besides a great many others for which a centrifugal is not suited.

It is self-priming, requires no foot valve, is positive in delivery with low speed and high efficiency. Made in sizes from 1 inch to 8 inch, the latter delivering 1600 gallons at 230 revolutions per minute.

What are your pumping problems? Write us. Our expert engineers will advise you.

W. DAVIS & SONS'

Horse Collars

"Felt-Face" .....each $5.00
"Cushion" Collars.....each 3.00

This "Cushion" Collar is a combination of leather and canvas, guaranteed to cure sore shoulders and "stand the racket."

The "Felt-face" collar is all-leather, first-quality of oak-tannage, hand-thonged throughout. It has a facing of felt under the leather face, producing a soft yet firm surface against which the animal pulls.

It is natural for any manufacturer to say that his collars are "the best," but it is only about "FELT-FACE" collars that letters like this are written:

W. DAVIS & SONS, San Francisco.

Gentlemen:—I sold the Red Bands Orchard Co. two Felt-face collars about a month ago for two sore-neck mules which are all healed up now. They came in today and ordered one dozen. Please send me soon as possible 1½ dozen, from 17 to 22-inch. Very truly,

W. F. INGWERSON,
(Harness-maker) Visalia, Cal,

SHEEP AS WEED ERADICATORS ON SALT RIVER PROJECT IN ARIZONA

THE use of sheep has not only decreased the expense of cleaning Johnson grass from canals and laterals, but packing of the banks has practically eliminated all gophers, and it is estimated that leakage and breaks from that source have decreased at least 90 per cent. The maintenance foremen have commented upon the small amount of work required to maintain the laterals when sheep are used for cleaning purposes as compared with the greater amount of work, trouble, and expense incident to cleaning the same laterals in former years. The attached cost reports show the cost of maintaining canals and laterals before and after the introduction of sheep.

Methods of Handling Sheep

Very little change was made in the method of herding and handling sheep this year. Two herders have handled from 400 to 500 sheep and they experienced only a small amount of trouble in keeping them out of cultivated fields. This number of sheep confined to a canal bank means a line from 50 to 100 yards long and if the number were increased above this amount it would bother two herders to control them. The use of dogs was suggested, but after a little experience along this line it was decided that it was not practicable unless the dogs were exceptionally good, because the sheep would bunch and travel too fast, and there is also the additional danger of crowding them into fences and down the ditch banks. As the season advanced the sheep had to be herded very carefully on account of the heat. They were driven out of the corral at daylight and allowed to graze until about 10 o'clock when they were allowed to rest in the shade until 3 p. m., and then grazed until dark.

Feed and Costs

Johnson grass is unquestionably an excellent feed when young and tender, and the sheep are also very fond of the seed. Its feeding value is very high and the sheep prefer it to any other plant excepting alfalfa. Sheep also relish the following plants that grow on the canal banks: Sunflower, milkweed, sour dock, sour clover, bird clover, Bermuda grass, salt bush, young cockle burrs, and most tree leaves, including the willows. They will not eat tree tobacco, thistles, fox tail when headed out, and water grass when large. The growth of Johnson grass varies as the season advances. The grass reached the maximum growth during July and August and the rotation of trips had to be shortened in order to hold it in check. This necessitated some man labor in a part of the territory, but the cost of this labor has been included in the attached cost reports.

Losses

With a loss of only a little over two per cent it is evident that the herding and grazing of sheep on the canals and laterals is not hazardous. A large percentage of the two per cent loss can be attributed to aged ewes, which could not thrive under conditions prevalent along the canals. Injuries, sores, poisoning, and bloating, together with old age, accounted for a large part of the loss, and only three were lost by drowning.

General Results

The result of the work of the government sheep on the project has developed the following facts:

That Johnson grass, the most dangerous pest on the project, can be controlled and eventually eliminated from the banks of canals and laterals by the use of sheep.

That use of sheep has decreased materially the cost of cleaning canals and laterals.

That sheep drive out gophers and thus cut the cost of repairing breaks and reduce the loss of water by seepage to a minimum.

That it is profitable for the farmer to maintain his farm ditches with sheep.

That Johnson grass will fatten sheep in 90 days.

That sheep can be pastured on the canals and laterals without damage to the banks.

The ditches that were badly infested with Johnson grass two years ago were examined on October 31, 1914, when it was found that 95 per cent of the Johnson grass roots were dead and the other 5 per cent in such weakened condition that it wil require a long time to recover. In this connection it might be well to state that the destruction of Johnson grass was not entirely due to close feeding. The action of the sharp hoofs of the sheep was responsible for a considerable part of the damage.

GUERNSEY BREEDERS' TO MEET

The American Guernsey Cattle Club will hold its annual meeting in New York City Tuesday, May 11. The evening session will be held around the banquet table. An address will be made by Dr. Joseph L. Hills, director of the Vermont experiment station.

TREATMENT FOR STOCK POISONING

Practical demonstrations in the treatment of cattle for larkspur poisoning will be made by forest officers on two national forests in the Sierra region this summer. The officers will be furnished with a standard equipment of syringes and medicines, and subcutaneous injections of physostigmin salicylate, 1 grain, pilocarpin hydrochlorid, 2 grains; strychnin sulphate, ½ grain, will be used on animals weighing 500 to 600 pounds, doubling the dose for large steers and cows weighing 1000 pounds or more.

Experiments with this treatment, which is discussed in Farmers' Bulletin No. 531 of the United States department of agriculture, have shown about 90 per cent of success; and the purpose of the demonstrations will be to acquaint national forest permittees with the merits of the treatment.

In cooperation with stockmen, the forest service will also grub out all the larkspur on one large range on the Stanislaus national forest. During the past two seasons the service has demonstrated the practicability of this method where larkspur occurs in patches and is not too widely distributed.

WHAT BAD ROADS HAVE COST

All this takes it for granted that the total products of American farms are hauled to market; but that is not true. To the frightful waste of transportation caused by bad roads must be added another sum, which represents products that never get to market at all. One of the most conservative and accurate American economists has shown by careful figures that American farmers lose nearly $1,000,000,000 each year because they cannot get what they have to sell within reach of the purchaser.

The throwing away of actual produce because of bad roads or no roads would build every year 40 permanent and perfect ocean-to-ocean highways. Astounding, is it not? So much that we produce, even with our poor methods of cultivation, never gets to market that this wastage, if saved, would build forty Lincoln Highways.

And not only would good roads throughout the nation save this billion dollars' worth of produce now wasted annually, but they would increase very largely the raising of all manner of foodstuffs and other products, because the ease of marketing would be a selfish incentive to more careful and productive cultivation. Good roads will do more to lower the high cost of living than most people think, just as bad roads have done more to create that problem than is generally supposed.—Albert J. Beveridge, in "Saturday Evening Post."

Weak Stifle

What should be done for a young mule that is weak in the stifle joint? After a day's work he drags the leg and after a struggle brings it up in place with a snap in the stifle joint. He is worse in the morning following several days' hard work.—Subscriber, El Monte.

The ligaments that hold the kneecap or patella bone in place have been weakened by too hard work. The mule should have rest. Also shower the joint with cold water. If you have city water and a hose turn a stream on the joint half an hour at a time, morning and evening. After showering it rub it dry and wet it with turpentine. That will contract the ligaments and he will soon be all right.

Washington wool growers are breaking up shearing camps and the stock are going to the hills for pasture.

Poultry for Profit

A WAY OUT

Written for California Cultivator
By James R. Henderson

JUST now the poultry business, like many others, is below par. There is not much doing. Would-be buyers have little money, and would-be sellers want more for their foodstuffs than the poultry-keeper can pay.

The pessimist is the only man who is having a rarely good time. Let him enjoy it while it lasts; it will soon be over. An enormous amount of money is being earned by this country. She has suddenly become the market of the world, but the mighty inrush of dollars has not yet reached the ordinary channels of business because most of them are being used and used again to turn out the goods that Europe shouts for. When the rush is over and the bills paid, the wealth of the country will have vastly increased and all will benefit. If you throw a brick into the middle of a pond it will make a fine splash, but the ripples take time to spread all over the water. The ripple of dollars will come to the business people of the poultry world before long, they can rest assured of that. I say business people advisedly, for there are people in the poultry business who have no sort of business about them, and if dollars do come their way they won't stick.

But, until the dollars arrive, what is to be done? Well, when food becomes so dear that the cost of production practically equals the value of the egg output, a choice has to be made of: reducing stock, trying to increase the output, saving on the food bill at the risk of smaller returns, trying to maintain the output by the use of cheaper foods and by, perhaps, different handling.

Taking these in order, the first needs no comment. The second, in some cases, might bring better return from the present outlay. Of how many poultry-keepers can it be said that they are really doing justice to their business? As to the third, well financed concerns will probably adopt this course. They will quietly lie low and say nothing, keeping the pot, not boiling, just gently simmering, till the hour of profitable business strikes again. But when I come to the fourth, I am at once reminded of the proverb, "Necessity is the mother of invention." No matter how old a custom may be, days come that set it sternly aside.

Your hens may be divided into two classes, those that get all they want with little or no effort, and those that have to work hard for a living; and, in the hen's case anyhow, enjoy working for a living. Number one class hens have food before them all day long, asking to be eaten, dry mash. So easy is life made that even the exercise yards are kept as bare as a board, for fear, I suppose, lest the flock should exhaust its energies by too much scratching. Their energies are to be carefully nursed for the sole purpose of enabling the unhappy hen to swallow as much dry mash as possible. It is a loathsome idea, really, and reminds me of the way a goose is kept before a hot fire and made to drink all the water it can, so that its liver may be brought to the proper condition for making the delicacy known as pate de foie gras. Let some one suggest that the expense and frequent waste of unlimited dry mash might somehow be avoided, and the answer will be, "Oh, but we cannot possibly do without it." The answer reminds me of what Russia must have said just lately about vodka, and France about absinthe, "Can't possibly do without it!" But those great nations have done without it, and what is more their productivity has gone up by leaps and bounds since they took to more sensible forms of nourishment. I wonder how far this popular method of feeding is responsible for the number of poultry farms that are advertised for sale? Apart, however, from the cost, how can the best results be expected from pampered, overfed stock? If only you will get your birds going, teach them to work for their food and make them live creatures, they will not only save your money but start the egg factory working overtime. The hen can do without it, dry mash, very well.

"Oh, but we can keep so many more birds by this method." So you can, but the object of keeping many or few is that the birds shall keep you, not that they shall give you the opportunity of paying a lot of good money to the miller. Why keep a great quantity of stock if less, differently handled, will bring in as much money? You can use land, time and money to better purpose than in keeping unprofitable servants.

Start then to get your birds into condition, not by food, but by exercise and work. Make those gaunt bare yards work for you by turning them over in patches and burying deep any sort of waste grain that will germinate. Keep the birds off the patch for a week, then turn them on to it and get another patch ready. Your yards will surely be exercise yards then. Keep plenty of litter in the scratching shed and see that it never fails to yield something, however little, to the diligent seeker. After a week or two your birds will have quite a different view of life; and if, in these narrow times, you cannot give them the same quality of food as usual, it will not make much difference. The man who is doing hard, regular, healthy work can convert almost any food into the required energy. So can the hen.

Take the case of one of the cheaper foods, rolled barley. I have heard it described as the food you fall back on when business is bad. In good times it seems to be looked on as "no class."

During the past winter I have had some remarkably good egg results from the cheaper foods. Try this, for instance: For the morning meal, rolled barley which has been soaked over night in water containing a small quantity of first-rate fish meal. Dry off with bran one morning, alfalfa molasses (not meal) the next, and feed. At mid-day oat screenings in the litter and all the green food you can give them. At night a small handful of corn per bird. On a diet similar to this a pen of 12 White Rocks laid 217 eggs between November 20 and December 20, last. Not so bad? There was, of course, the patch of possibilities in the yard to give an interest to life and quicken the circulation.

Alfalfa molasses is a great addition to the hen's bill of fare. Good fish meal is, I believe, one of the most valuable foods we have, and if properly used it will not taint the egg at all. The analysis of a first-class brand will be an eye opener for many people and a help to all. It is not only rich in protein, but contains a large amount of bone phosphates and ash, substances that are essential to the raising and maintaining of strong, prolific and profitable stock.

In conclusion, those who have read Pickwick will remember Mr. Weller's warning to his son, "'Ware widders, Sammy, 'ware widders." To poultry folks, I would say, "'Ware dry mash, and more power to your bank account."

This will be one of the greatest events in live stock circles on the Pacific Coast and is attracting wide attention. There are 75 registered animals to be sold.

QUESTIONS AND ANSWERS

(Continued from page 535)

bred primarily for mutton, the fleece bringing considerable revenue but not being the main consideration as with the fine wools.

The Southdown is the smallest of the medium wool breeds and is a compactly built, early maturing animal that produces a well covered carcass of high quality. Blood of this breed has been used in the improvement of many other breeds. They are not kept extensively in California or in the United States.

The Shropshire is numerically the strongest of the medium wool breeds and very popular because of its medium size, easy keeping and feeding qualities and the fact that when crossed on the Merino a good mutton lamb is produced.

Hampshires are larger than either Southdowns or Shropshires, are good grazers and produce large lambs. They are hardy and feed well.

Oxfords are the largest of the medium wools and not only a splendid mutton producer as a pure breed but particularly useful in crossing on flocks where an increase in size is desired.

Suffolks are black face sheep somewhat like the Shropshire but are not extensively bred in this country.

Dorsets are horned sheep that will produce lambs twice a year, have a good carcass and the ewes are particularly good milkers. They are much used in the East to produce "milk lambs."

Cheviots are not extensively grown in this country. They are adapted to hilly land and more rigorous conditions than some of the other medium wool breeds and produce a good carcass.

If more was known of the subscriber's problem it would doubtless be possible to give further information that would be of interest and use.—W. S. G.

Sun Dried Apples

Is there a ready market for sun-dried apples?—Subscriber, Kenwood.

Just at present the market on dried fruits is most uncertain. Sun-dried apples must of necessity be of exceptionally fine quality in order to command ready sale. They are staple, however, and presumably fine stock would find sale at a fair price.

Lemons in Santa Maria

We have in this section exceptionally fine climate though rather continuous spring winds from the ocean. Would lemons do well if sheltered from the wind? What variety is best? One in the yard which is sheltered from the wind is doing well.—Subscriber, Santa Maria.

No fruit tree does its best in strong winds direct from the ocean. Would suggest that the trees be protected by windbreaks. However, a trial may show them to be unnecessary. In the Santa Barbara section there are wonderfully fine producing lemon orchards without windbreaks on slopes looking directly down on the ocean.

Late Blooming Pears

Regarding late blooming pears, J. W. Mills gives the following: Doyenne Comice, two days later than Bartlett; Flemish Beauty, six days later than Bartlett; Beurre Hardy, four days later than Bartlett; Sheldon, four days later than Bartlett. These are from two to six days later in blooming than the Bartlett. As to their market value there is some question about planting them in any quantity.

Egg Eating

What is cause and cure of egg eating?—Subscriber, Terra Bella.

Egg eating nearly always begins with a broken egg. The egg may have been dropped from the roost at night; it may have been broken on the nest by two hens crowding on together; or it may have been merely cracked in the nest, and rolling from under the hen, have attracted her attention. Most hens like egg meat, and if they once get a taste will taste again. Sometimes a badly shaped nest is largely to blame. When the nest is flat instead of concave the eggs roll out, and the hen, having nothing better to do, pecks at them. If she finds a crack or the shell is very thin the mischief is done. As in many other things prevention is the best cure. The nests should be as dark as possible so that the hen will not notice the eggs if they should roll from under her. They should also be either just barely large enough for one hen, which is about 14 inches square, or so large that two hens may occupy them without crowding. Some experts have thought the latter size best. Sufficient litter to keep the nest in its proper rounded shape is an absolute necessity if this habit is to be prevented. Once the habit has been formed it may usually be broken by transferring all nests to a room so dark that the hens can barely see to enter the nests. If the guilty fowls are known, and they may often be detected by the egg-yolk on their bills, they may be put by themselves where they must lay in the dark. Some poultrymen recommend the use of a "doped" egg, that is, an egg filled with a mixture of whiting, mustard and pepper, or some other disagreeable substance, the whole being moistened with linseed oil to which a few drops of eucalyptus oil have been added, but the dark-nest method is best.

Breaking Up Turkey Hens

I have lost several hen turkeys just after being broken up from broodiness. They refused to eat and in a few days died. In no case was violence used; they were simply kept from their nests. I would like to know if it is a usual thing that a hen turkey will not survive being "broken up," and if it is the usual practice to let them set the first time they want to?—Subscriber, Arroyo Grande.

I never heard of such a case and I cannot help thinking there was some unsuspected disease which accounted in part at least for the death of these hens. So far from its being customary to set turkeys as soon as they become broody, the custom is exactly the reverse. The eggs of the first and second clutches are usually set under chicken hens, and the turkey hen is not allowed to sit until she has laid her third clutch. I would suggest that next time you have occasion to break up a turkey hen, instead of destroying her nest you confine her, either in a slatted coop, such as is used for chickens, or in a covered pen. See that she is well fed with what she likes best and keep her confined till she begins to lay again or you have other proof that the broody spell has passed. If she begins to droop let her go back to the nest and see what the result is. I do not know why a turkey should grieve because her nest is destroyed more than when she is kept away from it, but the case is very interesting and worthy of investigation. I should also look for lice and for any symptoms of a disturbed liver.—J. A. K.

THE SALUTATION OF THE DAWN

Look to this Day—
For it is Life, the very Life of Life.
In its brief course lie all the
Realities of your Existence:
The Bliss of Growth;
The Glory of Action;

The Splendor of Beauty.
For Yesterday is only a Dream,
And Tomorrow is only a Vision;
But Today, well lived, makes
Every Tomorrow a Vision of Hope.
Look well, therefore, to this Day
—Text from the "Sanskrit."

RAISIN RECIPES
Continued from April 22

Raisin Veal Loaf

One pound can of veal or two pounds of cooked veal; add minced onion, two beaten eggs, cup of dry bread crumbs, three-fourths cup of milk or cream, rounding teaspoon of salt, dash of pepper, and one cup of plump raisins, which adds very much to flavor. Mix thoroughly and press into oblong pan which is well buttered, bake 30 minutes. Serve garnished with parsley.—Miss R. Crawford, Pomona.

Raisin Pudding

Cook together one and one-half cups of raisins (Muscats with seeds in are better for this), two-thirds cup of sugar and two cups of water until the juice is thick and rich. Remove from fire and cool. Into a pan about five inches deep and eight or nine inches across put raisins with juice and sprinkle over them little chunks of butter, about a teaspoon in all. On top of this pour a batter made as follows. Two-thirds cup of sugar, one tablespoon of butter, one cup of sweet milk, one egg, two cups of flour sifted with three teaspoons of baking powder, beat as for cake, but do not use any flavoring as the raisins will flavor it. Bake in moderate oven about 40 minutes. This makes a very large pudding and for a small family may be served as a new dish for several days by changing the sauce served with it: Sweetened milk, whipped cream with chopped raisins, or cooked sauce like the following: One pint boiling water, one tablespoon of butter, one-half cup of sugar and one teaspoon of flour. Cook together two minutes. This will keep moist a week by keeping covered with a fitted lid after removing what you want each time.—Mrs. Reece Lambert, Whittier.

Raisin Whip

Whip one pint of heavy cream to a froth. Add two and a half ounces of powdered sugar. Dissolve three-quarters of an ounce of gelatine in a little warm water and strain it into the cream, beating it rapidly. Next add one cup of well cooked seedless raisins, mixing thoroughly. Place in molds and set in well salted shaved ice until set and partly frozen. Next place prepared raisins on oblong dish covering bottom and the already prepared mousse in center with a lady-finger at each end and decorate with whipped cream and raisins. This raisin whip is calculated to tickle the palate of any one.—Mrs. A. G. Unland, Hemet.

Raisin Whip

To the whites of three eggs beaten very stiff add one cup of seeded raisins chopped fine, fold into the whites carefully. To be served with a boiled custard sauce. Made from yolk of three eggs, one pint of milk, one-half cup of sugar, one level tablespoon cornstarch. When cold flavor with vanilla. To be eaten cold.—Mrs. M. A. Dennis, Lankershim.

Raisin Pudding

Take three cups flour, one pound raisins, two eggs, one and one-half cups of suet, two teaspoons of baking powder, one and one-half cups of sugar and milk enough to make a stiff batter. Tie loosely in cloth and drop in boiling water. Boil from one and one-half to two hours, or spread a cloth on a steamer, and pour the pudding on it. —Mrs. Birdie A. Jordan, Reedley.

Raisin Turnovers

Two cups flour, one cup seeded raisins, two teaspoons baking powder, one teaspoon salt, one tablespoon butter, two tablespoons lard, three-fourths cup milk; one-half cup granulated sugar. Sift flour, salt and baking powder into bowl, add lard and rub in lightly, add milk enough so it can be rolled out one-half inch thick, cut in four-inch squares, brush with melted butter and put two tablespoons raisins in each turnover in a three-cornered shape, brush top with milk and sprinkle with sugar, bake in moderate oven about 30 minutes.—Mrs. D. M. McPherson, Los Angeles.

Raisin Pie

Bake a rich under crust. For the filling, chop two cups raisins and bring to a boil in one cup milk. Thicken with two eggs beaten with two tablespoons sugar. Add one teaspoon vanilla. Fill crust and set in oven a few minutes till firm. When cool, cover with whipped cream.—Mrs. W. Piru.

Raisin Pie

Beat together one cup sugar and the yolks of three eggs until very light and creamy; add one cup sour cream, one cup seeded raisins, one cup chopped walnuts and a little salt; mix well, then fold in the well beaten whites of the three eggs flavored with one-half teaspoon lemon and one-half teaspoon vanilla. Bake with one crust until nicely browned. This will make two pies.—Mrs. H. R. Franck, Clovis.

Raisin Pie

One cup raisins, three-fourths cup sugar. one and one-fourth cup water, juice of one lemon, four crackers rolled fine. Put raisins on to cook in the water and when thoroughly done add other ingredients. Bake between two crusts.—Mrs. Henry C. Simkin. Pasadena.

California Cookies

Clean and wash two pounds seeded

FRUIT CAKE

A Simple Recipe That Is Proving Immensely Popular

One of the most favored desserts in general use is Fruit Cake. Yet very few are able to make as satisfactory fruit cake as they would like. This is probably due in many cases to some fault in the recipe, although a little change in some of the ingredients used often produces surprising results. For instance, most recipes for Fruit Cake call for the use of molasses to a greater or less extent. It has been found, however, that a much better cake can be made by using Karo Syrup instead. The next time you bake try the following recipe for Fruit Cake which has become the favorite with thousands of good cooks:

1 cup brown sugar; 1 cup butter; 1 cup milk; 2 cups Karo Syrup; 1 tablespoon each cinnamon and cloves; grated nutmeg; 4 eggs; 4½ cups flour; ½ cup Kingford's Cornstarch; 3 teaspoons baking powder; 1 cup each raisins and currants well floured.

Beat the butter, sugar and Karo to cream. Add the eggs, well beaten, the milk alternately with the dry ingredients sifted together and the spice. Turn fruit last. Bake in a very moderate oven one hour. The Karo Syrup and Kingford's Cornstarch can be found at all good grocers.

raisins, put through a coarse food chopper and set aside. Make a dough of two cups sugar, two cups lard, one and one-fourth cups water, four cups flour, three heaping teaspoons baking powder (more flour will be required for rolling out, but the dough must not be too soft.) Cut with cookie cutter and fill a baking pan. Cover each evenly with raisins and put on top another cookie. Flavor with lemon. These are well worth the trouble.—Mrs. B.

Cookies with Raisin Filling

Beat to a cream a cup of sugar and one-half cup of shortening. Add one-half cup of sweet milk, one egg and three and one-half cups flour with three teaspoons of baking powder. For filling, mix three-fourths cup of sugar and one tablespoon of flour. Add one cup of boiling water and one cup of chopped raisins, cook till thickened. Roll cookies very thin. Cut out, place in pans, put one heaping teaspoon of filling on each cookie; place another cooky on top and bake.—Mrs. W. H. Proctor, Laton.

Make Your Own Pastry Flour

A Simple Method of Insuring Delicious Pastry

A prime requisite in the preparation of satisfactory pastry is a perfect flour. It is not generally known that the housewife can prepare her own pastry flour by mixing cornstarch with regular bread flour in the proportion of one part of cornstarch to from three to five parts of flour—which can be regulated by the housewife herself according to the amount of gluten in the bread flour she is using. This varies very materially in different parts of the country, according to whether winter or spring wheat flour is used—and even these flours vary.

The addition of the cornstarch to wheat flour reduces the amount of gluten, and makes a soft, fine texture—eliminating the tendency to toughness in cake making, etc., where straight wheat flour is used.

In order to insure the best possible flour, however, it naturally follows that the best cornstarch obtainable should be used. Many thousands of successful cooks in all parts of the country are using Kingsford's Cornstarch in this manner with most satisfactory results.

No one can realize all the possibilities in good cooking without a thorough knowledge of the use of cornstarch. A little booklet on the subject has been gotten up by the manufacturers of Kingsford's Cornstarch. Ask your grocer for one of these books today and try some of its numerous recipes—but be sure it's Kingsford's.

DAISY FLY KILLER placed anywhere, attracts and kills all flies. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 6 sent by express prepaid for $1.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

The Ant Nuisance

No Need to Suffer Longer From This Annoyance

Many a woman suffering from a house overrun with ants will learn with intense relief that a remedy has been discovered that will not only rid a house but do it almost instantaneously.

This remedy was originated by a baker in Los Angeles who was almost driven out of business by ants overrunning his establishment. After long experimenting he devised a paste which appears to have almost supernatural powers as far as ants are concerned. It required only one day for him to rid his shop completely of the pest.

So efficacious did it prove that it has been put up for general use under the name of Kellogg's Ant Paste, and placed on sale at all good druggists. Failure is impossible with this remedy.

Try a package today and your ant troubles will be a thing of the past; but be sure it's Kellogg's.

Raisins and Prunes

Two heaping cups prunes, one level cup seedless raisins, one-half cup sugar, one slice of lemon. Wash prunes in hot water, put to soak in cold water for several hours or until they begin to swell, add raisins and sugar and lemon and cold water to cover fruit about one inch, stew until raisins are plump and tender. If fireless cooker is used, the prunes need not be soaked. Put all ingredients together, add water to cover fruit about one inch, bring to a good boil, and put in cooker over night. They are then ready for breakfast.—Mrs. J. H. Friend, Ontario.

Our Favorite Raisin Cake

This cake is without milk, butter or eggs. Put one cupful of water in a saucepan, add one cupful of brown sugar, one-third of a cupful of lard, two cupfuls of seeded or seedless raisins, one teaspoonful of powdered cinnamon, one-half teaspoonful of powdered cloves, one-quarter teaspoonful grated nutmeg, boil three minutes. Cool and add a pinch of salt, one teaspoonful of baking soda dissolved in two tablespoonfuls of warm water, two cupfuls of sifted flour and one-half teaspoonful of baking powder. Mix and turn into a buttered and floured cake tin. Bake in a slow oven.—Mrs. J. E. Dietrich, Kingriver.

Economical Raisin Cake

One cup of sugar, one cup of cold water, small half cup of fresh lard, one cup of seedless raisins, one teaspoon each of cinnamon and cloves, one-half teaspoon each of nutmeg and salt; put in a saucepan on stove and boil together four minutes. Then take from stove, set away to cool. When cold add one and three-fourths cups of flour in which has been sifted one level teaspoon baking soda. Mix well and bake in a loaf in a moderate oven. When cold frost with a boiled frosting. —Miss A. Strube, Elk Grove.

Raisin Bread Cake

Two cups of bread sponge, two eggs, two cups of sugar, one cup of melted lard, three cups of raisins, one teaspoon of cloves, one teaspoon of allspice, one teaspoon of soda, flour for a stiff dough. Mix the ingredients with the bread sponge in the order named, adding the soda last after sifting it twice with the flour. Let rise for an hour and bake in a slow oven.

This is delicious and in our estimation it is the equal of fruit cake. When cold, can be frosted with a white boiled icing, which gives it a nice finish.—Uradel A. Bruce, Dehesa.

Raisin Cream Cake

One cup sugar, one-fourth cup butter, two cups flour, two eggs, one-half cup milk, one teaspoon baking powder. Cream butter and sugar; add eggs and beat well. Add milk and then flour into which the baking powder has been sifted. Bake in two or three layers.

Filling

One-half cup thick sour cream, one cup sugar, one cup seeded raisins, chopped, one egg. Flavor with vanilla. Mix sugar and cream, add raisins and yolk of egg, and flavoring. Beat white of egg, add to mixture, and spread between layers. Cover top of cake with any good icing.—Mrs. E. S. Ross, Olive.

Raisin Cake

Three cups of sugar, three-fourths of a pound of butter, one pound of flour, one-fourth pound of citron, two pounds of raisins, two pounds seedless currants, ten eggs, two teaspoons of baking powder, one teaspoon each of mace, allspice, cinnamon and cloves. Beat the butter and sugar to a cream, then add the beaten yolks (whites beaten separately), stir in the flour, baking powder and then add the spices. Have the fruit all cleaned, dried, well mixed and floured, then add to the dough. Bake two hours or until well done. This will keep a year.—A. E. Escondido.

Fruit Cake

One cup of brown sugar, one cup of shortening, one egg, one cup of sour milk (or buttermilk), one cup of seeded raisins, one level teaspoon soda

At the Exposition

When you visit the Panama-Pacific Exposition, look for the Exhibit of New Perfection Oil Stoves and Heaters in the Palace of Manufactures. Let the Demonstrator show you how efficient a good oil stove really is.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

It has abundant heat—always ready—like gas. It bakes, broils, roasts and toasts like a regular wood or coal range—but without dirt or ashes. No odor. Does not taint the food. Does not overheat the kitchen. Especially good for hot summer cooking. Made in several styles and sizes. Ask your dealer.

STANDARD OIL COMPANY
(California)
Los Angeles

Buy Telephones for Telephone Service

THERE is as much difference in telephones as in automobiles, and they should be bought as carefully. You want to use a phone giving reliable service. Cheaply made phones sometimes give good service for a week or a month; then trouble begins. Repair bills make cheap phones costly. Voices come over the wire faintly. Many sounds do not get over at all.

With a Kellogg Telephone repair bills amount to nothing. After years of use you can hear a watch many miles away tick loudly and clearly. They are so strongly and simply made that everywhere among users of telephones the name Kellogg has come to stand for ideal telephone service.

Kellogg Telephones Stand for Service

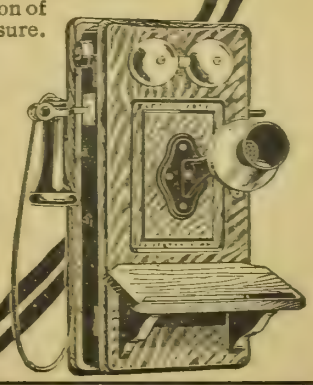
They are made in the largest independent telephone factory in the world. Every instrument passes 37 rigid tests before it is shipped. You have day by day the satisfaction of using a phone that makes telephoning a pleasure.

We have an expert department costing us $100,000 a year that is maintained for telephone users and those who are starting new lines. Why not put your problems before these experts? The service costs you nothing. You cannot fail to get information that will save you time, money and trouble.

Get your name on our books to receive valuable bulletins and other telephone literature that we send free.

Write for Bulletin 24.

KELLOGG SWITCHBOARD & SUPPLY CO.
Mission and Third Sts. San Francisco, Cal.



APOLLO ROOFING

Corrugated, V-Crimped, Standing Seam, and all standard patterns of Formed Roofing and Siding Products—specially adapted to all classes of farm buildings. Made from the well known APOLLO Best Bloom Galvanized Sheets. Sold by weight by leading dealers. APOLLO Best Bloom Galvanized Sheets are also unexcelled for Culverts, Silos, Tanks, Cisterns, etc. Our booket "Better Buildings" sent free.

AMERICAN SHEET AND TIN PLATE COMPANY, General Offices: Frick Building, Pittsburgh, Pa.

FRUIT GROWERS HEADQUARTERS

When in Los Angeles, stay at Hotel Clark. Ideal location. One-half block from Central Park. Close to all stores. Extremely reasonable rates. 555 rooms with bath. Excellent grill service—popular prices.

Hill Street Between 4th and 5th.

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, May 5, 1915.

The prices given below, except where otherwise noted, are those made by wholesale or commission houses to retailers, and are intended to give producers the range of the market rather than an indication of prices which they will secure. Jobbers' quotations to producers are not given.

BUTTER

Prices to trade 3 to 4 cents above following quotations:

Citrus Fruit Market

LOS ANGELES, May 5, 1915.

The freak rain is playing havoc with orange picking. There are two counts against it: first, when picking is begun it is very probable there will be serious trouble with decay and extreme care will be necessary in handling the fruit. Still worse, people in the East are being deprived of fruit just when the growers wish to pick it, for they are concerned as to its keeping. Several hundred cars which are now in the market or on the way are offered a good opening because of this holding back of fruit making a comparatively bare market. The good prices now being offered is causing an itching on the part of the Valencia growers, and presumably they will soon begin shipping. If they add too great a quantity to the Navels yet to go it is possible low prices may obtain for a few days. There are something over 2000 cars of Navels yet to go. Two weeks of good weather will easily clean these up, then Valencias will have the principal call in the market. There are perhaps 10,000 cars of Valencias to be marketed before November 1st.

At the present time there is an immense quantity of lemons in the store houses and packing houses of California. There are at least 3000 carloads. The warm weather of the East aided in cleaning up everything at the Eastern end, and these 3000 carloads will be shipped, weather permitting, very rapidly from now on. In addition, there will be fairly heavy spring cutting.

Shipments

Shipments of oranges from Southern California since November 1, 1914, 20,659, lemons 2,856, total 23,515; to same date last season, oranges 21,868, lemons 1,219, total 23,087. Total shipments from Tulare County, oranges 5,232, lemons 192, total 5,424; last year same date, oranges 4,679, lemons 30, total 4709. This year's shipments from Butte and other Northern California points, oranges 628, lemons 1, total 629; last year same date, oranges 398, lemons 5, total 403.

NEW YORK, May 3.—Thirty-nine cars navels, ten mixed, and two cars lemons sold. Navels and lemons higher.

high grade material-low weight low operating cost

Ever put a piece of steel and a piece of cast-iron capable of bearing the same strain, on the scale? Quite a difference in weight, was n't there?

Steel is used wherever possible in The Yuba Ball Tread Tractor. The strength is there, the power is there, but the useless, bulky, power-consuming dead weight is eliminated. The machine is compact and free from frequent break-downs.

THE YUBA BALL TREAD TRACTOR

Low weight, aided by elimination of friction, and saving of fuel and lubricant, cuts the operating cost of The Yuba Ball Tread Tractor to a remarkably low figure.

There is a booklet containing a lot of interesting information on that subject. A request brings it.

Profitable Farming

G-E Electric Motors are increasing profits for hundreds of farmers by saving money in running irrigation pumps and doing "chores".

A G-E Motor is always ready to run when you throw in the switch and costs very little to operate. The absence of fire risk is a big advantage of electric power. Some of the other advantages of electric motors are:

Only one moving part and two bearings—run for years without a moment's trouble.

Can be set wherever a wire will go—on the wall, ceiling or floor. They occupy less space and have less weight than any engine of equal power.

Capable of higher and more constant speed than any engine.

Require no attendant and can be stopped and started from miles away if desired.

Are safe and sure—no water to freeze—no inflammable gases—no starting troubles—JUST THROW THE SWITCH.

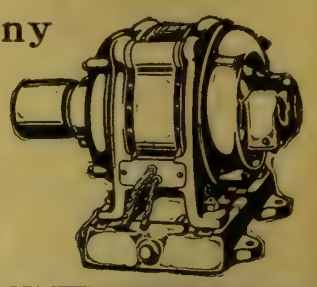
Let a G-E Motor increase *your* profits.

Ask your local power company or our nearest office

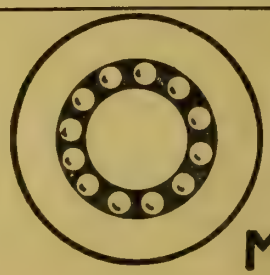
General Electric Company

Los Angeles Office:
124 West 4th St.

San Francisco Office:
Rialto Building



The General Electric Company will gladly answer all questions relating to the use of electric power for ranch and market garden irrigation. 5479



When you use Mica Axle Grease it's just like putting ball bearings on your wagon.

MICA AXLE GREASE

gives *better* lubrication. It's a combination of high-grade grease and powdered mica. The mica is also a good lubricant and has the power to resist heat and wear. It makes the spindle smoother and the grease last longer. Dealers everywhere.

Standard Oil Company
(California)
Los Angeles

Thornburgh SIDE DELIVERY BUNCHER AND WINDROWER

Make more money on your clover, alfalfa, timothy, peas, flax, vetch, soy beans—all short grain crops, by using the **Thornburgh Side-Delivery Buncher and Windrower.** Save waste of time, seed, fodder. Chalmers, Oregon, writes, "Best assistance I've had in 16 years. Cuts a third more acres in half the time, cuts clean, puts hay in shape for quicker loading, turns it out of horses way, no waste of seed."

Easily Attached to any Mower Leaves crop in either loose bunches or windrows. Heads and leaves in center, stems out to dry quick. Saves seed and leaves. No raking or tedding. Buncher can be folded for moving, not necessary to detach. **Thornburgh Bunchers used in every state.** Positively warranted to work right. Costs little—pays for itself every day. Write for catalog. Mention dealer's name. Write nearest distributor or to us.

CALIFORNIA CULTIVATOR

Rural Californian combined with California Cultivator

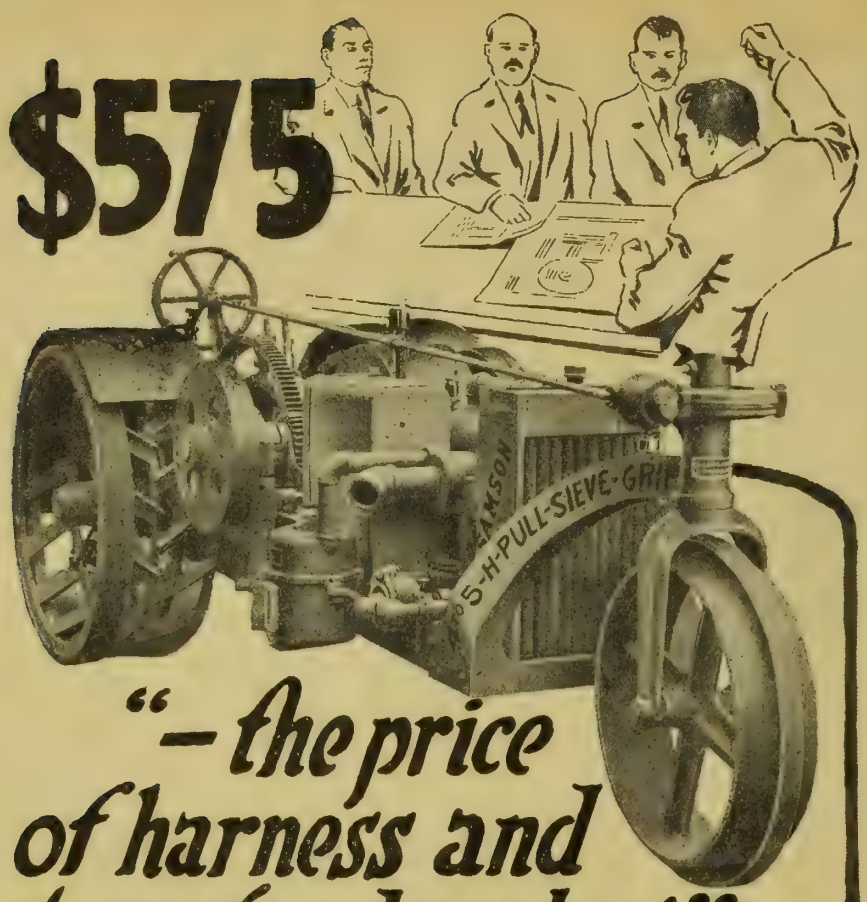
An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES May 13, 1915 SAN FRANCISCO

The World's Greatest Poultry Center

California has many large poultry ranches, the greatest being north of San Francisco Bay, especially in the vicinity of Petaluma. The larger ranches here average around 7000 birds. The one shown in the engraving is a $60,000 plant and is considered even in that great poultry center a model and remarkably fine plant. As a rule the poultry ranches in this section run about 400 birds per acre, and business principles are applied to the industry here as in no other section of the world.

$575



"—the price of harness and two good mules!"

"It can't be done," declared the chief engineer. "You asked me to design a four to five horse-pull tractor which would contain the best material, with an ample margin of safety in all its parts and a strong basic design. You said nothing about price. I followed your instructions. There are the plans and it can't be profitably sold for less than seven hundred and fifty dollars. To sell it for six hundred or less is out of the question."

He was one of a group surrounding a table covered with blue-prints and scratch-pads.

"In that case," said the president firmly, "we will not build a small tractor. A great field exists for it, true enough. The smaller acreages, twenty to one hundred acres, abound everywhere. They yield a revenue necessarily small, making close attention to economy of operation very necessary. The owner who would preserve his peace of mind must watch the leaks and do nearly all of his own work. Hired labor eats big holes in profits.

"But to be really 'successful' the machine must represent greater things than a mere saving in operating costs. The price must be low. Above all else, it must be dependable in construction, which my specifications insure. I realize that the two are difficult to combine, but more than once in our sixteen years experience in manufacturing and twelve in building tractors our reputation for building dependable products has been the very life of the institution. In times of stress we have leaned upon it as our greatest asset, while others, less fortunate, struggled against overwhelming odds. Unless the machine can be built as I have specified for six hundred dollars or less we shall not build a small tractor. We cannot and will not endanger our reputation and the confidence of the public by putting out an inferior machine."

The keenest disappointment showed in every face as the president paused. The joy of creation which these trained men had known so well for the past few weeks had been taken away.

The chief engineer broke the silence and repeated. "The designs cannot be cheapened without sacrificing strength. Unless," and his face brightened instantly——

He had struck the solution. We built the machine without a change. The price is five hundred and seventy-five dollars. The remainder of the conversation, one that actually occurred in our office, will be found in our new book, "The Price of Harness and Two Good Mules." Use the coupon to secure it free.

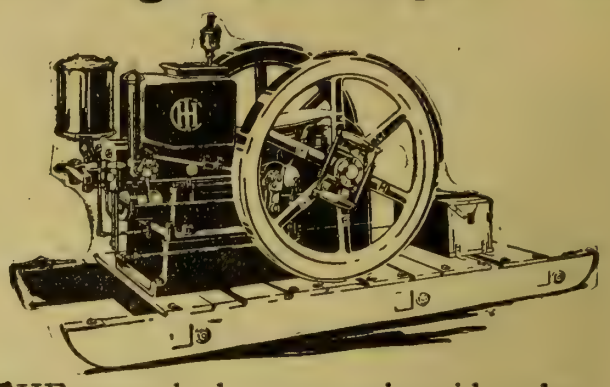
International Harvester Oil Engines—Mogul—Titan



THE man who buys an engine without knowing engines, takes a chance. He cannot know whether he has the best engine for his work or not, unless he knows engines and can make comparisons.

Our suggestion would be to take the I H C oil engine—recognized as standard in its construction; study its every feature closely, and use it as a basis of comparison when looking at other engines. That is the only way to choose correctly the best engine for the particular work you want your engine to do.

I H C oil engines—Mogul and Titan—are made in all sizes from 1 to 50-horse power and in every approved style—stationary, skidded, portable, tank and hopper-cooled, vertical and horizontal. They operate on gasoline, kerosene and even lower grade oils, and on gas or alcohol.

When you buy an I H C engine, the engine is not all you get for your money. Our service is worth knowing about. Get acquainted with an I H C engine at the place of business of the nearest dealer where they are sold. Ask him for one of our interesting catalogues or write to us for one.

Bean Culture in California

Written for California Cultivator by George W. Hendry. Bean Varieties Adapted to Different Sections and Cultural Methods Given

THE production of dry edible beans in California has increased so rapidly within recent years that it now ranks as one of the leading agricultural industries of the state. The production of this crop is not localized but has spread to the various sections where favorable soil and climatic conditions obtain. Beans have been found to be a profitable crop in localities where they have not been grown before and where bean experience is lacking, consequently many eager inquiries are to be heard from various parts of the state regarding the methods of culture which should be employed in the production of this crop.

The Bean Sections of California

There is no scarcity of land in California suitable for the production of beans, in fact the state possesses almost unlimited capacity for the production of this crop. For its best development the bean requires a somewhat humid atmosphere or one which at least is modified by ocean fogs or mists from the rivers. Consequently the bean producing areas of California are to be found on the coastal plain, in the coastal valleys, or on the bottom lands of the interior rivers. As an example of the variation in relative humidity in the different sections, an average relative humidity for the vicinity of Fresno for the month of June taken during the afternoon would be about 13, while for the coastal plain of Ventura County the corresponding humidity would be about 63, or about five times greater than at Fresno. In the vicinity of Fresno because of the low humidity the production of beans is not profitable, while in Ventura County is to be found the center of the greatest bean producing section of the state, and one which is known the world over for the production of lima beans.

The second largest bean section of California centers about the delta region at the confluence of the Sacramento and San Joaquin rivers. Adjacent to the lower reaches of these two rivers is some 20,000 acres of overflow land devoted to the production of various kinds of dry beans. The land tributary to Ryde, Rio Vista, Courtland and Walnut Grove is included within this section.

Practically all of the Sacramento Valley bean land is to be found bordering the river. Back from the river even a short distance beans do not thrive well. The University farm located at Davis, Yolo County, is only about ten miles distant from the Sacramento River, yet the ordinary varieties of commercial beans do not yield satisfactorily at that place even on the best soil and under the most careful management.

Bean Varieties

The principal commercial varieties of beans grown in California are the Lima, Pink, Large White, Blackeye, Bayo and Small White. These varieties do not succeed equally well in all localities and the choice of a variety depends largely upon the local conditions.

Lima

The Lima is one of the most exacting beans and is not grown to perfection outside of a comparatively limited area skirting the coast of Southern California. It is more sensitive to frost than the common bean and requires a longer growing season. A hot dry wind at blossoming time is fatal to the Lima, and it will fail to set pods where the relative humidity is low.

Pink

This is grown quite generally in all of the bean sections of California. It is a hardy bean and is capable of withstanding a moderate amount of drouth and hot weather and will produce fair crops in situations too trying for most of the other varieties.

Large White or Lady Washington

The most popular bean in the Sacramento and San Joaquin River Valley section. It normally produces large leafy vines of semi-trailing habit of growth and requires a rich soil well supplied with moisture for its best development. It is non-productive under conditions of heat and drouth.

Blackeye

The so-called blackeye bean is in reality a cow pea and botanically is quite different from the other beans here described. The vines and leaves are larger and coarser than those of common beans, and the pods are longer and more irregular in shape. It is grown in all of the bean sections of California and has the widest range of adaptation of any of the commercial varieties of beans. The greatest part of the blackeye crop comes from the San Joaquin Valley, but it is also grown extensively in Southern California, in the coastal valleys of central California, and in the Sacramento Valley. It withstands the heat of the valleys remarkably well, even better than the Pink, and where irrigation water is available it may be grown successfully under very trying conditions. Because of its large vines it is sometimes used in orchards as a summer green manure crop.

Bayo

The Bayo is the most fastidious of the bean varieties. It is not grown extensively and its production is confined to a limited area of the choicest river bottom land in the Sacramento and San Joaquin valley section. It is an early maturing variety but has proven a complete failure when attempts have been made to grow it away from the immediate vicinity of the river.

Small White or Navy

This is a late maturing variety extremely sensitive to heat and drouth and requires a cool humid climate for its best development. It finds its ideal environment in the cool coastal climate of Monterey, San Luis Obispo and Santa Barbara Counties. Because of its hard seed coat it is an excellent shipping and cooking bean, and large quantities are shipped from California to Boston where they are prepared and marketed as "Boston Baked Beans."

Bean Soils

The bean is not an exacting crop in its soil requirements. Good yields are produced on all classes of soil, ranging from sandy loams to stiff clays and the peat soils of the delta region produce large yields of good quality beans. The ideal soil for bean growing may be described as a deep, rich, mellow, sandy loam; such soils are to be preferred to the heavier types because of obvious cultural advantages. Bean soil must have the capacity to retain sufficient moisture to carry the crop to maturity, for it is not customary to irrigate beans in California and ordinarily no rain falls from planting time until harvest. Very light sandy soils are not retentive of moisture and dry too rapidly, with the result that the plants may suffer from drouth before the crop has been made. Such soils when underlain with a more retentive subsoil at a depth not too great for the roots to reach are well adapted to bean growing. A stiff adobe soil may produce a good crop of beans but because of the difficulty of tilling such soil it is not suitable for commercial enterprises. The subirrigated soils, although usually considered the best bean soils, often contain too much moisture for the best results, causing the plants to make an excessive vine growth at the expense of seed production and to prolong their growth until so late in the fall that the crop is damaged by the early rains before the crop is ready to harvest. Varieties which are naturally inclined toward late maturity are subject to injury from early frosts on such land. The Blackeye and the Lima are of this class.

Newly broken tule land is often found to be slightly acid in its reaction and therefore not suitable for bean growing. Such soils however are usually benefited by a season's working and it is advisable to first crop such land to potatoes and follow with beans the next season.

The bean is not tolerant of alkali even in small quantities and alkali is often responsible for a reduction in yield. In sections where alkali is present in detrimental quantities bean fields exhibit a spotted appearance, the plants on the alkali maturing earlier and turning brown while plants on adjoining areas are still green.

Preparation of the Land

No specific rules for the preparation of bean land for planting can be given because of the diversity of soil and climatic conditions under which the bean is grown. But since over 90 per cent of the beans grown in California are grown without irrigation, it may be said in general that the principles of dry farming are or should be employed in the production of this crop. The plowing and working of the land should be done at such time and in such manner that the greatest amount of moisture may be stored in the soil. The subirrigated lands are the exception to this rule and therefore have different tillage requirements.

In general the first working of the land should commence immediately after harvesting the previous crop. If the previous crop was beans this first working should consist of a thorough disking, preferably with a cut away disk. This should be done in September or possibly in October. The purpose of this working is to conserve the residual moisture in the ground and to prepare the soil for effective plowing. Plowing is the next operation and should be done as soon as the first fall rains have penetrated sufficiently to put the soil in good plowing condition. This would usually occur some time in December. This plowing should be done deeply, and under ordinary conditions 12 inches would be none too deep. Nothing further need be done to the land until spring; that is to say the land should be rough or fallow all winter, in which condition it will absorb the greatest amount of moisture.

Towards spring the land should be watched carefully and not allowed to dry to any considerable depth below the surface. In other words a soil mulch should be established as soon as possible after the winter rains have ceased. If spring working is delayed too long a considerable part of the soil moisture is lost through evaporation making it difficult to prepare a perfect seed bed. In normal seasons this spring working should be done during the latter part of March or early in April. Either a chisel or a disk harrow may be used for this operation. But since planting does not usually commence until May first or even later, there will be an interval of from four to eight weeks elapsing between the establishment of the mulch and planting. During this interval the land should be cultivated frequently, at least every two weeks. The most satisfactory implement for this work is a cultivator with unusually light draft but efficient in cutting weeds, maintaining a shallow mulch and bringing the moisture near the surface preparatory to planting. It is very essential that the moisture should be near the surface at planting time in order that the seed may be placed in contact with moist soil. If the soil has become dry to a greater depth than it is proposed to plant the seed, the land should be ringrolled prior to planting in order to bring the moisture near the surface.

Time of Planting

In no case should beans be planted until the soil has become permanently warm. Planting done before May first is considered early planting, from May first to June first, medium, and after June first, late. From a commercial standpoint early planting is not to be recommended; chiefly because early plantings are frequently attended by losses from cold, damp weather or cold rains, causing the seed to rot in the soil or stunting the growth of the young seedlings. Fields which have received a set back early in life do not completely recover, and because of their slow development it is extremely difficult to control the weeds. It is usually desirable to plow and replant such fields. For small patches however beans may be planted early in the season and by frequent hand hoeings the weeds may be held in check.

Very late planting done as late as June 15 is to be recommended under certain conditions, such for example as are found on the very moist subirrigated soils bordering the rivers. On such land early planted beans produce an excess of vine growth but very few beans. Late planted beans on such lands produce much smaller vines but the yield of beans is considerably greater and the blossoming and setting of pods takes place later in the summer and under more favorable conditions. Late planting however is only posible on land well supplied with moisture. Late planting may also be practical in other and drier situations but irrigation water must be available in order to carry the crop through to maturity. Usually one irrigation will suffice for this purpose and may best be given about July 15 or at the time of the last cultivation which usually occurs when the vines are starting to blossom. This may be accomplished by opening a furrow between each two rows, applying the water and cultivat-

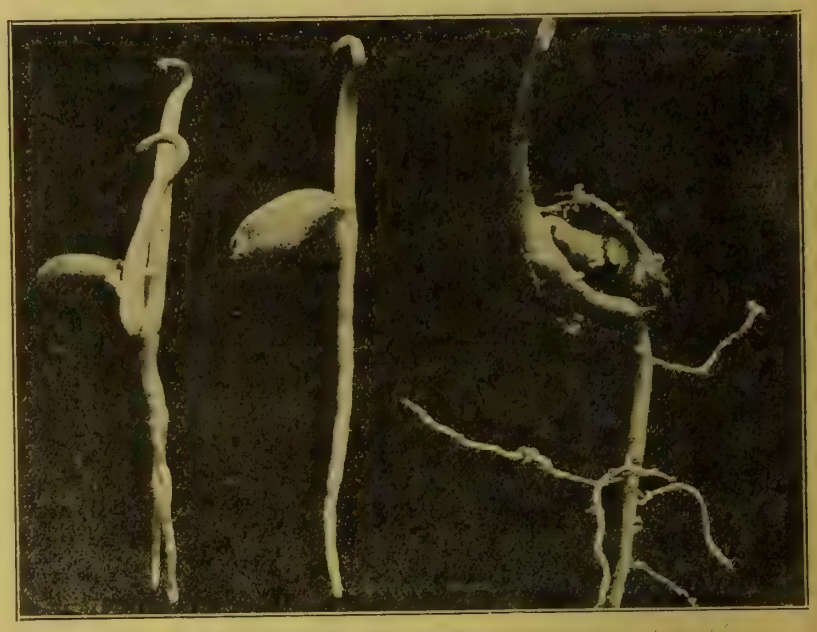
Citrus and Tropical Fruits

BENCH-ROOTING OF CITRUS NURSERY STOCK

Written for California Cultivator
By W. R. Ralston.

A VARYING percentage of the seedlings of all the species of citrus has a tendency to make a peculiar twist in the root just below and often including the hypocotyl. This often takes the form of the letter "z," and has been found to be of considerable annoyance as well as loss to nurserymen. Heretofore the phenomenon has been thought to be caused by the root striking a stone or other hard object or by some defective soil condition which prevented the roots from growing straight. Citrus seeds germinated in fine sand show many bench-roots, however, and the above theories are known to be unfounded.



SOUR ORANGE SEEDLINGS

Right, bench-root with half of seed-coat removed; center, germination of seed from which seed-coat had been removed before planting; left, polyembryony—two seedlings growing from one seed.

The writer undertook to solve the bench-root problem as a thesis, the work being done under the direction of Professor J. Eliot Coit in the greenhouse of the division of citriculture of the University of California. Counts were also made in commercial seedbeds in Los Angeles County.

In the normal germination of an orange seed the radicle tends to grow straight down while the caulicle and plumule grow straight up. This is accompanied by a certain force which in some other seeds may be tremendous. Instances have been known whereby large stones have been lifted or broken by growing plants, also there must be considerable force exerted by the germinating embryos of the hard-shelled or stone-fruit seeds.

The orange seed has a tough and fibrous seed-coat which when dry is very difficult to tear. One hundred sour seed were placed in all conceivable positions in loose silt loam which had been sifted into an ordinary seed flat and covered as usual with about one-half inch of pure sand. They germinated within six weeks and 24 per cent were found to have this peculiar bench-root curvature. After dissecting a number of the seedlings in various stages of germination the theory was advanced that the cause of this curving was the inability of the tender root tip to penetrate the tough seed-coat rather than the physical condition of the soil surrounding the seed.

In order to prove the truth or falsity of this theory 100 seed were planted after the seed-coats had been carefully removed. In four weeks (or two weeks less time than in the previous experiment) 96 percent germinated and not a single one showed the slightest tendency to form a bench-root. The accompanying cut shows some of these seedlings.

Thus it would seem that, although some seeds exert a tremendous pressure in liberating themselves from the seed-coat it is not the case with the citrus seedling. Apparently they have a very weak radicle which is very sensitive to any obstruction which will tend to keep it from the normal course. The roots however become stronger with age and can then compete with other roots. In the illustration the seedling on the right shows a mild form of bench-root. The radicle grew under the seed-coat but succeeded in breaking through at the opposite end. In many cases the root will grow all the way around, forming a loop before extricating itself and starting downward. This results in the worst form of bench-root.

It was also noticed that the seeds which were polyembryonic were much less liable to bench-root. Twenty-five of the seeds in the first planting gave rise to more than one plant each, yet out of the 24 bench-rooted plants only two were polyembryonic. This was due to the fact that instead of the force of one radicle there is the combined effort of two or more to penetrate the seed-coat.

Of course it is impracticable to attempt to remove the seed-coat before planting in the nursery, but it has been found that soaking from 24 to 36 hours in water or even using fresh, wet seed will reduce the bench-roots 15 per cent. One hundred seed were taken from the same lot of sour oranges and planted immediately so that there was no drying. The number of bench-roots was ten instead of 24 as in the previous experiment in which seeds had been kept out of the fruit a few days before planting.

The crook in the roots lowers the vitality of the trees. In some of the plants the curvature is so abrupt that it would seem a physical impossibility for the sap to make this turn with anything like the rapidity which is required in the adult tree. It is a common practice among nurserymen to throw out only those bench-rooted seedlings which are the worst and to transplant to the nursery rows those which are only moderately deformed. Trees with such bench-roots may grow and bear good crops for some years but eventually they will begin to fal off in vigor and in yield.

Therefore in buying nursery stock and budded trees the roots should al ways be examined and those with bench-roots refused. Balled trees can not be inspected and many badly de formed root systems are planted unde cover of the ball. Bare-rooted tree are easily examined and are to be pre

ferred on this account, although there are many other points in favor of balled trees.

CITRUS FRUITS

"Citrus Fruits, An Account of the Citrus Fruit Industry With Special Reference to California Requirements and Practices and Similar Conditions," by J. Eliot Coit, M. S. A., Ph., D., Professor of Citriculture in the University of California, published by the Macmillan Company, New York, $2.00. The Cultivator will be glad to secure the book for its subscribers at the above price or, including a year's subscription to the Cultivator, at $2.75.

In his preface Dr. Coit says:

"The citrus industry has now reached a high state of development in both California and Florida. Furthermore, it is progressing with rapid strides. Old World practices and precedents have been largely ignored in the development of an industry characteristically American in spirit and new in methods. The readiness with which the growers adopt new and better methods is an indication of the virility and youthful vigor of this new industry.

"The literature has hardly kept pace with the industry and is scattered through a large number of periodicals and reports. On this account, it is largely unavailable to those who need it most. The last comprehensive work published in California was that of Lelong in 1902. This quickly ran out of print and for the last six years has been rare.

"The present volume represents an attempt to discuss underlying principles in such a way as to emphasize the importance of certain stable fundamentals upon which the rapidly changing superstructure is built. It has also been the aim to describe the industry as it exists today and bring together in orderly arrangement all the information available at this time which is worth while."

There are 25 chapters in the book, the last of which contains nearly 50 pages of bibliography. Practically everything ever published on the citrus industry is referred to in this chapter. Other chapters touch upon history and development of the citrus, botany, geography and climatology of California, varieties, nursery, inspection and quarantine, improvement, judging the citrus, selection of site and planting, cultivation, irrigation, pruning, orchard heating, picking and packing, by-products, marketing, diseases, insects, and fumigation.

Stable manure never contains more plant food than on the day it is made. The plant food may become more available through chemical action, but there is more or less loss the longer the manure is kept.

GRAPEFRUIT JUICE EASILY BOTTLED.

A simple method of bottling the juice of grapefruit for use in making acid beverages is advocated by the United States department of agriculture as a means of gaining a useful by-product from hundreds of thousands of cases of grapefruit which now are wasted. An investigation was undertaken at the urgent request of Florida grapefruit growers who reported that the market during the season would not take up a large proportion of the grapefruit crop and asked the department to determine the possibility of utilizing the fruit or its juice in some profitable way.

All that is necessary, according to the government's fruit juice specialists, is to bring the grapefruit juice to the boiling point in a porcelain-lined or enameled kettle, pour it while still hot into bottles which then are hermetically sealed. The juice when so handled will keep indefinitely and provides a base for grapefruit-ade or other acid beverages having the characteristic acid, somewhat bitter, flavor of the fruit. Experiments show, however, that it is highly important that the bottle be completely filled so that no layer of air be left between the top of the juice and the cork or seal. Where air in any amount comes in contact with the top of the sterilized juice it will cause the juice to change its color. In handling the juice it is particularly important that it be kept from coming into contact with iron or other metals easily acted upon by acids.

The investigators found also that it was possible to freeze the grapefruit juice into solid ice and then by whirling the ice in a centrifugal machine to take out a large part of the water and leave the solids and flavoring matter of the fruit. This freezing and concentrating of the juice greatly reduces the bulk and makes a product which can be sterilized by heating and kept indefinitely. Care must be taken to keep the juice from coming in contact with iron.

Those who wish to make a clear juice may filter the grapefruit juice before it is heated by adding to it from two to three per cent (about three ounces avoirdupois to the gallon) of infusorial or Fuller's earth well washed with hot water. The mixture is then forced through a non-metallic filter press and the clear juice reheated and boiled. With the freezing process the juice is filtered after concentration, about twice the amount of infusorial or Fuller's earth being used per gallon of concentrate.

The chemists, in connection with this bottling of grapefruit juice, notify the public that the same process is not suitable for bottling the juice of oranges and lemons, which will not retain their flavor if handled in this way.

While as yet as far as known there is no commercial market for sterilized grapefruit juice, it is believed that many persons will find this juice, with the addition of water and sugar, a pleasant variation from lemonade or limeade. Those who like grape fruit should find the beverage inviting. The method is so simple that those in regions where grapefruit are cheap and plentiful can prepare this product on a small scale with ordinary household appliances.

American fruits are marketed in all parts of the world. Our apples, the exports of which have ranged between 6¾ million and 10 million dollars in the last decade, are sent chiefly to Europe, and our dried apricots to Europe, North America, and Australia. Most of the oranges and lemons which we export are sent to Canada, and smaller amounts are distributed in many countries. Canada, Germany, England, France, the Netherlands, Australia, and New Zealand are the best market for dried peaches, while the United Kingdom, Canada, and other British territories take most of our exported pears. American prunes are shipped principally to Europe and Canada and considerable quantities to the Orient. Canada takes about three-fourths of our exported raisins, while New Zealand buys between one million and four million pounds annually. The exports of canned fruits are chiefly to England, with smaller but important shipments to France, Germany, Canada, Cuba and Central America.

INSURE YOUR SEED

Get a "catch", a good stand, and a big yield of ALFALFA, BEANS, Peas, Vetch, and *all other Legumes*—inoculate with

The Improved German Soil Inoculator, Nobbe-Hiltner Process
NITRAGIN
PURE CULTURE
Gold Medal St. Louis 1904
THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES

In half-acre, 1-acre and 5-acre cans

Inoculated ALFALFA Not Inoculated

"NITRAGIN" is the *original* Pure Culture—*a granular* medium (*not* a jelly)—nothing to break or spill—packed in a ventilated can, containing millions of surfaces, supporting billions of nitrogen-gathering germs, their health, strength and virility

Guaranteed for Six Months by the Armour Fertilizer Works.

Absolutely harmless. Easy to use. An investment—not an expense. Remember—legumes not inoculated take *no* nitrogen from the air. Inoculated legumes mean bigger yields, richer feeding value, better soil.

Pure Culture inoculation is endorsed by the U. S. Dept. of Agriculture and other authorities. Thousands of satisfied California ranchers testify to the wonderful results obtained with "NITRAGIN" — the *Original* Pure Culture.

Avoid Imitations. LOOK FOR THE ARMOUR OVAL LABEL.

Make your crop sure. Inoculate with "NITRAGIN". It can be obtained for *any* legume.

Deciduous Fruits

CROP REPORT.

REGARDING the coming season's crop of fruits George P. Weldon, chief deputy state horticultural commissioner, writes:

"The publication of the April crop condition report has been delayed for one week because of the bad weather which has recently prevailed throughout the state. It is too soon to estimate how much damage has been done by excessive rains, winds and frost, but it is now believed that this damage will not be nearly so great as was at first feared. Cherries, plums and prunes have suffered most, but to what extent will not be known until the May reports are compiled. There will be some damage to apples in the mountain counties.

"Fungous diseases of all kinds develop best during damp weather, and it is expected that scab, mildews, shothole diseases, etc., will be in evidence in many orchards after the rains are over. Notwithstanding these facts the general crop outlook is considerably better than at this time last season."

Mr. Weldon's tabulated report made up from reports from various county commissioners gives the following as to the various fruits:

TABLE NO. 1—

Siskiyou Commissioner recently appointed and no commisioner is serving in Solano County.

Figures in table indicate condition of crop in per cent, on the basis of 100 as normal.

*Crop not grown commercially.

**Horticultural commissioner has insufficient information for a report.

All blank spaces except where otherwise indicated show a failure on the part of a county horticultural commissioner to report in time, or in the required form.

TABLE NO. 2—

Estimated per cent of the total crop of the principal California fruits grown in each of the main producing counties during a season of normal production. Compiled from reports of the county horticultural commissioners by Geo. P. Weldon, Chief Deputy State Commissioner of Horticulture.

SPRAY FOR CODLING MOTH

The apple owner and the pear grower who are anticipating disposing of their crops at satisfactory prices are spraying for that pest which has cost this country millions of dollars. The codling moth has done great injury where its control would have been easy and comparatively inexpensive. We say "comparatively" for when the profit which comes from first class fruit is compared with that which does not come from inferior fruit it shows a sufficient margin to justify the expense. The campaign against codling moth was begun years ago with the old time Paris green mixture which still is effective when good material is secured. This is usually applied at the rate of one pound, or possibly one pound and a third, of Paris green to 200 gallons of water. Where the greater strength of Paris green is used it is perhaps wise to put in about five pounds of lime to each 200 gallons.

It is usually mixed with a very small quantity of water to a creamy consistency and stirred until all the dry particles have disappeared. Then it is poured into the barrel or spray tank and kept thoroughly agitated every moment until it is all sprayed out. The careless sprayer who allows it to rest for a moment and then begins spraying again without the agitation is reasonably sure to have some injured trees and some others which will bear poor fruit because of the dose not being of sufficient strength to accomplish good results.

Arsenate of lead is generally preferred for this pest and it is somewhat easier to keep mixed. The neutral lead arsenate is used at the rate of three pounds to 50 gallons of water.

There are also a number of ready-to-spray mixtures which are being used by most of our orchardists. At one time it was feared these would not be so reliable, but as a rule these manufactured products are thoroughly reliable. They should be applied according to directions accompanying the package.

Where there is danger of attacks from fungus troubles a combined mixture is often sprayed on the trees and young fruit. This usually consists of Bordeaux and arsenate mixed. It makes the additional cost but slight as to material, and of course the cost of application is no greater.

The point in spraying is not so much what is used as the thoroughness and intelligence as to time of application. For codling moth the first spraying should be about the time the petals drop from the blossoms. Then three or four more sprayings at intervals of about three weeks will give reasonable assurance of clean fruit.

Plants by Parcel Post--Postpaid

TOMATOES—Stone, Beefsteak, Dwarf Stone, Earliana—20c per doz., $1.00 per 100.

PEPPERS—Anaheim Chili, Chinese Giant—20c per doz., $1.00 per 100.

EGG PLANTS—35c per doz., $2.00 per 100.

ASTERS—All Colors—25c doz., $1.50 per 100.

CANTERBURY BELLS—35c doz., $2.00 per 100.

DELPHINIUM BELLADONNA—$1.00 doz., $5.00 per 100.

SWEET POTATOES—Yellow, 50c per 100, $3.00 per 1000.

Morris & Snow Seed Company

439 So. Main St., Los Angeles

Ideal Gopher Trap

Only Trap guaranteed to catch large or small gopher. Being round with thin edges gopher walks into trap before detecting anything in runway. Positive grip, jaws always hold. 100% efficient—catches gopher every time. Easiest to set. Far safer and surer than poisons or gas. Farmers say it's worth dozen other makes. Price 50c. If your dealer can't supply you, will be sent postpaid on receipt of 60c; two traps for $1.10; six for $3.00. Money back if not satisfied.

E. J. CHUBBUCK CO., Dept. A,

731 Market St., San Francisco, Cal.

MORE WALNUTS

Mr. O. F. Hall of Orange County calls attention to a walnut tree that is also trying for a record. It has many clusters of four and five, but he finds one cluster of seven perfect nuts, the stem being only one inch in length, and another with 12 perfect nuts on a stem two inches in length. This must be a good year for walnuts for another grower at El Monte exhibited at this office last week a twig showing eight perfect nuts.

In addition Mr. A. G. Wicklund of Moorpark, Ventura County, writes: "I have found clusters of ten nuts many times and I have before me a cluster of 13 that I picked this morning. Walnuts are selling well and a bumper crop is almost assured."

CROP ESTIMATES

Reports received from growers this week are as follows:

J. S. Rhodes, Modesto, Stainslaus County

'Cots 65 per cent of normal; Elberta peaches 70 per cent. All other varieties of peaches 100 per cent. Almonds full crop, grapes normal, plums 85 per cent.

O. S. Hofmann, San Jacinto, Riverside County

Both apricots and peaches promise big crops.

A. A. Brock, County Horticultural Commissioner, Ventura County

As to the apricot crop, in some parts of the county it will be less than 50 or 60 per cent of normal, while in other parts there will be 85 to 90 per cent, so on the whole I feel there will be about 75 per cent of the apricot crop this year. About 110 per cent walnut crop and 100 per cent grain and hay.

SHASTA COUNTY ORGANIZATION

At the annual meeting May 5 of the Shasta County Cured Fruit Association the following were elected directors: W. J. Hill, S. G. Roycroft, F. S. Field, H. P. Dodson and T. M. Miller.

W. J. Hill was re-elected representative to the California Cured Fruit Exchange.

The Exchange was represented at the Anderson meeting by its president, secretary and general manager. A very satisfactory report was given of the association and exchange work for the past year.

A TEST OF COMMERCIAL FERTILIZERS FOR GRAPES

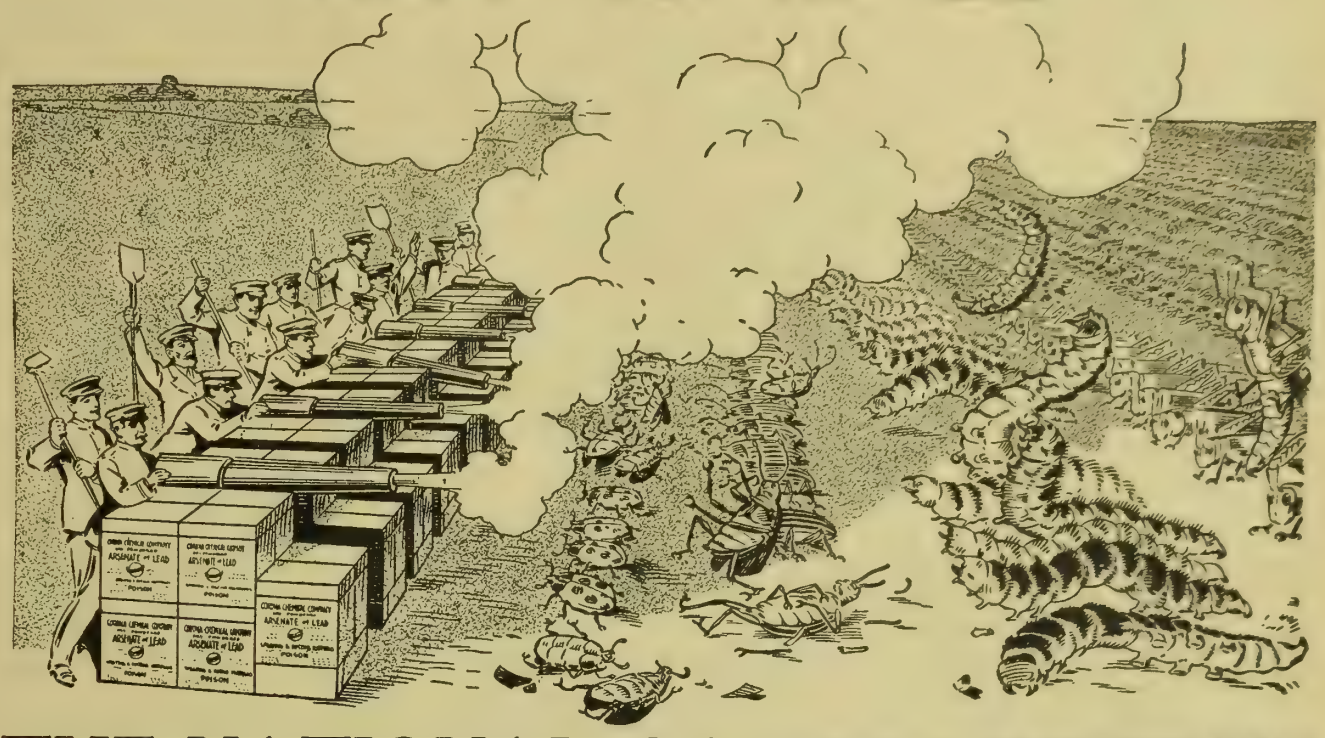
There has been a decline in yields of grapes in the chief grape growing region of New York. This bulletin is a report of several experiments to determine the value of commercial fertilizers in increasing or restoring former yields. The results of the experiments carried on at a vineyard near Fredonia show that nitrogenous fertilizers had a marked beneficial effect upon the yield, upon the quality of the fruit, and upon leaf and wood growth, making it certain that nitrogen is the limiting factor in this vineyard. Lime had no appreciable effect on this vineyard, and phosphorus and potassium had so small a beneficial effect that their use was not profitable. The conclusions reached from the results at this vineyard and those where cooperative work was carried out are that fertilizers cannot be profitably applied except where the vineyard is put in good condition by proper drainage and tillage and the insects or fungi are under control. Where the vineyards receive proper attention and care, fertilizers can be applied with good effect, nitrogen being the element most frequently needed.—New York Agricultural Experiment Station, Bulletin No. 381.

PLANT BREEDING FARM

Mr. J. H. Mack, of Fallbrook, San Diego County, writes regarding his plant breeding farm which has been maintained there for several years. He says that there has been produced on the place a new variety of sweet corn which as soon as thoroughly proven will be offered to the trade. There have also been produced new varieties of blackberries and raspberries and other hybrids from dewberries, blackberries and loganberries.

CORONA DRY WEEK

MAY 15 to 22



THE NATIONAL GARDEN DEFENSE

You can save your growing plants from insect attacks—if you act in time. One bug or worm today means a million **to come.** Dust or spray your fruit trees and vegetables with "CORONA DRY"—**now** is the right time—and kill the leaf eaters before they get a good start. Don't wait until the fruit is infested and the leaves half gone. **Dust or Spray Now!**

"CORONA DRY" is pure Arsenate of Lead, put up in a patented form for home use. It is the ideal method of killing leaf-eating insects on vegetables, flowers, small or large fruits, and ornamental trees and shrubs. You simply blow the dry powder over the plant with an inexpensive duster. It will not burn the foliage. Spreads rapidly and clings tight. So simple that a child can apply it successfully. If a spray material is preferred use Corona Dry. Used by hundreds of the largest growers.

Dust or Spray Everything with

"CORONA DRY"

PATENT ARSENATE OF LEAD

The easiest method of insect control ever discovered. Just pour a little of the "CORONA DRY" into the Duster and blow it over the foliage. Each puff covers a hundred leaves.

Most economical because it spreads so thoroughly and clings on the leaves so long. Will not cake or lose its strength, and you will need no other insecticide if you have "CORONA DRY"—the universal insecticide.

Better for Potato Bugs than Paris Green, because it covers the plant better and less is required to kill each bug. Rain does not wash it off so easily. Can be applied 10 times as rapidly.

Kills Sweet Corn Worms where all other methods fail. One puff of "CORONA DRY" on the new silk of the ear kills the worm before it gets inside. The only satisfactory preventive of this destructive pest.

"CORONA DRY" is safe to use. It requires no water, no mixing, **no expensive apparatus.** Just get a pound of "CORONA DRY" and a Corona Hand Duster. Then you will be prepared for the annual invasion of the insect army.

AS A SPRAY

Corona Dry Arsenate of Lead is an ideal spray material. Perfect results on fruit trees or vegetables are obtained by using one pound to 50 gallons of water.

IMPORTANT—Corona Dry does not clog the nozzle of your spray—one pound of Corona Dry Arsenate of Lead will do the work of three pounds of a paste lead and do it more thoroughly. No waste—no freight to pay on water, and Corona Dry has perfect suspension properties in water. Corona Dry Arsenate of Lead is the universal insecticide either in spray or dust form, and will exterminate the garden or orchard pests.

On Controlling Garden Pests

Our new 16-page booklet—"Garden Pests and Their Control"—tells how to prevent and destroy more than 150 different kinds of destructive insects that infest vegetable gardens, fruit bushes and trees, shade trees, annual and perennial flowers, roses, shrubs, and all kinds of growing things.

This is the most recent and valuable book on this subject, yet we make no charge for it. We will send you a Free Copy upon receipt of your name and address. Write today.

Special Proposition to Dealers!

We offer a very attractive proposition to dealers who sell insecticides. Write us if you are not already handling our line of "CORONA" Dusting and Spray Materials. You will have a big demand for these goods. Write for information.

The Phone for My Home

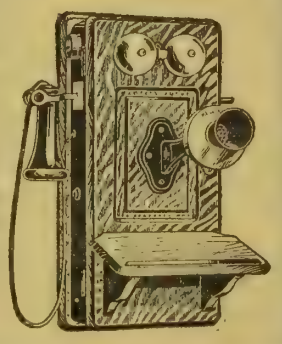
WITH a Kellogg Telephone in your home, you are ahead of trouble and losses that come when sudden illnesses develop or long trips are taken to town only to find the markets gone to pieces.

The man with the good telephone in the house is in quick touch with the voice of the entire world. In a minute he knows the markets. In case of fire, tramps or illness, he can call the whole community. If he has an orchard and the fruit ripens quickly, he can scour the country for help in harvesting. The whole community becomes a living thing to him and that old dread of country life—isolation—is gone forever.

Kellogg Telephones
End Telephone Troubles

They are made in the largest independent telephone factory in the world. and have to undergo the most rigid inspection for quality ever devised. 37 distinct tests given every instrument before it is O. K.'d for shipment.

You may find that Kellogg instruments cost slightly more than ordinary ones. But a huge trade has been built on them all over the world because they do away with repair bills and because after years of service the voice is transmitted as clearly and plainly as when they are new. Just the other day a customer wrote us that he had a Kellogg phone in service fifteen years.



The instrument shown here is Kellogg Favorite. Less wall space, stronger ring, reliable lightning arrester. Standard, unbreakable receiver and mouthpiece, secret service push button to ring "Central" without calling neighbors.

Send in your name and address and we will put you on our telephone bulletin list. Let our expert department help you in your telephone troubles. Get free the kind of information that will save you money. Write for Bulletin 24

The Lawn and Flower Garden

SEEDLING SELECTION

Written for California Cultivator
By Ernest Braunton

IT is a comparatively easy matter for anyone to improve common garden flowers by selection. Of late years citrus growers have been agitated over the matter of bud variation, but they are way, way behind the times. In ornamental horticulture much of plant improvement for hundreds of years has been brought about by taking advantage of bud variation. The remainder of improvement is due to seedling. selection and hybridizing.

Local examples of notable bud variation are too numerous to cite, but in roses alone they are very common. A considerable per cent of the best roses are sports or bud variants. The latest of these is the Red Cherokee or Ramona, discovered and propagated in Los Angeles. No two plants in all the world are alike. A million seeds of poppies sown together produce a million individuals each one of which differs from the others to a slight degree.

One of the million must be the tallest though by ever so little; another the smallest. This one grows the largest flower or the smallest, the darkest in color, the lightest, the flattest, the deepest cup-shaped, etc. One flowers earliest, another latest. One bears ten flowers, another but one. One or a few may show a slight tendency to doubleness, and this the observant gardener quickly notes and seizes upon as the first step in the production of doubles; and in the end he succeeds.

Added to all these natural and unexplainable variations are those due to climate, soil, food supply, moisture supply, shade, sun, etc., scores of causes. Why not take advantage of these known variations and by selection so improve a type as to make it commercially valuable? When a most excellent flower shows in your garden perpetuate it either by seeds, buds, cuttings or grafting. Amateurs furnish 90 per cent of new plants

Tuberous Begonias

The tuberous section of the begonia family contains the ones that should be called the flowering begonias for reasons that are plain to all who have grown them. The flowers are larger and richer in both color and texture than those of the fibrous-rooted section. They may be had in every shade and color except blue and its allies; in single, semi-double, and double; plain, fluted, frilled and fringed. They are as easy of cultivation as any begonias and will endure as much neglect. In my own garden there are bulbs that have been in the same place, without the usual annual removal, for five years, and each year they bloom freely. Only the singles will endure such neglect.

The Best House Plant

The best house plant, all things considered, is no doubt Kentia (Howea) Forsteriana. K. Belmoriana is a fine looking plant yet not quite so hardy and is slower in growth. Anyone who can grow any sort of house plant will succeed with these palms. Careful attention to watering and an occasional gentle sponging of the leaves will keep Kentias in good health. From spring until Christmas each year a dose of light liquid manure should be given once a month. In locations practically frostless these palms (K. Forsteriana) are hardy, needing protection from sun more than from light frosts.

The Boston Fern

No other fern is so universally popular for house use as the one known as the Boston. It is properly Nephrolepis exaltata, variety Bostoniensis, being a broad-leaved, drooping light-green variety of the common sword fern native to Florida and some other parts of the world. During the past few years some splendid sports of the Boston have appeared, the most popular of which seem to be Whitmanni and elegantissima.

Fern Balls

In years gone by Japanese fern balls were very popular everywhere but are now less grown in Southern California than farther north, doubtless for the reason that as one journeys south the air becomes more dry. This change is quite noticeable in summer even in so short a journey as from Los Angeles to San Diego. The fern balls are made of Davallia bullata, a sort with running root stalks, the leaves of which in nature die down every year. The fern balls should be dried off each year to rest the plants and when growing should be kept damp and in a damp atmosphere. Watering should be done by immersing in a tub of water, and once a month this bath should be weak liquid manure.

A Rare House Plant

Pandanus Veitchii is very little known but is not a difficult plant to keep in health in living rooms. In appearance it might be likened to a prickly dracaena with leaves striped with white longitudinal bands. It needs a warm temperature but may be maintained in thrift in any well-lighted room or window if careful attention is given to watering. Lack of soil drainage is as fatal to pandanus as exposure to frosts.

Laggard Chestnuts

The other day I met a ranchman from near Covina who complained of the lateness of a fine young chestnut tree in both leaf and blossom and also that it had bloomed three years but set no nuts. All chestnut trees are late. In eastern states where willows, alders, etc., bloom April 1st, chestnuts often do not bloom until July. Chestnuts are rather an uncertain quantity and many trees are self-sterile, either refusing to set nuts or bearing burrs containing nuts which never mature. The remedy for this latter fault is to plant two or more trees close together or to graft into the top of a tree growing in an isolated position a branch from another chestnut tree. By the way these are grand ornamentals, among the best in deciduous shade trees.

Soil for Ferns

Anyone living in the country may reach canyons and procure a sack of leaf mold, well rotted, not dried leaves. Run this through a fine mesh sieve and you have an ideal soil for ferns, asparagus, begonias and a host of plants of like requirements. If the supply of leaf mold is scanty, use but one-third, the remainder make of equal parts of sand and common garden loam. Such a mixture, with a thorough incorporation of more or less well rotted animal manure is ideal for all classes of plants. It is essential that drainage should be free with all pot plants.

The Soft or Silver Maple

Southern California is not a very favorable section for deciduous trees on account of its arid summer atmosphere. So that any such tree thriving in the south end of the state should grow still better as we progress northward.

For damp sandy soils I have not seen a better tree than Acerdasycarpum, the soft or silver maple. One I recall was planted by me in a collection of more than a dozen species of deciduous trees. The situation was one where fine river bottom sand, very retentive of moisture, was found to a great depth. Of all trees planted the maple grew the fastest and was also the handsomest by a considerable margin. For either street or garden shade in such a soil it cannot be surpassed by any tree common in California.

Farm Bureaus

THE Cultivator is glad to give below additional notices of farm bureau meetings and items as to work being done in different counties of the state through the month of May. Others were given in our issue of May 6.

Madera County, Thos. C. Mayhew, Adviser, Madera

Chowchilla, May 3.
Madera, May 5.
Eastin, May 13.
Raymond, May 18.
Coarse Gold, May 20.
Oakhurst and Nipinnawassee, joint meeting, May 22.
North Fork, May 22.

A joint meeting of the Nipinnawassee and Oakhurst centers will be held in conjunction with the Fire Protective Association and the government forestry service.

The recently completed club house at Chowchilla was built by that center alone, the money being raised by the farm bureau by subscription, by giving entertainments, etc.

Ventura County, Wm. B. Parker, Adviser, Ventura

Fillmore, May 3.
Ventura Avenue, May 7.
Nordhoff, May 10.
Oxnard, May 12.
Camarillo, May 14.
Saticoy, May 19.
Moorpark, May 20.
Somis, May 24.
Santa Paula, May 25.
Simi, May 26.
Mound, May 25.

San Joaquin County, Frank F. Lyons, Stockton

Directors' meeting, Stockton, Saturday, May 1.
Thornton, Monday, May 3.
Lodi, Thursday, May 6.
Acampo, Friday, May 7.
Lockeford, Monday, May 10.
Linden, Thursday, May 20.
Bellota, Friday, May 21.
Stockton, Saturday, May 22.
Escalon and Farmington, Monday, May 24.
Agronomists' convention, Tuesday, May 25.
Ripon and Manteca, Wednesday, May 26.
Tracy and Union Island, Thursday, May 27.
Holt, Friday, May 28.
Thornton, Monday, May 31.

Mr. S. V. Wolfe who has been hired as tester of the San Joaquin County Cow Testing Association started testing this week. All the expenses of the association are included in his salary.

Seven hundred cows have been entered in the association and more are expected. The cost of testing will be $1 per cow per year.

Dr. Cady will be in San Joaquin County during the latter part of May and the first of June.

Many of our fertilizer demonstrations are beginning to show results, particularly those where ammonium sulphate is used as a cure for little leaf.

There are three boys' agricultural clubs in the county, one at Lodi with 18 members growing one-eighth acre plots of potatoes; one at Stockton with a membership of 13 growing one-fourth acre plots of potatoes, and one at Ripon with a membership of 13 growing one-half acre plots of popcorn. Five of the boys in the Stockton club having no available land have secured two acres in a subdivision near town and are growing their potatoes cooperatively. They clubbed together to buy their seed and fertilizer and are hiring their team work done at the same time. Two of the boys have rented more than a quarter acre and are growing potatoes and melons as a business venture.

San Diego County, H. A. Weinland, Adviser, San Diego

Encinitas, Monday, May 3.
Fallbrook, Wednesday, May 5.
Bonsall, Friday, May 7.
Escondido, Monday, May 10.
Ramona, Wednesday, May 12.
Dehesa, Friday, May 13.
(Special meetings with Dr. Webber):
Chula Vista, Monday, May 17, 7:30 p. m.
La Mesa Heights, Tuesday, May 18, 7:30 p. m.
Spring Valley, Wednesday, May 19, 2:30 p. m.
Lemon Grove, Wednesday, May 19, 7:30 p. m.
Escondido, Thursday, May 20, 2 p. m.
El Cajon, Friday, May 21, 7:30 p. m.
Nestor, Monday, May 24.
Mission Valley, Wednesday, May 26.
Jamacha, Friday, May 28.

Glenn County, W. H. Heileman, Adviser, Willows

Ord Farm Center, May 3 and 4.
Bayliss Farm Center, May 6 and 7.
Codora Farm Center, May 10 and 11.
Larkin Farm Center, May 13 and 14.
Orland Farm Center, May 17 and 18.
Hamilton District, May 19.
Jacinto Farm Center, May 20 and 21.
Newville District, May 24 and 25.
Elk Creek District, May 27 and 28.
Orland Farm Center Picnic, May 29. Special dairy program at picnic.

The county is maintaining two boys' high school agricultural clubs and doing cooperative work with the Princeton Club over the line in Colusa County.

The bureau directors' meeting held the first of the month started field work on a county drainage campaign in which each center in the county is cooperating. The campaign has to do largely with plans for controlling winter run-off and storm water.

The farm bureau is engaged also through its directors and local committees in each center in collecting data for the development of telephone and electric power and light service in the county. This important matter is being carefully canvassed over the entire county.

Each of the farm centers in the county and the board of directors have favorably passed on the McPherson marketing commission bill in the state legislature and proper parties interested in these matters have been notified of the action taken by the county organization.

The Glenn County farm bureau during the coming month will give its attention largely to the formation of dairy and hog raising associations in the county. It is planned to form a Farm Bureau Dairy Association throughout the various farm centers. The hog raising association will aim to protect and build up the hog industry of the county. The live stock interests of the county are entering into the bureau work with a great deal of enthusiasm.

A squirrel and gopher campaign is formulating throughout the county, and attention is being given in the various centers to cooperative buying of special farm implements such as manure spreaders, feed cutters, grinders, and other tools used more or less periodically throughout the year.

The farm centers over the county have passed favorably on the subject of a monthly publication and a farmers' exchange. The first issue of the farm bureau monthly will appear perhaps during the coming month.

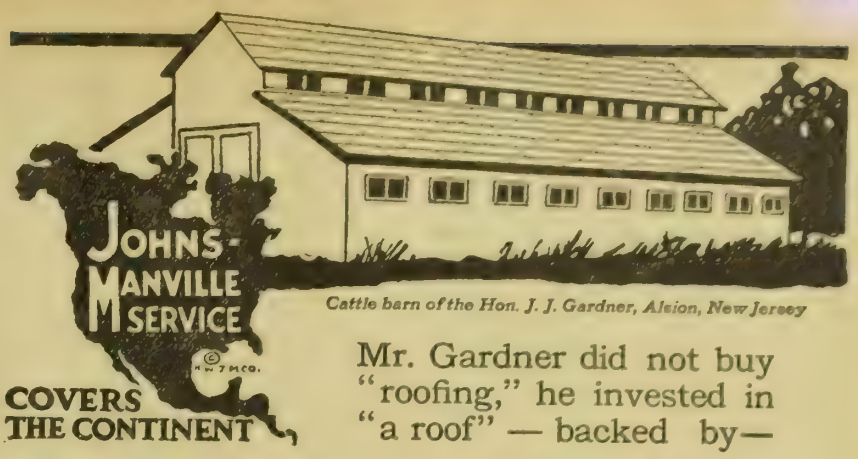
The farm bureau in the county has been organized less than two months and in this short period has taken an active part in the assembling of plans for needed development. Attention to a great deal of individual and miscellaneous work relating to soils, crops, and live stock has been given by the organization and the county adviser, and added to this routine several large county wide undertakings are going ahead.

It is estimated that the shipment of citrus, other trees and vines into the county this spring will reach one million. So far it is a season of good crops and substantial development.

Humboldt County, A. H. Christiansen, Adviser, Eureka

In reply to question as to the cooperative marketing and purchasing of farm produce and farm supplies by the Humboldt County farm bureau, Adviser A. H. Christiansen writes: "The farm bureau proposes to standardize all of the products raised by members of the bureau and find a market for them, also to purchase stuff needed on the farm like seeds,

(Continued on Page 568)



Cattle barn of the Hon. J. J. Gardner, Alsion, New Jersey

Mr. Gardner did not buy "roofing," he invested in "a roof" — backed by—

J-M ROOFING RESPONSIBILITY

A building that is roofed with J-M material *must* be roofed satisfactorily—"good will" is the basis of our half century reputation. When you register your roof with us, you make it possible for the largest roofing organization in the world to bring you within the scope of an inspection service that makes your guarantee worth while.

J-M REGAL READY ROOFING

The "rubber type" roofing of highest quality sold at a price lower than that usually asked for ordinary roofings of this type. Our great manufacturing and distributing facilities and the large quantities in which Regal is turned out make this possible.

Made of high-grade Wool Felts thoroughly saturated with Trinidad Lake and other Natural Asphalts.

Years of perfect service in every square of it and J-M Responsibility squarely behind it.

Easiest to apply because of J-M Vise Grip Cleats, which do away with cement yet make joints water-proof.

J-M Asbestos Roofings are examined and approved by Underwriters' Laboratories under the direction of The National Board of Fire Underwriters.

J-M ASBESTOS READY ROOFING

The famous "White Top." Most attractive in appearance of all ready roofings and the most economical in the end. First cost only cost, because it needs no painting. Spark-proof, fire-retardant and weather-proof.

J-M TRANSITE ASBESTOS SHINGLES

Gaining in popularity everywhere not only because of their fire-resistant qualities but also because of their fine appearance and the absolute certainty of their permanent durability. Put on J-M Shingles and forget your roof

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

Redlands & Yucaipa Land Co.

About That Osborne Mower

THERE are a few features you ought to know all about. One of them is the eccentric bushing that keeps the cutter bar lined up with the pitman.

You know how the cutter bar will get to sagging, no matter how careful you are. It bumps into clods, ant-hills, stones and stumps that you don't see until too late, and first thing you know it's hard to pull and you begin to break knife heads and have trouble.

An Osborne cutter bar can be kept in line all the time—without fail—by the simplest, surest, easiest arrangement you ever saw. It won't take five minutes for you to see it and that may be a very profitable five minutes for you. Drop in on your way by.

BEAN CULTURE IN CALIFORNIA

(Continued from Page 555)

ing immediately afterwards. For average conditions medium planting will give the best results. From the first to the fifteenth of May, depending upon the locality and soil, is generally considered the most desirable planting season.

Rate of Planting

The general practice is to plant beans in rows although on very weedy land they may be planted in hills in order to permit of cross cultivation. The distance between rows and the spacing of the beans in the row may vary within wide limits depending upon the vigor of growth which in turn is influenced by the variety used and soil conditions. A very desirable spacing for average conditions is in rows 28 inches apart with the beans dropped from two to four inches apart in the row. For average size beans, such as the Lady Washington, this spacing would require from 25 to 30 pounds of seed for an acre. Using larger beans, such as the Bayo, 30 to 40 pounds would be required at this spacing. This is not heavy seeding and may be increased by 30 per cent where cutworms or other pests are known to be destructive. The Blackeye, Lima, Bayo and Cranberry are large vigorous growing varieties and the spacing should be increased in order to provide ample room for complete development.

Method of Planting

For small areas a trench may be opened and the seed dropped by hand. This method is quite as satisfactory as machine planting but it is necessary to drop and cover the seed immediately after opening the trench in order to prevent the soil from becoming dry.

An ordinary grain drill may be used for planting beans, providing the cups are large enough to accommodate the seed. An 11 row grain drill with seven inches between drill tubes may be fitted for bean planting by plugging all of the cups excepting the second, sixth and tenth. With such a drill the rows will be spaced 28 inches apart. The beans may be dropped at any desired interval in the row by adjusting the regulator.

For seeding large fields the most popular planter is the common two-row machine which in general appearance and construction is very similar to the corn planter. It is equipped with two hoppers and may be adjusted to plant beans at any desired spacing. There are several makes of this type machine on the California market, and in purchasing such a planter it is a matter of first importance to first test the machine with the variety or varieties which it is proposed to plant, to see if the planting plates are adapted to those particular varieties. The two-row riding planter of this type retails for about $40, and the one-row walking planter of the same type for about $15.

Depth of Planting

The proper planting depth under any conditions is determined largely by the soil moisture distribution. It is of vital importance that the seed be planted deep enough to be in contact with moist soil. If the soil is dry to a depth of several inches it should be ring rolled before planting for the purpose of bringing the moisture near the surface.

Because of this method of sprouting, which is to push its two large seed leaves up through the soil, the bean will not stand as deep planting as corn and many other large seeded crops. For average soils one and a half inches is considered a good planting depth, but on the lighter soils, especially when the moisture is some distance below the surface, the depth may be increased to about three inches. On the extremely loose peat soils of the delta region a planting depth of from four to six inches has given better results than shallower planting.

Cultivation

Most of the cultivation for beans, as previously described, should be done before planting time. If the ground has been thoroughly worked before planting there will be less necessity for inter row cultivation after the plants are up. In general cultivation should commence as soon as the seedlings are large enough so that the rows may be seen across the field and should be repeated at intervals of from one to two weeks up to the time the vines come into blossom, or until such time as the vines interfere with the passage of the teams and implements. Cultivation should be discontinued at blossoming time because the flowers are very delicate and easily destroyed by contact with the horses or cultivator. The most efficient implement yet devised for cultivating beans between the rows is the V-shaped sweep cultivator of the two row type. The bean is a surface feeder with many shallow roots, and a shallow draft cultivator such as the sweep is required. The ordinary corn cultivator of the shovel type is used by many bean growers but becuse of its deep penetration it cuts off and deprives the plants of many of their feeding roots and is less efficient in destroying weeds.

On very weedy land, especially when the preparation has not been thorough, special precautions must be taken to control the weeds. Two or three days after planting, and before the seedlings have appeared above the ground, the land may be gone over with a light spike tooth harrow, thus destroying many small weeds. If many weed seeds germinate at the same time as the beans and threaten to become serious, it is desirable to repeat the harrowings even after the beans are up. Many growers hesitate to harrow a field of young beans, but if the land is level and free from clods and the implement is run crosswise of the rows this working will result in but slight injury to the crop.

THE LURE OF THE LAND

"The Lure of the Land, Farming After Fifty," by Harvey W. Wiley, published by the Century Company, New York, $1.40 net, postage ten cents.

"A book for the thousands of men and women in the large cities who have felt the lure of the land and who are inclined to believe that a farm offers the happy and safe solution of their special problem. Sane, practical, constructively helpful discussion of the general question of the lure of the land, the "born on the farm" myth, the dairy the hope of the small farmer, farm labor, the farmer's market, the farmer and the parcel post, the decreasing meat supply, etc., etc. Here are facts which every city man who wants to try farming should know—much wholesome advice also for most farmers, concerning opportunities to be improved. Dr. Wiley writes out of the wisdom of a lifetime of experience with farm life in all its phases, enriched by careful study of the problems of country life. A book very human in its quality and invaluable for its reliable information."

We were not aware that Dr. Wiley had posed as a farmer, but he is most successful in the 30 chapters in this book in stating facts which must prove enticing to the city man who has not had actual farm experience. Apparently Dr. Wiley was born on a farm for the book is dedicated:

"To the memory of my father and mother, pioneers of the backwoods of Southern Indiana, who taught me the homely duties of cultivating the fields they rescued from the forest, reverence for truth and to battle for the right, and illustrated by their example the dignity of labor in a hard environment."

The last paragraph in Chapter II, Agriculture a Learned Profession, is as follows:

"I doubt if there is any other branch of knowledge today which has a larger endowment, more competent corps of teachers, more enthusiastic pupils, than the great university of agriculture, which exists in all of the manifold forms which I have described throughout the length and breadth of the land. The United States is by no means the only country in which it is recognized that farming is a learned profession. In Europe and in the islands and continents of the seas, and even in Asia and Africa, the elucidation of the fundamental principles of agriculture is constantly carried on. Professors and tutors and artists and mechanics and photographers and illustrators are carrying this new propaganda throughout the world."

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Adopted Son

What power has a foster-father over his foster-son after he is 16 years of age? Has a foster-son any right to ask for a part in the property of a foster-father after he dies if the father has legally adopted him, providing the father does not make a will in favor of his wife?—Subscriber.

After adoption the adopted child and the person adopting sustain towards each other the same relations as parent and child and have all the rights and are subject to all the duties of that relation. The foster-father is thus entitled to the custody, services and earnings of the child until the said child obtains its majority or has a guardian appointed by a court with competent jurisdiction.

Horse Sold by Non-Owner

A let B have the produce he could grow on his farm during the growing season without any consideration. Verbal agreement was that A furnish team of horses, wagon and tools. In a month or so B exchanged one of the horses for another and his wife paid $25 difference. Mrs. B now claims that the animal is her personal property. Is there any law by which this animal can be recovered, as the former animal cannot be found? If animal cannot be taken please state in what way A can recover the value of his animal—Subscriber.

A would be entitled to bring action to replevin the horse which the woman has upon affirming the transaction as a sale. Where one willfully uses the materials of another without his consent, the product belongs to the owner of the material if its identity can be traced.

Trees Not True to Name

Four years ago I bought fruit trees of a nursery company which proved untrue to name. This was proven by the first fruit they bore last season. I have grafted them over, but consider it a great loss to me. To what recompense am I entitled and how shall I proceed to collect?—Subscriber, Beaumont.

You have a right of action against the nursery company for breach of the implied warranty upon the part of the nursery company as to the trees sold. Your measure of damages would be the value the property would have had at the time to which the warranty referred, if it had been complied with, or its actual value at that time; this would undoubtedly be the difference between the value of the trees when they arrived at fruit bearing stage, if they had been such as you presumed you were purchasing, over the trees which you actually did purchase. You are also entitled to fair compensation for the loss incurred by an effort in good faith to use said trees, thus if your trees were now found to be worthless it would be the value of your work and of your lands during the period of raising them to the point where they would bear fruit; however you mentioned that you purchased these trees four years ago and it might possibly be that the statute of limitations would run against you, so you should take prompt action. (In addition to Mr. Stanton's opinion given above we call attention to the fact that practically all nurserymen's guaranties contain the following clause: "We give no warranty, express or implied, as to description, quality, productiveness or any other matter of seeds, bulbs, plants or trees we send out, and will be in no way responsible for the crop. If the purchaser does not accept the goods on these terms, they are at once to be returned."—Edit.)

Interlocutory Decree

After an interlocutory decree is granted does the neglect to enter final judgment at any time invalidate the divorce? Are the parties still married in the eyes of the law? Can the defendant inherit any of the wife's property while the case stands as above, provided she dies without making a will in the meantime?—Subscriber.

Neglect to enter final judgment in divorce does not invalidate the divorce as the final divorce may be entered at any time after one year has expired, but until such final judgment is entered, parties sustain to one another the legal relation of husband and wife and would be entitled to inherit one from another just as though they were not divorced.

Trespassing Stock

For over two years have been bothered by 20 to 60 head of neighbor's mules. What is one allowed per head for stock corraled that have done no damage? Can one also collect damage for crops destroyed, and what is one allowed per head for feeding stock corraled and owner notified?

The procedure for handling estrays has been several times heretofore detailed in these columns. The sum allowed a taker-up for the keeping and care of each horse, mule, jenny, ass, bull, cow, ox, steer or calf is 30 cents per day. The sum of 10 cents per day is allowed for the keeping and care of each sheep, goat, hog or other animal not herein above specified. You are also entitled to collect damages in a separate action brought against the owner of the animals for any and all loss occasioned to your crops.

Damage by Stock

Have a lease on ten acres of land sowed to alfalfa. A neighbor pickets his cows and horses on it and lets them run loose on it. Have told him to keep them off, but he doesn't do it. What is the best way to pursue to make him keep them off or pay damages?—Subscriber, Hemet.

It would seem that the best way for you to do would be to take the cows and horses into custody as estrays and if this was done whenever they were placed upon your property and the owner was obliged to pay the costs as provided for under the estray act, you would probably have little trouble.

NOT IN THAT CLASS

Judge: "You admit, then, that you stole the loaf of bread?" Woman prisoner: "Yes, your Honor." Judge: "What have you to say for yourself?" Woman: "Nothing, your Honor. If it was lace or jewelry I might plead kleptomania, but we can't work that when it's bread."—Boston Transcript.

THE LIMIT

"She is simply mad on the subject of germs and sterilizes or filters everything in the house."

"How does she get along with her family?"

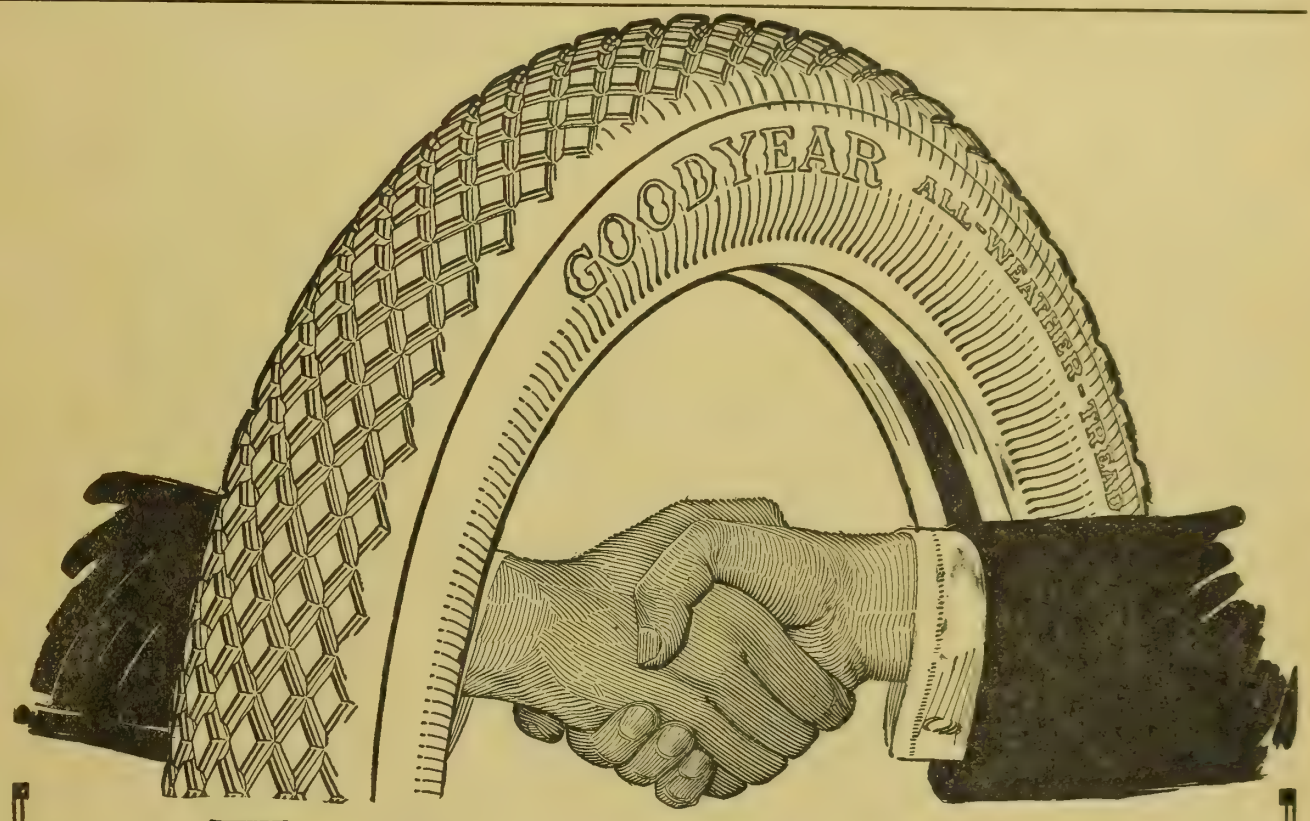
"Oh, even her relations are strained."—Philadelphia Public Ledger.

TEMPUS FUGIT

"Why, what in the world has become of your watch? The one you used to have had a handsome gold case."

"I know it did, but circumstances alter cases."—Philadelphia Telegraph.

The way to move out of a small job into a bigger one is to grow out of it. Likewise, one must grow out of the small town.



The Co-operative Tire

Goodyear attained the top place in the tire field by building co-operative tires.

We have given you every saving you have helped us make—and more beside.

The more you bought the better we built them, and the lower we sold them to you.

Three Reductions

Note that in two years we made three big price reductions. The last—on February 1st—brought the total **to 45 per cent.**

Yet in those two years we made expensive improvements—two of them very expensive. And not in one iota has the tire been skimped.

Hidden Extras

Note that every hidden extra is retained. Our Fortified Tire is still "On-Air" cured to save blowouts. Yet that one extra—used by no one else—costs us $450,000 yearly.

It still has our exclusive No-Rim-Cut feature. It has in each base 126 braided piano wires to make the tire secure. It has hundreds of rubber rivets, formed before vulcanization, to combat loose treads.

Our All-Weather tread is still double-thick; thicker than ever in some sizes. It still has those sharp, tough, resistless grips.

Those extras—all exclusive to Goodyear—are all retained, despite our price reductions.

Still That $100,000

And we still spend on experts—on laboratory work—$100,000 yearly. That is to test tires built in different ways, to learn how to build them better. And every improvement we discover is adopted regardless of cost.

Years ago these extras compelled a price one-fifth more than others. Yet men flocked to these tires by the hundreds of thousands. Goodyear became—as it is today—the world's largest-selling tire.

As this multiplied output brought our cost down, your cost came down too. Last year we built about one tire for every car in use. This year you get in Goodyears a value never before known in tires.

GOODYEAR
AKRON, OHIO
Fortified Tires

Fortified Against:
- **Rim-Cuts**—by our No-Rim-Cut feature.
- **Blowouts**—by our "On-Air" cure.
- **Loose Treads**—by many rubber rivets.
- **Insecurity**—by 126 braided piano wires.
- **Punctures and Skidding**—by our double-thick All-Weather tread.

Join in this co-operation. Ally yourself with the largest maker, and the one who serves you best. Thus you will help to make Goodyear tires better and cheaper still. Any dealer will supply you.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

Makers of Goodyear "Tire Saver" Accessories; also Goodyear "Wing" Carriage Tires and other Types

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

DEDICATED

The California building at the P. P. I. E. was dedicated last Tuesday. It is Californian in architecture, in exhibits, and more than all, in its hospitality. Its hospitality began long before its dedication, but like all other buildings at the exposition the formal dedication served to attract attention to its wonderful exhibits and to its beautiful architecture. Every attendant at the exposition should make it one of the first points visited.

LIGHT PACK

Canners are announcing that owing to high price of sugar and an indifferent market it is probable the canneries of California will run light during the coming season. It has been the policy of the canners to pack considerably beyond the actual business in sight, trusting to markets to clear off the reserve. Whether this is a bona fide statement of conditions or whether it is for the purpose of bearing the market before purchasing fruit for the season we are unable to say, but there is one lesson in the present situation, and that is cooperation. The fresh fruit cannot be kept by the producer, and if the canners refuse to purchase the dry yard is the only way to save the fruit, and this is not always satisfactory. The cooperator, however, can by a slight investment in sugar put his fruit into condition in which it will keep for months, then a market may be developed which will handle it at a living price.

We recently gave an account of one of the most successful canneries, located at Porterville. It is to run the coming season and we believe will save money for its members. There should be more like it in California, and there will be if the canners will only give us a little more encouragement in the unjust treatment of producers.

IN CALIFORNIA

Secretary of Agriculture Huston has been visiting the various forest reserves in California during the last week. His idea was to find out for himself to what extent their timber, forage, water power, recreational and agricultural resources are being developed for the public under present methods and to make a study of the administrative problems of the forest service. Under the methods employed in handling the livestock grazing business of the national forests agricultural development is benefited not only through the prevention of injury to watersheds but also through the opportunities opened for ranch development. As new settlers locate near the forests room is made for their stock by cutting down, if necessary, the number of stock allowed the larger permittees. More than 16,000,000 cattle, sheep and hogs, including young stock, will find forage this year on the national forests. The revenue from this source is expected to exceed $1,200,000 in 1915.

ADVERTISE

We note in the accounts of the disturbance which prevails in the fruit growers' cooperative marketing associations of the Northwest that one of the economies to be practiced is in cutting off appropriations for advertising purposes. In this connection we quote from an Eastern farm paper which calls attention to the advertising campaign carried on by the California Fruit Growers' Exchange, which has greatly extended its market and brought better prices to the members of its organization:

"Some of the first ads published explained at some length the purpose of the organization. Other ads said nothing about cooperation, but were devoted wholly to the fruit. The advertising man soon found, to his surprise, that announcements explaining the work of the exchange brought the best results. The American public demonstrated that it had an interest in cooperative effort, and people not only bought the fruit but wrote to commend the cooperative idea."

We believe that is a most excellent suggestion. Personality, even in advertising, adds strength. The apple growers of the Northwest might well appeal to the consuming public by throwing a little of their personality into their apple campaign and informing the world of their efforts along the line similar to that followed by the orange growers of the Southwest.

Above all, advertise and let the world know the worth of the fruit of the Pacific coast.

FROM AUSTRALASIA

Under the head of "A California Embargo" we note the following in the "Fruit World of Australasia":

"It is unfortunate that the California state department of agriculture should have made such unwise regulations as to prevent fruit from New South Wales, Queensland and Western Australia entering the port of San Francisco for participation and competition with the nations of the world at the Panama Exposition. The reason for this is stated to be the presence of the Mediterranean fruit fly, which pest is active in certain portions of the states named. The California department quoted from government reports issued by Mr. Froggatt, and plainly declared to Mr. Nielsen, New South Wales Trade Commissioner, San Francisco, that their decision was final. Mr. Nielsen offered to produce government certificates that the fruit was unaffected and pointed out that large areas in the states named were entirely and absolutely free from the fruit fly.

"It is to be hoped that wiser counsels will soon prevail and that these unnecessary restrictions to trade will be speedily removed."

It is a deprivation to Californians not to see the results of the work of Australian orchardists. Their exhibits would doubtless have been an education and Californians would have been glad to give the Australasians opportunity to prove to the world the fruit-producing capacities of their continent. But California has been fearfully punished because of the laxity which prevailed in early days when many pests were introduced which have costs millions. If we remain in the fruit-growing industry we must maintain a most rigid quarantine wherever there is a possibility of danger, and we believe that in the main the position taken by our state horticultural commission will be supported by the fruit growers.

ADJOURNED

The California state legislature adjourned last Monday. Hundreds of bills were rushed through at the last moment and doubtless without very full consideration. Hundreds were left without reaching a vote. This is easily excused, however, when it is understood that there were 3000 bills presented, many of which were of little value. This is somewhat of an improvement over the previous session, for at that over 4000 were introduced. It has been shown during this session that many of these bills were presented by the lawmaker without any understanding of their true intent, merely on request of some constituent. There should be restriction in this matter, there should be fewer bills, and the people should be given more opportunity to look over those few. It has been intended to aid the public to secure an idea of the various bills by the so-called bifurcated session, that is, there has been a period of introduction, then a recess for discussion and investigation, then a reconvening to finish the business of the session. The principal complaint against this practice was that while the public informed itself upon the bills or upon a particular bill, when the legislature reconvened the bill was sometimes so completely changed by amendments that it was finally passed in a form which practically reversed the original intent of the bill. Therefore this bifurcated session was discontinued by the legislature just adjourned.

One of the bills which finally passed and on which there was a hard fight was the McPherson bill providing for a state marketing commission to which farmers can send their produce for sale. The bill calls for an appropriation of $25,000 to inaugurate the service. It makes the salary of the market commissioner $5000. This is in the nature of an experiment and is intended to pioneer the way in marketing farm products.

The Ashley standardization bill also passed, though it was bitterly fought on the ground that it was an effort to protect the farmer against himself. We hope it will prevent shipping of inferior and green fruit from the state.

Many are disappointed that the bill providing centralization of all agricultural work under one secretary of agriculture was not successful. There has been a world of discussion along this line and it perhaps may crystallize in a more satisfactory bill which may pass at another session.

Notwithstanding a remark made by a large newspaper, which is opposed to the policies of the majority of the legislators, that the most worthy act of the present legislature was the motion for adjournment, we believe its work was generally commendable.

Agricultural Notes

In England and Wales there are 157 cow insurance societies.

The College of Hawaii has added a four-year course in sugar technology.

American cotton mills are now using 5,000,000 bales of cotton annually.

The Ise of Pines' grapefruit for the next season will, it is now estimated, amount to 200,000 crates.

Experiments made on the value of sugar cane trash for paper manufacture indicate a fair profit.

The island of Sardinia has 152 cooperative agricultural societies working together in a federation.

The campaign against bovine tuberculosis in the Hawaiian Islands is reported as making substantial progress.

New Zealand veal is being shipped to San Francisco, the Moana having just brought 200 cases from Wellington.

A "deferred" cable rate is instituted between Honolulu and San Francisco. This rate is eight cents per word.

Chinese cottonseed oil was imported through San Francisco last year to the extent of 6,293,140 pounds, valued at $363,232.

Large shipments of Mexican tomatoes have been received in Los Angeles by steamer, the rail shipments being stopped by the revolution.

The Spanish minister of public works is encouraging the planting of American wheat which he regards as best adapted to climatic and soil conditions in Spain.

A new 17-day passenger and freight service has been inaugurated between San Francisco and New York, by way of the Panama Canal. Sailings from both ports will be made every three weeks.

The Jewish orange growers of Jaffa in Palestine are unable to market their crop in Europe because of war conditions and have sent a representative to New York to dispose of the fruit in that market.

Uruguay held its second annual stock congress at Durazno, March 4-9 and discussed rural credits, development of the dairying industry and marketing of its products, roads, organization of rural development societies, fairs, etc.

Boys' and girls' pig growing contests are being organized in Illinois. The state board of agriculture and the State Live Stock Breeders Association and a number of swine breeders' associations have given money for prizes which amounts altogether to almost $1,000.

German farmers have been given permission by the government to plant such acreage as they wish to sugar beets this spring. They are required to deliver three-fourths of their crop to the sugar factories; the remainder may be used for stock feed or sold to distilleries for manufacture of alcohol.

As an evidence of the serious effect the slump in ostrich feathers is having on farmers in South Africa may be mentioned the fact that last week one farmer brought in to Graaf-Reinet the pluckings of 40 birds for which he says he used easily to get 300 pounds ($1,460). This time he only got six pounds ($29.20), or one-fiftieth of the usual price. Another case came under our notice where a farmer only got nine pounds ($43.80) for the feathers of 60 birds, whereas between 300 pounds and 400 pounds was the price he was accustomed to receive.

Agricultural News Notes of the Pacific Coast

Northern California

Wool growers of Solano County report an excellent season.

Santa Rosa observed her annual rose carnival last Monday.

Severe winds did considerable damage to fruits in Butte County last week.

Live Oak, Sutter County, has shipped in excess of 2,000,000 pounds of beans.

The University of California commencement day exercises were held last Wednesday.

Six hundred students of the university of California are looking for summer jobs on farms.

Dairymen of the northern end of the state made vigorous protest against the veal bill.

Stock has been subscribed for a cooperative creamery to be constructed at Loyalton, Sierra County.

Arbuckle, Colusa County, is still seeding some lands which were under flood water earlier in the season.

The president has signed a proclamation eliminating 77,000 acres of land from the Sierra National Forest.

County Horticultural Commissioner Bowman of Placer County reports considerable infestation of brown apricot scale.

One of the most complete, well fitted creameries in California is that just completed at Orland in Glenn County.

Strawberries were injured by severe hail storms which visited Bowman, Placer County, about the first of the month.

Dixon, Solano County, observed May day with sports and exhibits of products. The celebration is to be an annual affair.

Farmers at Madison, Yolo County, recently held a picnic at which an exhibit of farm products and babies was the principal feature.

The university of California estimates that over 50,000 hogs have been saved during the past year by the use of hog cholera serum.

Sebastopol berry growers are now shipping strawberries to eastern markets. This is the longest haul ever attempted in strawberry shipping.

At the annual meeting of the Shasta County Cured Fruit Association at Anderson last Saturday Manager Ellis of the state exchange made an address.

Egg men of the state are pleased at the enactment of the Chinese egg bill. It stipulates that the word "imported" must be stamped on all eggs brought from foreign countries.

California now has nine cow testing associations, the largest of which is that of Ferndale, Humboldt County. In that association are 4,000 cows, which makes it the largest association of its kind in the world.

The Natomas Consolidated finished the seeding of 70,000 acres of wheat and barley near Pleasant Grove, Sutter County, only a few days ago. Searchlights were used on the big tractors and work was continuous for months.

Central California

The picking of Valencia oranges began in Porterville May 10.

A large dairy ranch is being established at Poplar, Tulare County.

Tipton and Poplar, Tulare County, will plant large acreages of beans.

Fresno County's tobacco crop netted the growers this year nearly $50,000.

Dinuba orange growers are forming an organization to fight gray scale.

There will be 4,000 acres of rice planted in Kern County this season.

The recent rains are thought to have done more good than injury to all crops.

Tepary beans will be tested in many parts of the San Joaquin Valley this season.

Ceres, Stanislaus County, is making an effort to establish a $50,000 milk condensary.

The state legislature has passed a bill which is intended to prevent shipping of frosted fruit.

Porterville, Tulare County, is shipping out from three to eight cars of canned fruit weekly.

A shipment of 600 head of steers recently went to the San Francisco market from Porterville.

Farm Adviser Mayhew of Madera County reports increased interest in modern methods of farming.

Watsonville has shipped to date more than 200 cars of apples in excess of last year's shipments.

A sale of Jersey cattle held at Modesto last week brought prices rather under those anticipated.

The county board of forestry of Merced County has been planting Black Mission figs along its highways.

A cooperative marketing organization to handle cured fruits has been formed at Del Rey, Fresno County.

Porterville poultry fanciers are planning for the biggest ever poultry event in that county next December.

The Association of Fruit Growers at Terra Bella, Tulare County, will plant extensively of tomatoes for the cooperative cannery.

Tulare County creameries paid out $72,059 for deliveries of March butter fat. This is an increase of $2000 over the preceding month.

The raisin growers' company now has almost entire control of the raisin situation and is in the strongest and best of favor with growers.

Many dairymen of the San Joaquin Valley recently visited Sacramento and urged reconsideration of the dairy bill, which was granted.

Kern County claims that over $4,000,000 was paid for beef produced in that county during 1914. Its product of corn was also in excess of $100,000.

The sealer of weights and measures of Tulare County is urging the marking of tare weight on boxes of fruit and vegetables offered in the markets of that county.

The first full carload of strawberries out of the Pajaro Valley was shipped on April 15. There has now been established a regular "berry special" to San Francisco.

Southern California

Brawley, Imperial County, is shipping about three cars of onions daily.

Orange County has an association of chambers of commerce representing 11 different cities.

Los Angeles observed May Day and all the first week of May in its great Fiesta celebration.

The Imperial Valley is already shipping its new barley crop. Prices are ranging from $1.10 to $1.11½.

The hold-over lima bean crop is moving very slowly. There are over 300,000 bags yet in Ventura County.

Orange County string bean growers are netting most satisfactory sums. Shipments at present are very heavy.

Women's clubs of Riverside County are working to secure more general roadside beautification and improvement.

The greatest walnut producing section of California is Orange County. It has about 14 per cent of the state's total.

The Orange County citrus growers have fully endorsed the methods employed by the California Fruit Growers' Exchange.

Venture County offers prizes in the form of free trips to the world's fair to contestants from the county agricultural clubs.

An association of walnut growers has been formed at Moorpark, Ventura County. There will be about 700 acres in the association.

The board of supervisors of San Luis Obispo County indicate that they will soon make an appointment of a county horticultural commissioner.

Brawley is maintaining a farmers' public market. Produce, live stock, furniture, everything which the farmer may have to sell is admitted.

Orange County citrus growers recently met at Orange and discussed possible methods of securing greater returns for their next year's output.

Orange County sugar factories will manufacture more sugar this season than any preceding year. Contracts are still being made with the farmers.

There was never a time in Southern California citrus sections when there was so great an interest in factories for the purpose of saving waste products of the citrus industry.

Avocado growers of the southern end of the state will meet at the Alexandria Hotel, Los Angeles, on Friday morning of this week for the purpose of organizing a state association.

Farmers in the Palo Verde Valley are discussing the matter of levee construction along the Colorado River. There is some damage visited upon the valley during almost every June flood.

The Olive Heights Citrus Association, Orange County, has commenced suit against a member to enforce delivery of Valencia oranges, which have been sold from under the association.

At the recent annual meeting of La Puente Valley Walnut Growers' Association the following officers were elected: S. L. Watts, president; B. F. Maxson, vice-president; Robt. H. Neely, secretary; C. J. Hurst, Sam Robinson and E. J. Va[illegible] Wig, directors.

The Coast

Texas is shipping an immense quantity of onions.

Burbank potatoes are selling at Yakima, Washington, at $40 per ton.

Crickets are doing vast injury to wheat fields near Spokane, Washington.

Several towns in Arizona have organized farm improvement associations.

A lettuce grower at Yuma, Arizona, has been exhibiting a three-pound head of lettuce.

Lewiston, Idaho, reports its grain warehouses practically empty of last season's crop.

Manager Kelly of the Yuma irrigation project reports that at the present time there are 698 irrigated farms on that project.

The International Soil Products' Exposition will be held in Denver, September 27-October 9.

The Montana stock growers association closed its annual convention at Miles City last week.

The Portland Union Stock Yards report only a medium supply of hogs and prices advancing.

It is reported that there are 65 herds of reindeer in Alaska made up of a total of over 60,000 head.

The regular monthly meeting of the Arizona State Poulty Association was held at Phoenix last Saturday.

Cattlemen of Cochise County, Arizona, report this the best year for cattlemen ever experienced in that state.

The board of trustees of the North Yakima Fruit Growers' Association has ordered an assessment for the support of the growers' council.

The members of the Douglas County Fruit Growers' Association met at Roseburg, Oregon, and decided to organize a cooperative cannery.

Berry shippers of the Northwest are greatly concerned over the requirements as to size of crates prescribed by the Pure Food and Drugs Act.

Potato growers of South Idaho are endeavoring to stamp out two very serious diseases of that section. They are rhizoctonia and fusarium blight.

Hop men of Oregon estimate the yards of the state this year will not exceed 20,000 acres and that the crop will be less than 60 per cent of normal.

A fruit broker at Seattle, Washington, was recently arrested because of selling strawberries in boxes which were larger than those prescribed by law.

Ninety-five per cent of the fruit growers near North Yakima, Washington, have agreed to market their fruit only through a coperative organization.

One feature of the Celilo Canal opening was the participation by the Northwest Livestock Association in the great parade held at Lewiston last Monday.

An agreement has been effected between the states of Arizona, Colorado, New Mexico and Texas, through which the free movement of cattle is permitted.

Can you twist the tugs of your harness like that? Flexible harness is strong harness. Keep it pliable and it will give you good service for years.

EUREKA HARNESS OIL

is your best harness insurance. It keeps tugs, straps, etc., pliable and strong—just as they were when you bought them. Unoiled harness becomes brittle and unsafe. It will pay you to have your harness dealer dip your harness occasionally in Eureka Harness Oil. Or apply it yourself by hand. Dealers everywhere.

RAISE A PIG.

If you wish to own an auto that
Will travel fast and far,
Raise a pig;
If you have a dear desire for a
Splendid private car,
Raise a pig.

If your daughter yearns for jewels,
That will make a lurid blaze,
Or your wife would be a leader
Where some other matron sways;
If you wish to give up toiling and
In comfort spend your days,
There's a way—don't overlook it—
Raise a pig.

If you're sick of serving others and
Are looking for a change,
Raise a pig;
If you wish to gaze at wonders
That are far away and strange,
Raise a pig.

If your son would like to squander
Money on a chorus girl;
If you yearn to own a castle, having
Walls inlaid with pearl;
If your youngest daughter wishes
To be married to an earl;
There's a way—don't overlook it—
Raise a pig.
—Northwestern Stockman and Farmer.

SILAGE FOR SWINE

Written for California Cultivator
By Geo. H. Bancroft

NOT having had personal experience in feeding silage to swine, I have written to authorities on the subject and give below extracts from the answers received. These, I believe, will be valuable.

The editors of The Country Gentleman write, March 19: "Silage is not usually considered a very good feed for swine. It is too bulky. The hog's digestive apparatus is not designed for handling large amounts of bulky feed. Some feeders have found some advantage in feeding just a small amount of silage to hogs as a sort of appetizer. A pound or two a day is about all the silage that they feed. Corn silage will do very well for this purpose."

Richard A. Haste, managing editor of Campbell's Scientific Farmer of Billings, Montana, writes, March 17: "Corn silage has not proved of any special advantage in hog feeding. Alfalfa and the clovers containing a large amount of protein are better for the growing pig and a more concentrated food is better for finishing the product. The trouble with silage as a hog feed is that it is too much of a roughage and not concentrated enough for pork production. However, where alfalfa is not available a combination of carbohydrates and proteids ensiled would doubtless be an economical hog feed."

The Kansas state agricultural college at Manhattan writes per W. A. Cochel, March 11: "We have never made a complete test of alfalfa silage for brood sows because of the fact that it has been almost impossible for us to make a good grade of silage from alfalfa. Hogs will not be able to utilize silage made from corn, kaffir, Sudan grass, barley seed, oats and rye. The great difficulty in feeding silage to hogs is that it is so bulky that they are not able to consume any great quantity of it. It may be that you could maintain brood sows on it fairly well, but it has very little productive value."

The Frost Publishing Company of Chicago, per John F. Myers at San Francisco, writes March 23: "In the classification of feeds silage is classed as a roughage and hogs are not adapted to the handling of much roughage in their ration, so silage can hardly be classed as a hog feed. Alfalfa pasture during the growing season and alfalfa hay during the months that alfalfa cannot be pastured will make much cheaper and better food for hogs than silage.

"When pasturing alfalfa or feeding alfalfa hay at least a half ration of grain should be fed for best results. It might be a good experiment to try out a little silage on a few brood sows. It is impossible for a hog to even get a maintenance ration from silage alone."

American Farmer's School, Minneapolis, Minnesota, per H. G. Parkinson, writes March 9: "There is but little experimental data on the comparative values of silage for feeding swine. There is one thing about silage for swine that is desirable, and that is the fact that it is a good succulent roughage, although we cannot feed large quantities to our herd because of the fact that their digestive capacity is limited and will not take too much. With broow sows, if they are beginning to get heavy with pig, it would not be wise to crowd them with too much roughage of this character. For hogs that you are wintering and for brood sows too, as well as young growing pigs, some silage is undoubtedly beneficial. The amount that you feed will depend upon the kind of hogs to which you are feeding it and their condition.

"I would not advise feeding any quantity of silage to hogs which you wish to fatten, because when you are fattening a hog you are feeding him about all of the concentrate that he can care for anyhow. Silage too compares very favorably with pasture. 'Canned pasturage' is really a very good name for silage."

S. J. Craig, Lake County agricultural agent, Crown Point, Indiana, writes, March 3: "In speaking about 'canned pasturage' in reference to silage you give your own explanation on that when you say that the hog has a very small stomach. You cannot supply mature corn to the hog through silage as profitably as you can harvest the corn and feed it to the hogs by itself on the point you have already mentioned, which is that the hog has a small stomach."

American Swineherd Publishing Company, Chicago, Illinois, per Jas. Baynes, writes, March 4: "You need something besides silage, but it comes in all right. But out in your country I suppose you have green stuff the year round. If you can grow corn silage you can make all the silage, and soja beans are extra good. Also rape is great hog growing stuff, and alfalfa if you can raise it. It is the cheapest feed, but you must have some grain to balance the ration. If you can raise barley or wheat or kaffir corn or maize, you can balance it all right. They are making a big business in Colorado with the beans and alfalfa and barley."

F. W. Woll, professor of animal nutrition, University Farm at Davis, California, writes, March 8: "Replying to your question, I would say that silage from either Indian corn or sorghum or other crops is not especially adapted for feeding swine, for the reason that it is too bulky, and these animals cannot derive sufficient nutriment from the silage to make much gain. Silage, however, is used to some extent by swine breeders in different parts of the country, being fed in small quantities, and especially to brood sows, and in this case is used more as an appetizer and to regulate the system than for the nutriment it contains.

"I have no doubt but that you will find rape a very valuable feed for pasturing hogs, and cow peas and soy beans will very likely also do well on your land and prove valuable swine feed."

In addition to the above we have the following from the different scurces quoted:

Clayton Messenger, proprietor of the Hampshire Farm in Iowa, and an extensive raiser of hogs, at one time did not believe in silage for swine. An experiment convinced him, however. They were very greedy for it and squealed lustily for more. The consequent thrifty appearance of his stock has induced him to plan a hog silo

When writing advertisers, mention the Cultivator.

as he is convinced that silage has a place in feeding swine.

Wm. Smiley and Son, Albany, Wisconsin, tried the experiment of feeding their herd of big type Poland-China sows on silage at the rate of one and a half bushels to five sows, the ratio of feeding value of corn silage to corn being about 1:5, but its feeding value to the sows was more than that, as it kept them in fine condition and helped in farrowing. In winter silage is fed twice per week.

The Silver Manufacturing Company of Salem, Ohio, found through investigation that the testimony concerning the value of silage as a feed for swine is conflicting. Col. F. D. Curtiss, an authority on swine, states that silage is valuable to add to winter rations of swine. It keeps up the flow of milk of the sows that are nursing the young, equally as well as when they are running on clover. Dr. Bailey fed large hogs 10 pounds of silage and one pound of wheat bran with good results at a cost of two cents per day. He states that clover silage would require no grain in addition. Feeding experiments conducted at the Virginia experiment station show that silage is an economical maintenance feed for hogs when fed in connection with corn, but not when fed alone.

United States Farmer's Bulletin No. 32 states that "Numerous attempts have been made to feed swine silage, but generally without success. In some cases swine have gained something, probably from the grain that might be present in the silage, but the available data do not as a rule demonstrate satisfactory results from such feeding. The Utah station reports as a result of experiments that silage is unfit for pigs and they do not like it. At the New York station feeding results in this line have yielded entirely unsatisfactory results. Henry reports that he repeatedly tried corn and clover silage as a food for swine, but without success. The Virginia station, however, reports fairly successful results with corn as a cheap maintenance ration for carrying brood sows over winter, but not for fattening.

The above data give somewhat conflicting verdicts as to the value of silage as a feed for swine.

The writer believes with Mr. Haste that a combination of plants containing a rich proportion of carbohydrates and proteids ensiled would be an economical hog feed. The difficulty of ensiling plants rich in food values will no doubt be overcome in some manner, perhaps by partly wilting or drying the green forage before cutting or shredding for the silo.

If "canned pasture," or silage, is of the same, or about the same, food consistency as green grass or crops in the pasture used for grazing hogs, for instance rape, then some method of forcing the hog to take a reasonable amount of exercise while consuming silage would be well worth trying.

Lately means have been contrived to force the hog to exercise while feeding after the same or similar manner as poultry are compelled to scratch in a deep litter or work some mechanical feeder when they are hungry.

In other words, if rape is of such great value as pasture for swine, then the "canned pasture" should be good if accompanied with about the same degree of exercise.

We are convinced that silage can be used to advantage in feeding swine, but it evidently cannot be profitably used unless in connection with some more concentrated food. The proper proportion of solid grains to silage in the ration is the problem. We are convinced that we do not have the last word yet upon this subject.

PRODUCTIVE FEEDING OF FARM ANIMALS

"Productive Feeding of Farm Animals," by F. W. Woll, Ph. D., Professor of Animal Nutrition, University of California, published by J. P. Lippincott Company, Philadelphia, $1.50.

Prof. Woll's coming to the University of California has added materially to its teaching force. More, we believe his presence in California will give a stimulus to animal husbandry.

This book, one of the Lippincott Farm Manual series, is adapted to the use of students in agricultural colleges. It will also prove of great value to the live stock producer who wishes fullest information as to feeds and feeding values. We are all reaching for that which will aid us in producing the most with the least expenditure. It is a volume of nearly 400 pages, fully illustrated, with much tabulated information regarding all kinds of feeds. From the introduction we quote:

"A clear understanding of the main principles underlying the nutrition of farm animals has never been more important to the stock farmer than at the present time, with prevailing high prices for feed and labor. In order to secure profitable returns the farmer must be able to adapt these principles to the special conditions that surround him; these are likely to vary in different years, both as to prices and products. Modern industries supply immense quantities of by-products that serve as feed for farm stock, such as flour and oil-mill feeds, starch and sugar factory feeds, brewery and distillery feeds, and others. These differ much in nutritive values as well as in cost. Since better results may be obtained in feeding stock a combination of different feeds than from only one or two, it is important not only to understand the principles of stock feeding, but to become familiar with the different available feeding stuffs, their main characteristics and nutritive properties, as well as their relative values under changing market conditions. Only in this way can the stock farmer secure the best and most economical returns from his feeding operations and make stock raising pay; provided the other factors have received proper attention: Keeping animals adapted for the purpose in view and giving them the care which they require in order to do well."

The following outline of contents will indicate the topics discussed in the book: Introduction, Composition of Feeding Stuffs, Digestibility, Uses of Food Materials by Animals, Description of American Feeding Stuffs, Their Characteristics and Value for Different Purposes, Principles of Feeding Livestock, Feeding for Maintenance and for Production, Feeding Standards, Feeding Livestock Under Ordinary Farm Conditions, Dairy Cattle, Beef Cattle, Hores, Sheep, Swine, Poultry, Appendix, Tables of Composition, Digestibility and Manurial Values of Feeding Stuffs, etc., etc.

COTTONSEED MEAL.

Cottonseed meal contains from 38 to 45 per cent protein and is therefore one of the most concentrated feedstuffs upon the market. There are in fact very few vegetable feeds which have anything like this percentage of protein. Its value has perhaps been more thoroughly appreciated in Europe than in this country despite the additional cost of shipping it abroad. During 1913, for example, about 400,000 tons of the meal were exported to Europe. Much of what remained in this country was used as fertilizer, so that it has been estimated that American cattle were fed less than one-half of the total quantity of meal produced in the country. There is, however, a growing tendency at the present time to use the meal as a supplementary feed. One pound of cottonseed meal is said to be usually worth as much as two pounds of corn for feeding cattle. There is however a distinct limit to the quantity of the meal that animals can use economically. In the South it was formerly the custom to feed steers very heavily on the by-products of the cottonseed oil mills, 12 to 15 pounds of meal a day being a not infrequent ration. Such heavy feeding frequently caused blindness and death, while in other cases the steers after gaining fast in weight for a period of 90 days or more, lost flesh with equal rapidity and could be with difficulty got back into good condition. Experiments have shown, however, that when the ration is kept below seven pounds a day, steers can be fed for 100 to 120 days upon it without showing ill effects. If silage is given at the same time as roughage the feeding of cottonseed meal can be prolonged beyond this time with safety. Silage is a better roughage to use with meal than cottonseed hulls as experiments in several states have shown that it gives larger daily gains and better finish.

The Peer of Them All

The Alpha Forty

No Batteries
No Coil
No Troubles

A Big Hot Spark
A Quick Start
Results

SERVICE—That's what you want most of all in an engine for irrigating purposes. Economy is important, of course, but SERVICE and ABSOLUTE DEPENDABILITY, first, last and always, is the most important consideration. When you buy an ALPHA FORTY you get the "Last Word" in Engine Efficiency.

LONG LIFE in an Alpha is assured by scientific design, intelligently selected material, workman-like construction, correctly fitting parts, efficient lubrication and ABSENCE OF VIBRATION.

ALPHA ENGINES have always been known for these qualities, and the ALPHA FORTY surpasses anything ever before achieved.

EASY TO START AND OPERATE.—Sumter built-in magneto and Madison Kipp force feed lubricator, furnished as regular equipment. Cylinder and piston ground to perfect fit. Mechanically operated valve.

FUEL.—Gas, gasoline, kerosene or low grade distillate. It is also recommended for grist mills, cotton gins, elevators, electric lighting and where heavy, reliable power is needed.

ALPHA ENGINES are built in sizes 2½ to 100 H. P.

THE VIKING ROTARY PUMP, Self Priming.

THE OX WARBLE FLY

Cattle grubs when infestation is heavy seriously affect the gains in fattening cattle and reduce the flow of milk in dairy cattle, states Professor William Hislop, animal husbandman of the Washington experiment station at Pullman.

A case is recorded by Boas in Denmark of an infested dairy cow which, while she remained in poor condition, gave 33 pounds of milk per day. Forty-six grubs were extracted from her back and eight days later she was giving 44 pounds of milk per day. The loss in this case was 25 per cent. The hides of grub infested cattle are so perforated with holes that they are discriminated against when marketed. A green, "grubby" hide is generally worth one cent a pound less than a perfect hide.

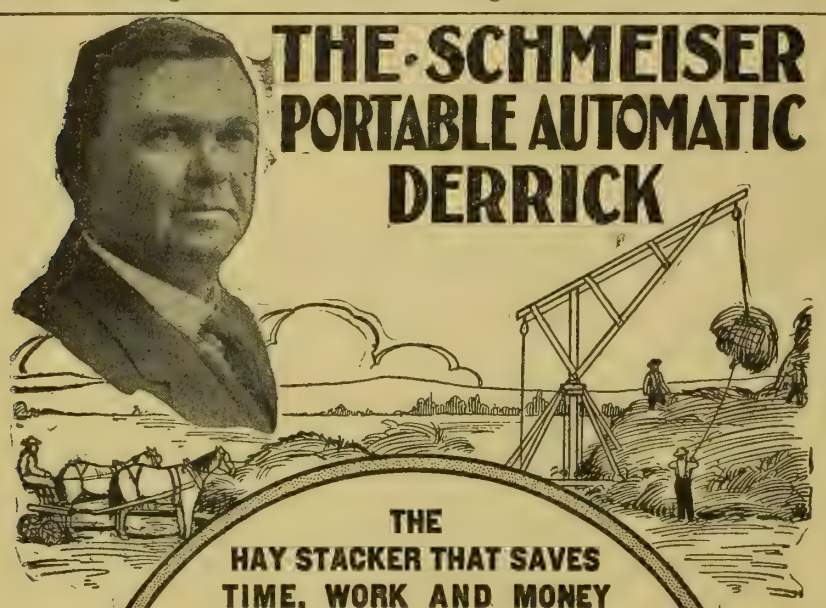
Life History.

The fly (Hypoderma lineata) that causes this grub is variously known as the ox warble fly, the heel fly, or the ox bot fly. During the spring and summer the eggs are deposited on the hairs around the hoof heads, and the animal on licking them carries the eggs or grubs into its mouth. The maggot passes into the gullet and then migrates to the back where it causes a swelling observed in late winter or early spring. In the spring or early summer months the grub emerges from the back of the animal through a small hole previously used for breathing purposes. On falling to the ground and burrowing in it the grub enters the pupa stage which lasts from three to six weeks. At its conclusion a two-winged fly emerges.

How to Combat.

The best method of destroying the grubs when ripe is to squeeze them out and kill them. If the warble is small and firm the grub may be removed by inserting a pair of small forceps into the opening of the tumor. If the opening is too small to permit the entrance of the forceps it may be enlarged by a small incision with a sharp knife. Strong thumb pressure will then force the grub out through this artificially enlarged opening. When removed all grubs should be destroyed, otherwise they may pass into the remaining stages of the life history and ultimately develop into adult flies. After the removal of the grubs an antiseptic should be applied to the affected portion of the hide. Cresol or Zenoleum (five per cent solutions) are excellent for this purpose.

If stockmen would cooperate in the wholesale destruction of these grubs, the pest could be eradicated.



THE-SCHMEISER PORTABLE AUTOMATIC DERRICK

THE HAY STACKER THAT SAVES TIME, WORK AND MONEY

This derrick will handle hay, loose or baled, in the easiest, quickest and most economical manner known. It is always ready, is portable and can be moved from place to place as easily as a farm wagon. With it three men can do the same amount of work as nine men by hand. Has great lifting capacity and is unequalled for hoisting machinery, timbers, or heavy loads of any kind.

WRITE US TODAY and we will send you descriptive and illustrated literature. The Schmeiser Portable Automatic Derrick is not an experiment. It is the result of 25 years of actual experience gained in farming. It is being used with great success all over the Pacific Coast. Write us NOW for full details explaining just what it can do and how it can save you time, work and money. Address

LARGEST SHIPPERS IN CALIFORNIA

PHONES 10969 BDWY 4011 — 1128 1140 SAN PEDRO ST. LOS ANGELES, CAL.

SEPARATOR ROOM HINT.

I find that a very offensive smell arises from the concrete floor of the separator house after we have flushed out the house the night before with water and it is the surplus water and the little milk that is left on the floor that causes the smell. Simply sprinkling a little air-slacked lime over the floor the night before will give a sweet smell in the morning and not that offensive odor.—Shirley Manock, Tulare.

FARM BUREAUS

(Continued from Page 561)

feeds, etc. To carry on such a business a credit rating is necessary and this has been secured by responsible farmers signing demand notes and depositing them in the bank, guaranteeing any indebtedness that the bureau may incur. Already over $4,000 of such notes have been signed up, and a business agent hired by the bureau and prospects look bright for the raising of the full $10,000 before very long."

Glenn County, J. W. Mills, Adviser, Fairfield

Rio Vista, May 4.
Benicia, May 11.
Vallejo, May 14.
Suisun, May 17.
Vacaville, May 19.
Cordelia, May 20.
Dixon, May 26.

At the Rio Vista and Dixon meetings we are going to discuss swine growing. At Vallejo the dairy will be the subject, while at the other places no subjects have been alloted.

We have organized three potato clubs, one at Suisun, one at Rio Vista and one at Vacaville, and a pig club at Dixon.

Maricopa County, Arizona, Jas. A. Armstrong, Adviser, Phoenix

On Tuesday, May 11, a meeting is to be held in the Roosevelt meeting house by the South Side Farm Improvement Association. The subject to be discussed will be the Dairy Cow. It will be discussed by Dr. Norton. Prof. G. W. Barnes will also be present and discuss The Adobe Hole in Its Relation to Contagious Abortion in Dairy Cattle. Farm Adviser James A. Armstrong will also be present to answer any questions that may be asked along general farming lines; especially in relation to the ant campaign which is now in full swing.

On Thursday, May 13, meeting at Lehi with the Lehi Farm Improvement Association. Prof. G. W. Barnes and Farm Adviser James A. Armstrong will discuss the dairy industry south of the river and show the ultimate results to be expected from the Cow Testing Association which is being formed in the Mesa, Chandler and Gilbert district at this time.

At Chandler, Friday, May 14. A petition is being circulated asking the assistance of Prof. Stanley F. Morse in the formation of a Farm Improvement Association at Chandler. This petition is being rapidly signed up by all farmers in that district who are familiar with the work of these associations in other places, the purpose being to improve the social conditions in rural communities and improvement of markets, distribution of seeds, etc., or in general to make use of the facilities offered by the extension service of the University of Arizona and the United States department of agriculture.

This meeting is to take place in the Chamber of Commerce rooms, Friday, May 14, at 2:00 p. m. Prof. Stanley F. Morse in charge of extension work of the University of Arizona, will be present, as well as Farm Adviser James A. Armstrong, and possibly Live Stock Specialist G. W. Barnes.

On the evening of May 15, a meeting of the Gilbert Commercial and Country Club will be held in Gilbert. Prof. Stanley F. Morse, with the University of Arizona extension service, and Farm Adviser James A. Armstrong will be present, and possibly Live Stock Specialist G. W. Barnes.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Fodder Poisoning

Sheep fed on hay stagger and finally lie on the ground with the head pulled back. There is a discharge of mucous from the nose. When placed on their feet they stagger forward and root their nose in the ground and then fall. Within five or six days they die. On cutting open the stomach a substance was found resembling dirt. I thought it possible that it was caused from some poison or weed in the hay but know of no such weed here.—Subscriber, Vacaville.

It acts like spinal meningitis caused by fodder poisoning, not from a poisonous weed in the hay but from a mould or fungus on the hay caused by dampness. The best remedy would be a physic. Mix four ounces Epsom salts, two ounces common salt and half a dram of powdered nux vomica. Dissolve it all in a pint of warm water and give at one dose as a drench. Be careful in drenching and in the amounts of the medicines. The nux vomica is poison, but given as directed will be all right.

Bloody Milk

Cow gives bloody and clotted milk from one-quarter without apparent cause. Please tell me what to do.—Subscriber, Merced.

Thin the cow's blood by giving Epsom salts two pounds, common salt one pound and nux vomica three ounces. Mix and give a handful in a little feed once a day. Bathe the quarter of the udder that gives the bloody milk with warm water and rub it carefully with the hands and be sure to milk it out clean every time.

Alfalfa Ball

Mare has what veterinarian calls alfalfa poisoning from wet, dusty alfalfa, or alfalfa ball. Gave arsenic but it does not seem to help her. What should I give her? She does not seem to have much use of her hind legs.—Subscriber, Merced.

If the horse's bowels are clogged with alfalfa that is rolled up in balls as it sometimes does, our answer will probably be too late to do much good. The horse should have had a very active physic. The veterinarian should have given arecaline, but you might have given a physic of one quart raw linseed oil, two ounces of turpentine and three drams aloin at one dose. The arecaline you could not get nor give, it is given under the skin with a hypodermic syringe.

Poultry for Profit

PREVENTING DISEASE

Written for the California Cultivator
By Jean A. Koethen

AN ounce of prevention is worth a good deal more than the proverbial pound of cure in the poultry yard. In fact an Irishman would probably say that prevention is just about all there is to curing disease anyhow, and he wouldn't be far from wrong, only the American way of putting it is more conservative and therefore less emphatic. We may be very sure of this, if there is disease in the poultry yard, it is somebody's fault, and while there may be remedies, they are only makeshifts and the real cure is to find out what is wrong and as speedily as possible to right it.

The word we use nowadays for all sorts of disease prevention is a word that is used so freely in all localities and by almost all sorts of people that it has become a word to conjure with. It is the word that puts up quarantine signs and causes careless milkmen to be arrested and fined and puts drinking fountains in school yards in place of the old disease-spreading water pail and forbids spitting in public conveyances and does a whole lot of things that never were thought of when some of us were children. This same word is conjuring disease away from hen yards and weaving a magic spell that keeps every fowl red-combed and vigorous, only men have been slow to realize that their fowls are not essentially different from themselves in their requirements, and the Herculean task is only commenced. I mean sanitation, a good Latin word, which means health-making, and that is precisely the same thing as preventing disease or curing disease.

Preventing Roup

When we think of diseases of fowls we naturally think of roup first, for it is a monster of many heads and without doubt the greatest enemy of fowl health and happiness. There is swell-head, roup of the eyes, diphtheretic roup, roupy catarrh, and all gradations between, from a swollen-shut eye down to real diphtheria with its false membranes and often speedy death. Roup often appears in the beginning like a common cold, with a thin discharge from the nostrils, which soon becomes thick and soils the feathers where the bird tries to wipe it off, or there is a sticky look about the eye, or perhaps the eye is closed or swollen or both. Sometimes the birds eat well and seem little inconvenienced by their malady, but in more severe cases they mope and refuse to eat, and when the disease takes on its most virulent forms they remain quiet, with ruffled feathers and closed eyes, and soon die.

I have mentioned these symptoms of roup because it is extremely important to recognize them at the very beginning. One single symptom is a danger flag, a warning that there is something wrong, either in the sanitary condition of the premises or in the constitution of the bird. In searching for the cause of an outbreak of roup, though it be but a single case, I should look to

Housing

The most important thing about a sanitary poultry house is that it admits the sun. Lack of sunshine means vermin and mold and disease germs. You know the difference between roup and a cold is that roup is a germ disease—at least so the doctors say. We speak of roup being caused by bad ventilation, dampness, etc., but it would be more correct to say that these things lower the tone of the system so that the deadly, ever waiting germ may get in its work. The germ may have been left in the house by former outbreaks of the disease or it may have been brought in by a newcomer. In any case sunshine, aided by disinfection, destroys it and keeps it out. It is for this reason that a south front is considered the best for poultry houses. A south front, open to the sun, and with a roof so high that it admits the sunshine to every farthest corner, is the first step in the prevention of roup.

The second essential to a sanitary poultry house is ventilation. In winter the open front, with back and sides tightly closed, may admit a sufficient amount of oxygen, but it does not provide for circulation of air to dry out any possible moisture. In long-continued rainy spells if droppings are left for a few days on an earth floor, they are almost sure to mould, and unless the house has a tight foundation the earth becomes damp and remains so. A window at the rear of the house, which can be opened between storms, provides circulation of air which quickly dries up this dangerous moisture.

The matter of housing poultry so that it may have necessary protection without drafts, and yet be supplied with pure air, is by no means as easy as it looks. On some of the most up-to-date ranches I have seen the roosting houses are built with two sides open, the one into the scratching-shed, the other directly out of doors. A few hens in a small colony coop will do well enough with air from the front only, but a large flock needs more air than this except perhaps in cold, stormy weather. A good test of the ventilation facilities of your house or coop is to go to it at night when all the birds are inside, and see how you like the smell. It would be going too far to say that there should be no odor, for even the cleanest, most carefully ventilated quarters will have some, but if there is a heavy, stuffy, noisome air, believe me, you will have roup in your flock if you have none now.

Of course, if there are too many hens in your house you cannot have pure air unless the conditions are almost those of outdoors, and this brings me to the third requirement of a house, which is that it be large enough. It is generally agreed that 3½ square feet of floor for Mediterraneans or 4 to 5 square feet for heavy breeds is about right, but it is safer to have four for Leghorns and five for heavier birds. Even then the number may be too great if the house is not well planned. Hens throw off the moisture of the body through the lungs instead of through the skin, and a close, crowded house too often becomes a veritable sweat box. If on your evening visit to the roosting house you find that it seems hot, be sure the hens find it quite as uncomfortable as you do. The fact that hens will always roost in trees if they can is a pretty fair indication of the sort of air they like to breathe. "It seems queer to me," remarked a carpenter who had built a house for the family and was now constructing my henhouse after what seemed to him an unnecessarily protective design," you want so much air yourself, but you aren't willing your hens should have any." I took the hint and since then have tried to give my hens as much air as I like myself.

Cleanliness

A **prominent poultry** breeder, who was recently asked what he considered the first essential to successful poultry keeping, replied, "Cleanliness." But what has cleanliness to do with roup? Just this: the presence of unremoved droppings week after week must inevitably vitiate the air. Some poultrymen clean out the droppings daily, but most find twice a week sufficient. Where droppings-boards are used I think a house needs cleaning rather oftener than when the droppings fall into soft dirt, but twice a week is none too often. Some authorities advise the use of air-slacked lime on the droppings boards, but I have found clean dirt entirely satisfactory. Its use would be too troublesome in a large plant, but a large plant should have cement floors which can be washed often with the hose.

I would not like to say that roup is caused directly by filthy soil in poultry yards and runs, but gapes and intestinal worms and scaly leg are, and I can hardly imagine that hens enjoy scratching in it, so why not spade it up once in a while and plant something? If barley or oats are buried far enough below the top of the ground they will be up before the hens have found them, and even this little growth helps. Of course a system of double yards is better, and I expect to see the day when no poultryman with any self respect will grow fowls without giving them some chance to nibble at green growing things, or will keep them year after year in the same bare runs.

(Continued next week.)

SICILIAN BUTTERCUPS

Dr. A. B. Woodhull is an enthusiast for what she terms "one of our very heaviest producing breeds of poultry." This is the Sicilian Buttercup, comparatively little known and yet one of our older breeds. Regarding this breed Dr. Woodhull writes:

"The cock is erect, with as self-important an air as if boasting of royal ancestry. In color he is a rich orange, with black tail and black and red wing flight feathers. The comb is cup-shaped with points around the edge; or may be likened to a crown, and is a distinguishing characteristic. The legs are willow green, body plump and symmetrical, skin yellow, and weight from five to seven pounds.

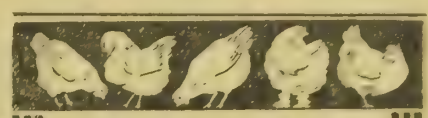
"The hen is golden buff or butter color, rather evenly spangled with black on the back and across folded wings. The hackles should be plain, golden buff; tail and wing flights dark, legs same as cock. Comb same as that of male, but smaller. The carriage is sprightly, accompanied by an air of happy, trusting friendliness that is quite captivating.

"Buttercups are hardy and strong from the shell. They mature very early, sometimes beginning to lay at four months of age. As layers they are unexcelled, not being afraid to compete with any other breed. Individual hens and selected pens have made astonishing records. This great laying capacity is not limited to the first, but continues through second and third years. They waste no time becoming broody, but trust to the incubator to hatch the eggs it is their business and pleasure to produce.

"Buttercups grow rapidly, are small boned and plump, so that surplus cockerels may be disposed of as broilers at two months of age. It is not for table use, however, that they excel; it is for eggs—eggs, winter, summer, and all the year. Sicilian Buttercups are very hardy, mature early, are everlasting layers of rich, well flavored eggs, are practically non-sitters, they combine activity with gentleness, and possess a unique beauty quite characteristic."

ANOTHER CURE FOR ROUP

A subscriber who has tried and found it most effective recommends as a cure for a cold or roup in its first stages the use of three parts cottonseed oil, one part chloroform. Use the ordinary small sized oil can or machine oiler and inject into the nostrils.



COULSON'S EGG FOOD

Contains every ingredient that hens need—mixed just right to give a balanced ration—makes hens lay longer—keeps them healthy—pays for itself by increasing egg production—saves your times—puts money in your pocket.

Scientifically mixed by machinery from a formula based on years of experience.

Caldwell's Royal Red New Zealands scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

WANTED

Wanted—To hear from owner of farm or fruit ranch for sale. O. O. Mattson, Minneapolis, Minn.

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Shares

A owns 250 acres of land, tools and stock, but lacks money for help. A offers to put his labor against B's, each to share one-half of expenses (seed, feed, upkeep and sale of crops). Shares suggested are as follows: Land, stock and tools, one-third net profits; A, for his labor, one-third net profit; B, for his labor, one-third net profit. Is this a fair and just division? We raise barley, corn, potatoes, beans, some truck garden and a little fruit.—Subscriber, Ramona.

This query was answered in the Cultivator of April 15. A second answer is given below:

I should say that the expense agreement is fair enough, that is, A and B should share equally as given. This leaves only the question as to the proportion which should be paid for the use of the land, stock and tools. The decision must rest, it seems to me, on prevailing values for land rental, such as is represented here, taking into account different types of soil, if such are present. This will give the figure which the land should receive. For the use of stock and tools, the matter may be figured somewhat differently. Twenty-five cents per day for actual time stock is used, plus their feed, will probably represent a fair rate for this item. The use of the tools should command a figure equal to a sum representing ten per cent annual depreciation of the original value of the implements and a fair rate of interest on the money invested, say six per cent. It seems to me therefore, that the arrangement should be based on equal division of gross profits after running expenses are deducted, twenty-five cents per day and feed for actual time stock is used, and interest and depreciation of implements.

If it is desirable to set aside a definite proportion for the use of land, stock and tools, it will be necessary to figure the net profits (gross profits less actual running expenses) for crops to be raised, which will give a working basis to determine the proportion that the figure as derived above will bear to the total net profits. In other words it will be necessary to see what the land will do in a rough way, and from the sum thus determined, find the proportion under the going rates of rental, use of stock and implements. If I had all the details at hand, I could of course work this matter out very quickly, but it seems to me that this is the only way by which the matter can be properly handled.—R. L. A.

Wanted, An Ice Plant.

Lemon Cove, Tulare County, wants an ice factory. It is said there is an excellent opening for such a plant in that thriving section.

Barrenness.

I have a heifer which aborted last fall. Since then she has not become with calf. What is the best treatment? Subscriber, Visalia.

The heifer should have the genitals washed out every week with a solution of Kreso or other disinfectant as directed on the bottle or can. If there is infection or discharge this may remedy it and the heifer get with calf. If she did not clean after calving a diseased condition may have resulted which caused a closing of the neck of the womb. This would have to be opened with a dilator. It would be well to have a veterinarian examine the animal and prescribe.—W. S. G.

Traces of Unequal Length

A contends that a horse pulling with one trace shorter than the other pulls most of the load with shortest trace, also that he is apt to get a sore shoulder. Be says A is mistaken in both instances. Your decision settles the argument. Subscriber, East Bakersfield.

Your question does not state how the horse is to be hitched to the load, but we will presume that it is in the ordinary way with singletree and evener and he is to pull with another horse. If the singletree is free to move there will be no difference in the load on either shoulder and the load would not make sore shoulders with a perfectly fitted collar. If there should be so much difference in length of traces that the end of the singletree touched an obstruction, such as the evener, the draft would be changed and chafing caused. The same thing can happen when one horse lags far behind the other.—J. B. N.

Indian Runners

Which is considered best, the white or fawn-and-white Runner duck? How many ducks should run with one drake? What is a fair price to pay for breeding stock, and is there a market in Los Angeles for the eggs?—A. M., Oceanside.

There is not, dealers tell me, either a very great or a very steady demand for duck eggs for table use. Prices are about the same as for hen's eggs, though they vary considerably at different seasons. The best customers seem to be Jewish people and tubercular sanitariums. Four or five ducks is usually considered a sufficient number for one drake. There is probably no difference between the laying qualities of the white and the fawn-and-white Runners, but the latter seem to be more popular. I think one dollar per bird would be a fair price for stock.—J. A. K.

Plums Failing to Bear

What is the trouble with our plum trees? They bloom very heavily but never set any fruit. They are on a medium sandy soil at an altitude of 2500 feet.—Subscriber, Hot Springs, Arizona.

There is not sufficient information to form a correct diagnosis in this case but unless the same variety of plums has been tested in that section and found to bear well we would judge that the variety is not adapted to the section. It is possible at that altitude that white frosts may come at blossoming time to destroy the young fruit, or there may be some other reason. If such is the case then grafting over the trees or replacing with varieties of known productivity is the only remedy. In the meantime it might be well to vary the method of pruning on one or more of the trees, also making an application of nitrate of soda early in the spring before blooming time.

Pear Blight

Am sending leaves and twigs from pear tree which is affected with some disease. Is it pear blight? The tree has been planted three years. It has set a fine crop of fruit but the tender shoots are turning black and drying.—Subscriber, San Dimas.

This is a serious case of pear blight. The only solution is continual cutting of the trees so as to prevent its spread. If this is not done the tree will be destroyed. Cut the affected branches low enough so as to thoroughly remove all blighted tissue. Carefully remove from orchard all diseased portions and burn. The pruning tools should be kept in a solution of bichloride of mercury, two ounces to 15 gallons of water. They should be dipped in this solution after each cutting.

Planting Palm Seeds

Please give me information about planting palm seeds. When is the proper time and how long does it take for them to sprout? Planted some over six weeks ago, but as yet have not begun to grow.—Subscriber Manhattan Beach.

Plant now, and while it is not necessary to soak the seed it is doubtless better to do so. Seed boxes or beds should not be exposed to full sunlight nor should they be allowed to get dry. I have had seeds remain dormant for eight months before sprouting. Few will sprout in six weeks. Seeds of all common hardy palms will grow readily if planted in the open ground at this time of the year. A free sandy loam is a good soil. Tropical palms need special soil and care in glass house with bottom heat.

HIS CONSOLATION

Pat had been told by the doctor that he could live but a few hours, and his wife and assembled relatives and friends asked him whether there was one last wish he would like to have gratified.

"There is," said Pat. "I'd like to hear the village band play once again."

Accordingly the village band gathered. When at last it had played "Say Au Revoir, but Not Good-bye," and had taken its own departure, Mrs. Pat, kneeling at her husband's bedside, asked:

"Can ye die aisy, now Pat?"

"Yis," replied Pat. "I can die aisy now. Hell has nothing worse than that."

ALL THINGS COME

"And what," asked the cannibal chieftain, in his kindest tones, "what was your business before you were captured by my men?" "I was a newspaper man," answered the captive, "An editor?" "No; merely a sub editor." "Cheer up, young man," said the cannibal, smacking his lips, "shortly you will be editor-in-chief."

INCREDULOUS

"I was outspoken in my sentiments at the club today," said Mrs. Garrulous to her husband the other evening. With a look of astonishment he replied:

"I can't believe it, my dear. Who outspoke you?"—National Monthly.

Neighborizing the Farmer

One of the most significant facts of our telephone progress is that one-fourth of the 9,000,000 telephones in the Bell System are rural.

In the days when the telephone was merely a "city convenience," the farms of the country were so many separated units, far removed from the centers of population, and isolated by distance and lack of facilities for communication.

But, as the telephone reached out beyond cities and towns, it completely transformed farm life. It created new rural neighborhoods here, there and everywhere.

Stretching to the farthest corners of the states, it brought the remotest villages and isolated places into direct contact with the larger communities.

Today, the American farmer enjoys the same facilities for instant, direct communication as the city dweller. Though distances between farms are reckoned in miles as the crow flies, the telephone brings every one as close as next door. Though it be half a day's journey to the village, the farmer is but a telephone call away.

Aside from its neighborhood value, the telephone keeps the farmer in touch with the city and abreast of the times.

The Bell System has always recognized rural telephone development as an essential factor of Universal Service. It has co-operated with the farmer to achieve this aim.

The result is that the Bell System reaches more places than there are post offices and includes as many rural telephones as there are telephones of all kinds in Great Britain, France and Germany combined.

The Household Department

MAY IS BUILDING HER HOUSE

May is building her house. With apple blooms
She is roofing over the glimmering rooms;
Of the oak and the beech hath she builded its beams,
And, spinning all day at her secret looms,
With arras of leaves each wind-swayed wall
She pictureth over, and peopleth it all
With echoes and dreams,
And singing of streams.

May is building her house. Of petal and blade.
Of the roots of the oak is the flooring made.
With a carpet of mosses and lichen and clover,
Each small miracle over and over,
And tender, traveling green things strayed.

Her windows, the morning and evening star,
And her rustling doorways, ever ajar
With the coming and going
Of fair things blowing,
The thresholds of the four winds are.

May is building her house. From the dust of things
She is making the songs and the flowers and the wings;
From October's tossed and trodden gold
She is making the young year out of the old;
Yea, out of winter's flying sleet
She is making all the summer sweet.
And the brown leaves spurned of November's feet
She is changing back again to spring's.
—Richard LeGallienne, in "Harper's Magazine."

A WALK IN THE RAIN

By Alfred D. Robinson

I HAVE been for a walk in the rain, not purposely for I was too ignorant for that, but because muddy roads had relegated the auto to an infrequent ease of contemplation of its own smell, and the sun had broken through the clouds for a delusive few minutes. All the extra accoutrement usual to an expedition when it has rained, is raining or may be about to rain had been mislaid, so I sallied forth unencumbered by anything that might remind me that I really ought not to have come. When the sun had lured me exactly half way between home and my destination, he hid behind a cloud and said to it "now you have him" and that cloud promptly began to sprinkle. A trifle annoyed I hurried along sheltering my basket of perishable freight under my coat, and was inclined to quarrel with fate when, my errand accomplished, I found it still raining. I considered my well-worn shoes, that a Belgian might have disdained, my jacket that even the maker had never guaranteed rainproof, my futile little cap that had already skillfully directed its drips down my neck and thought "If I am to get wet, here goes," and I sallied forth thinkiing myself the old fool that has no counterpart.

No sooner had I started than my attitude changed. I felt that the countless nature fairies who revel in the rain had bidden me to their feast and my interest wandered outside my unimportant self. The rain was soft and warm, it beat upon my face and hands like the caress of loving fingers, and I smiled as the thought occurred, how good for the complexion. The path led over a hill still covered with the aromatic wild shrubbery and every little bush and plant was smelling its very sweetest. At the back of the last house a Leghorn pullet perched on top of a wild mahogany bush, and her comb was aflame with appreciation of the weather. A rabbit sat on the path ahead and washed his face, evidently reluctant to leave the job and make way for the man. With a whirr, a covey of quail crossed so close that the movement of their wings could almost be felt and alighted within a handspring, leisurely disappearing in the brush. A California flicker flew past in long dips crying his call and a flock of little canaries rose up to him out of the chaparral and asked what was the matter. Then half a dozen meadow larks executed a half circle, showing their yellow breasts with the maroon horseshoe and settled again, the white feathers in their tails vanishiing last in the tall brown grass of last year. All these chaps were so happy because of the rain; they were out in it because they loved it, not simply for what it meant in grass and grubs in the future, but for the feel and joy of it in the present. They called to one another, "It's raining, come out and play," and their spirit raised me out of my shoes that now were frankly sodden and had given up any pretense of keeping out anything. Under the old-man bush I saw the yellow violet running and making leaves, beside it the shooting star was building its whorl and a hundred green things were growing with all their tiny might as if to say "Let us make growth while the rain rains, for the dry summer comes when no plant can grow."

I stooped and plucked a white forget-me-not and put it in my buttonhole and laughed to feel my coat wet: the tiny blossom further opened my eyes

Timely Advice to Mothers

For Children's Lunch

All healthy children require something to eat now and then between meals. The careful mother, solicitous for her little ones' health, shrinks from giving them too much cake, cookies, and similar dainties which most children appear to like best. The most satisfactory substitute—one that is thoroughly wholesome and nourishing—is good home-made bread thickly spread with Karo Syrup. Nothing can take the place of Karo for this purpose. It is clear and sweet as honey, without the cloying quality which makes honey distasteful to some, and unwholesome if eaten freely. You can give the little tots Karo spread thick on bread without the slightest hesitation. They will not only relish it keenly, but will actually thrive upon it.

You can also use it as an accompaniment for waffles and griddle cakes, as well as in the preparation of puddings and gingerbread, while the candies made from it are pure and delicious.

If you have not yet tried Karo Syrup, order some from your grocer today and make the children happy—just as thousands of other mothers are doing all over the country. Insist, however, upon Karo—it costs no more than ordinary syrups, and is superior in every way.

so that I could see; the bloom of the wild mahogany caught my attention, and also a patch of purple nightshade bordering the path; over on one side three Blackeyed Susans made a speck of color in the sea of green. I stepped off into the grass to investigate a fleck of pale yellow under a bush and found it a nasturtium strayed from the haunts of men and very frightened to be out in the rain, just as if it were a human, and later I came on oxalis and sweet alyssum also straying.—California Garden.

Various Uses for Cornstarch

Interesting Facts Regarding This Delicious Food Product

The average housekeeper would be greatly surprised at the wide range of uses developed for cornstarch in the preparation of various foods and delicacies. In fact, it has become an indispensable adjunct to present day cooking. Every housekeeper, therefore, should become thoroughly familiar with its use.

For instance, in making pastry, cakes, etc., by simply adding cornstarch to her regular bread flour in the proportion of one part cornstarch to three to five parts flour (according to the amount of gluten in the bread flour she is using) the housewife can prepare a pastry flour of the finest quality—one which will insure a soft, fine texture to the pastry, and eliminate the tendency to toughness prevailing where straight wheat flour is used.

Most pleasing results can also be obtained by using cornstarch in the making of custards, shortcakes, waffles, chocolate eclairs, and dozens of other delicacies—but to insure the results desired, it is absolutely essential that the best quality of cornstarch be used. Housekeepers all over the country who obtain the best results with cornstarch recipes always depend upon Kingsford's. This brand is carried by all modern grocers, and costs no more than ordinary kinds. Order a package of Kingsford's today, and ask for their book of recipes.

Almost Driven Out of Business by Ants

How a Los Angeles Grocery Store Conquered This Aggravating Pest

Anyone who has ever suffered with a place overrun by ants will appreciate the experience of a prominent grocery man in Los Angeles, who was almost driven into giving up his business by this aggravating pest. He had tried various methods of exterminating them without success, until a remedy devised by a baker in the same city—who had had a similar experience with ants—was brought to the groceryman's attention, with most remarkable results.

All sufferers from ants will be interested to know that this remedy is being put up for general use under the name of Kellogg's Ant Paste, and can be obtained at any drug store. Each package has a patent rattle cap, which assures the purchaser that it is the original article, and provides a warning day or night that the contents are poisonous.

Insist upon Kellogg's, and make sure that it has the patent rattle cap.

HOUSEHOLD QUERIES

Coloring Carpet Rags

Please give directions for coloring carpet rags. Wish to color green, yellow, brown, blue and red.—Subscriber, Santa Ana.

Tear and sew the rags and wind in skeins before coloring. We have found best success in coloring carpet rags by the use of Diamond dyes. Prepare the dye bath according to directions given on the envelope, making a separate bath of course for each color. Immerse the rags and stir frequently to prevent the color setting unevenly. Allow the rags to cool, then drain off the dye and rinse thoroughly. Hang out to dry, being careful not to allow the hot sun to strike them and bleach them out. When thoroughly dry wind in balls. For a heavier rug and to secure a pretty effect in the weaving twist the rags by winding two balls of contrasting colors together, and then winding back a second time. Rags sewed "hit and miss" are also much prettier and more serviceable if the rags are twisted, the borders and fringe of course to be of a solid color. For a "Dutch blue" use one package of light blue and one package of dark blue (navy) dye.

IDEAS FOR THE COOK.

Written for the California Cultivator.
By Isabel Cottle.

Breakfast

Prunes in Syrup
Cornmeal Mush Cream
Egg Toast Bacon
Coffee

Lunch or Supper

Creamed Salmon Baked Potatoes
Asparagus
Cottage Cheese Green Onions
Rock Cakes Tea

Dinner

Pot Roasted Pork Chops
New Potatoes in Cream
Spinach with Egg
Fruit Salad Graham Rolls
Prune Cake Coffee

Egg Toast.

Melt one rounding tablespoon butter, add one tablespoon flour. Stir until smooth and add gradually two-thirds cup rich milk or cream and salt to taste. Let boil, remove from fire and add chopped hard-boiled whites of two eggs. Pour over squares of hot buttered toast and sprinkle over top of each piece the hard-boiled yolks of eggs run through a sieve.

Pot Roasted Pork Chops.

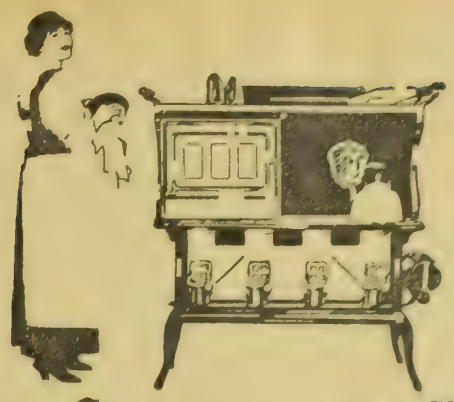
Choose neck or shoulder chops only medium fat and somewhat thicker than usual. After browning the chops on each side in the frying pan add an onion, cut fine, and pepper and salt. Then cover with water and let simmer on the back of the stove for about an hour and a half. Sprinkle in a little flour to thicken the gravy, and serve.

Prune Cake.

Beat half a cup of butter to a cream; gradually beat in one cup of sugar, the beaten yolks of two eggs, half cup of nut meats and one cup of cooked prunes, cut in bits, and, alternately, one cup of the liquid in which the prunes were cooked and two cups and one-half of sifted flour, sifted again with one teaspoon of soda. Lastly, beat in the whites of two eggs beaten dry. Bake in a pan 7 x 11 inches about half an hour. Cover the inverted cake with boiled frosting. A teaspoon of cinnamon may be added to the cake if desired.

Rock Cakes.

One and one-half cups sugar, one and one-half cups walnut meats, one and one-half cups seedless raisins, three cups flour, one cup butter, one scant teaspoon each of cinnamon, allspice, ginger and cloves, three eggs, one teaspoon soda dissolved in a little water.



Gas-Stove Convenience with Kerosene

A good oil stove is like a gas stove—ready at the touch of a match. Any degree of heat you want *instantly* by simply raising or lowering the wick.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Burns oil, the clean, cheap fuel. It roasts, toasts, broils, bakes—better than your kitchen range. No wood, coal or ashes to lug—no soot or dirt—no odor—does not taint the food. And your kitchen is always *cool*. Several sizes and styles. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

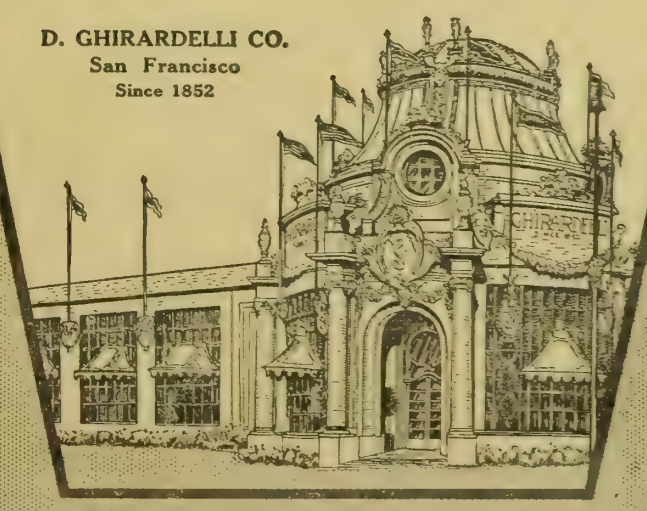
STANDARD OIL COMPANY
(California)
Los Angeles

There is no secret about the making of

Ghirardelli's Chocolate

Visit the building at the entrance to the Zone at the Panama-Pacific International Exposition and see it made—the ingredients are pure—the manufacture cleanly—the description interesting.

D. GHIRARDELLI CO.
San Francisco
Since 1852



FRUIT GROWERS HEADQUARTERS

When in Los Angeles, stay at Hotel Clark. Ideal location. One-half block from Central Park. Close to all stores. Extremely reasonable rates. 555 rooms with bath. Excellent grill service—popular prices.

Hill Street Between 4th and 5th.

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, May 12, 1915.

HAY

Under date of May 8, Scott, Magner & Miller say:

Receipts of hay amounted to 4219 tons for the week ending today. The market is easier than it was a week ago at which time there was a slight feeling of firmness. There is active demand for fancy quality.

The recent rain has been most beneficial to the late sown grain, but has damaged the first cutting of alfalfa and

WEATHER CONDITIONS

May 8, 1915,

Citrus Fruit Market

Los Angeles, May 12, 1915.

Notwithstanding storms stopped picking in many of the orchards enough fruit has gone forward so that more than 1000 cars of California oranges were disposed of last week and the price is materially in advance of that of a week or two weeks ago. The weather of the present is permitting picking in all sections and navels will probably be cleaned up within the next week or two. Valencias are beginning to go forward.

The lemon market is rather stronger and the large quantity in packing houses will soon be going forward. If some good old summertime weather can be secured over the East the large amount in California packing houses will soon be disposed of. The receipts of Mediterranean lemons at Eastern ports has been rather lower during the past few weeks, this because of the war situation, but if present rumors as to the settling of the trouble between Italy and Austria prove true it is presumed that shipping may be released so that immense quantities of foreigns may soon be coming.

Shipments

Shipments of oranges from Southern California since Nov. 1, 1914, to date: 22,029 cars; lemons, 3148; total, 25,177. Last year to same date: Oranges, 23,264; lemons, 1299; total, 24,563. Tulare and central counties: Oranges, 5242; lemons, 192; total, 5434. Last year to same date: Oranges, 4723; lemons, 30; total, 4753. Northern counties: Oranges, 628; lemons, 2. Last year to same date: Oranges, 398; lemons, 5.

NEW YORK, May 10. — Thirty-five cars of Navels, one Navelencias, four budded, three sweets, one bloods, three mixed cars and two cars lemons sold. Oranges strong, higher; lemons unchanged.

"I think I will take my phonograph along when I take my vacation," said Mr. Homely.

"That's a good idea," assented Mr. Nextdood. "It certainly needs a vacation."—Cincinnati Enquirer.

THE CORN EAR WORM

A farmer in northern Arizona set a commendable example of preparedness for combating insect pests in writing recently for advice in regard to the control of the corn ear worm. Concerning this the following statement has been prepared by the station entomologist, Dr. A. W. Morrill.

"Sweet corn is attacked in two places by the corn ear worm. The young growing plants are attacked in the bud. This results in holes being cut in the leaves but it is supposed that there is no effect of this attack upon the productivity of the plants. When the silks appear the adult moths greatly prefer to lay their eggs upon these silks and the attack from this time on is almost entirely limited to the corn ears.

"Frequently from 50 to 100 eggs are laid upon the silk of a single ear. Many of these eggs are parasitized and few of the worms which hatch from them ever become established in the tip of the ear. Of those which do become established it is rare that more than two grow to full size, owing to the fact that they are subject to the attack of certain wasps and other natural enemies, and especially to the fact that they are cannibalistic and whenever two of the worms meet one is almost invariably destroyed.

"The problem of protecting the young ear from infestation consists in poisoning the apex of the ear where the newly hatched worms first begin to feed. This may be accomplished by using a half and half mixture of powdered arsenate of lead and flowers of sulphur. A small pile of this mixture, perhaps a quarter of a teaspoon, should be placed either with a perforated tin can or with gloved hands on the silk so that this mixture will gradually sift downward onto the ear of corn. By this means it has recently been shown in experiments conducted in an eastern state that about three-fourths of the corn ears may be protected from infestation.

"When the bud of the growing plant is severely attacked, poisoning is sometimes resorted to in order to reduce the numbers of the next generation of worms which give most of their attention to the ears. The same poison mixture mentioned above is applied. The leaves are opened at the bud and a little of the poison sifted in by means of a perforated tin can as suggested for use in poisoning the silks.

"Aside from the foregoing direct methods of protecting sweet corn against the ear worm attention should be given during the winter season to thoroughly plowing and harrowing land which has been planted in corn during the previous season. The insects spend the winter in the ground in pupal cells. When these are broken up by plowing and harrowing many of the worms are exposed to attack by birds and to the action of frost. Others are buried in such a manner that the adults when they appear are unable to reach the surface."

Little Stories of Success

No. 7

"To see ourselves as others see us."—We had such an opportunity the other day in a letter the manager of the Santiam Fruit Colony wrote a prospective purchaser in answer to his inquiry regarding the Caterpillar "30." Here are a few characteristic paragraphs:

"*Regarding track item:*—Of course, there is an expected amount of wear, but the splendidly arranged adjustment takes care of this quite satisfactorily."

"*Engine speed:*—There is little chance for improvement in the relative working of the motor and the traction, as it seems to be splendid."

"*Cost per acre:*—We have averaged about 18 acres per day discing and about 8 to 10 acres plowing."

"If you are going to buy a tractor, our opinion is that you will make no mistake in selecting a Caterpillar."

Let us give you the name of a Caterpillar owner near you, and then see for yourself what he'll write you.

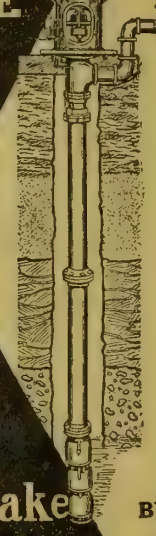
A Better Make Not Made



For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

This announcement tells you how to secure

Your Water Supply at Small Cost

At last—a high-grade, efficient, dependable centrifugal pump at a low price. The **Bean Irrigator** introduces a new standard of pump values. Though the price is as low as the lowest—the pump is "**Bean quality**" through and through. If you're interested in irrigation you should learn about

Bean Centrifugal Pumps

For Downright Good Service They are Absolutely in a Class by Themselves

The Bean Automatic Water Balance eliminates end-thrust, thus saving much trouble.

The Bean Water Sealed Stuffing Box makes excessive tightening of the stuffing box glands unnecessary. The shaft where it enters the pump is entirely surrounded by water, which forms a perfectly air-tight seal with very little friction.

Bean Runners are Enclosed, accurately machined and perfectly balanced. This means greatest possible efficiency.

SEND FOR BEAN CATALOG 28-B

It illustrates and describes the Bean line of Horizontal and Vertical Centrifugal Pumps, Bean Turbines, Direct Connected Outfits, etc. Tell us your pumping requirements. The experience of our irrigation specialists is at your command. For our general line of House, Windmill, and other Pumps, ask for **Catalog 28-D.** For Bean Opposed Gas Engines ask for **Catalog 28-C.** A postal will bring any or all of these catalogs by return mail.

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIV No. 20 LOS ANGELES: THURSDAY, MAY 20, 1915 One Dollar Yearly

Col. Ben F. Rhoades, Auctioneer, and the McAlisters

Left to right: G. A. Smith, Holstein breeder of San Jeaquin Valley enjoying his luncheon; Harold McAlister, who assisted at the sale; J. W. McAlister, Jr., who feels much elated at its success; R. W. Stellar, son of E. A. Stellar, who stands next; owner of the Merci Ranch at Modesto. The next picture shows the stock waiting its turn in the sale ring.

Mr. Penrose, of the firm of Cannon & Penrose of Colorado, breeders of much of the stock at the sale, and Frank Morris, who came from the Sacramento Valley to attend the sale.

Greatest Live Stock Sale on the Pacific Coast

Sixty-six Holsteins Bring $28,150, Making a Record Over All Sales of Live Stock West of the Rockies. Remarkably Fine String of Holsteins Disbursed Will Remain in the State.

HOLSTEINS covered themselves with glory at the Schumacher dispersion sale in Los Angeles Wednesday, May 12. The herd, including some calves of two or three months, brought an average of $415. The top-notcher was Alba Sadie Cornucopia Creetia, purchased by Mrs. Anita Baldwin for $1500. For California this price was a long one, though as Holsteins go in the East the blood she possesses fully justifies the price. Mrs. Baldwin purchased many others, amongst them Dora Abbekerk Johanna, commanding $1075, also Day Beauty De Kol of Windsor, $750. The Whittier State School, of which Mr. Taylor is the farmer, purchased Gertrude De Kol 2d and Leeuwarder Day, paying $1250 for the two. Mr. Geo. Ennis of Riverside purchased one of the top-notchers, White House Belle, for $975.

Mr. J. W. McAlister, Jr., may well feel gratified at his success in handling this sale. Mr. McAlister is one of the younger dairymen of California, who has taken pride in building up a manificent herd on the McAlister Ranch near Chino. His success has been such that he has been made secretary of the California Holstein-Friesian Association. He has worked hard in making known the merits of this stock which was purchased by Mr. Schumacher from Penrose & Cannon, Colorado.

Mr. Rhoades has long been known as one of the best auctioneers of the West, and the success of this sale establishes his position as the equal of any in the country, for in average returns this sale ranks the fourth highest of any ever held in the United States.

The day was a perfect one, and Ascot Park because of its seclusion is an ideal place for the holding of such sale. Many of California's best live stock breeders were present. The best comment which can be made upon it is the list of animals and the prices secured.

Sales List

The following list gives animals purchased, with buyers and prices paid:

Alba Sadie Cornucopia Creetia, $1,500; Cornucopia Karen, $900; Mrs. A. M. Baldwin.

Cornucopia Karen, 2nd, $550, Whittier State School.

King Kasteleintje Segis (bull), $655, Xelis Gephart.

Geertrude Windsor Johanna, $320, A. Ramish.

Geertrude De Kol, $600, L. B. Van Blaricon.

Geertrude De Kol, 2nd, $700, Whittier State School.

Georgie View Union, $385, Bixby Land Co.

Georgie Pontiac, $540, Van Blaricon.

Georgie Gerben Sarcastic, $325, O. M. Polin.

Lincoln Neko De Kol, $445, A. Romish.

Leewarder Day, $550, Whittier State School.

Day Beauty De Kol of Windsor, $750, Mrs. A. M. Baldwin.

Daphne Aaggie De Kol, $355, A. Ramish.

White Gougher Leda, $320, Bixby.

White Aaggie of Windsor, $475, Whittier State School.

Merci King Pontiac Artis (Bull), $410, J. Y. Oldham.

Sir Beets Pontiac (Bull), $305, L. B. Van Blaricon.

Queen Karen of Windsor, $340, Satterberg.

Nemea De Kol Pontiac, $260, S. E. Lawrence.

Gerben Sarcastic, $250, L. Denni.

Nemea Aaggie of Windsor, $485; Windsor Karen Pontiac, $375, C. W. Johnson.

Parthenea Korndyke De Kol (Bull), $650, Chas. M. Schultz.

Prince Hengerveld De Kol Burke (Bull), $255, J. W. Hagerman.

Bertha Chloie De Kol, $350, C. Escallier.

Bertha Johanna, $390, C. W. Johnson.

Windsor Chloie Aaggie, $515, L. B. Van Blaricon.

Ada Pontiac, $450, Allison Peck.

Ada Wayne De Kol, $360, A. Ramish.

Ada Wayne Sarcastic, $310, Bixby.

Jennie Karen Sarcastic, $320, A. Satterberg.

King Gewina Beets (Bull), $225, C. B. Billows.

Stem Winder Karen, $500, S. E. Lawrence.

Union Karen, $415, L. B. Van Blaricon.

Union Karen Segis, $340, C. W. Johnson.

Lady Pontiac Segis of Windsor, $450, C. Escallier.

Dora Karen of Windsor, $350, C. L. Powell.

Dora De Kol of Windsor, $495, C. W. Johnson.

Dora Abbekerk Johanna, $1,075, Mrs. A. M. Baldwin.

Abbekerk Dora Karen, $500, A. Ramish.

Dora Karen Pontiac, $250, C. W. Johnson.

White House Belle, $975, Geo. H. Ennis.

Launa Karen, $360, Bixby.

Windsor Maid De Kol, 2nd, $525, Mrs. A. M. Baldwin.

Windsor Milk Maid Karen, $585, L. B. Van Blaricon.

Windsor Milk Maid Segis, $405, Whittier State School.

Bernice Ormsby of Windsor, $600, Mrs. A. M. Baldwin.

Martha De Kol Johanna, $290, O. Polin.

Bull Calf of Abbekerk Dora Karen, $125, B. S. Cummings.

Heifer Calf of Day Beauty De Kol of Windsor, $250, Bixby.

Bull Calf of Lincoln Neko De Kol, $85, R. A. Todd; Bull Calf of Leewarder Day, $110, R. A. Todd.

Heifer Calf of Ada Pontiac, $210, Bixby.

Bull Calf of Alba Sadie Cornucopia Creetia, $305, F. Anderson.

Heifer Calf of Cornucopia Karen, $290, A. H. Smith.

Bull Calf of Windsor of Milk Maid Karen, $160, A. H. Smith.

Bull Calf of Geertrude De Kol, 2nd, $145, W. F. Kobabe.

Heifer Calf of Georgie Pontiac, $240, A. Satterberg.

Heifer Calf of Nemea De Kol of Windsor, $275, Bixby Land Co.

Heifer Calf of Geertrude Windsor Johanna, $135, Bixby Land Co.

Miss Johanna Pontiac, $325, S. E. Lawrence.

Heifer Calf of White Gougher Leda, $150, A. H. Smith.

Bull Calf of Union Karen, $75, R. Bourland.

Heifer Calf of Bertha Chloie De Kol, $250, L. Denni.

Bull average, $492.50.

Bull calves average, $170.50.

Heifer calves average, $225.

Heifer average, $406.

Cows average, $531.50.

The Pistachio Nut in California

Written for California Cultivator by J. Eliot Coit

THE pistache was introduced into California many years ago and specimens may now be found growing in many parts of the state. So little attention has been paid to this interesting and valuable plant that the product in California has not assumed commercial proportions, yet the pistache is adapted to a much wider area in the arid Southwest than the date palm which has received such a large amount of scientific study.

Pistachio nuts are consumed in this country in considerable quantities. They retail in Pacific Coast cities at from 75 cents to $1.25 per pound. All the supply is imported from Sicily, Greece and Turkey. In the reports of the United States department of commerce pistachio nuts are not segregated, but are grouped with "other nuts," and it is therefore impossible to give the exact amount imported into this country.

The genus Pistacia embraces about a dozen species, most of which are native to the region around the eastern end of the Mediterranean Sea. Some are found as far east as Afghanistan, while one species is found in the Canary Islands and one in Mexico. The genus belong in the family Anacardiaceae and is kin to the mango on one side and to the sumacs and poison ivy on the other. The species which bears the nuts of commerce is Pistacia vera. This is a scraggy, weak-growing shrub which is practically always grafted on species of greater stature and vigor, such as P. terebinthus, which produces the Chio turpentine used in medicine and a kind of gall on the leaves is used as a dyestuff.

Pistacia lentiscus is another species common in Turkey which produces a gum or resin known as mastic, used for chewing gum by Turkish women. Pistacia chinensis is a very large-growing tree recently introduced from China into the United States. It is very hardy and may possibly make a good stock upon which to graft P. vera. A species from the Sahara Desert, P. Atlantica, is also used for root-stocks.

Citrus and Tropical Fruits

UNFERMENTED POMELO JUICE

Written for California Cultivator
By W. V. Cruess

AN unknown but considerable amount of freshly expressed pomelo, grapefruit, juice is served on the breakfast tables of restaurants, cafes and hotels. If this juice could be made cheaply from culls and put up in attractive form, there would doubtless be a demand for at least part of the possible output. The juice also makes, when sweetened to taste, an agreeable beverage for home use; hence the housewife should be interested in putting it up. Therefore a few hints for its commercial and home production should be of interest.

From experiments recently carried out in the zymology laboratory of the University of California it was shown that pomelo juice, unlike orange or lemon juice, retains its flavor after sterilizing. It is this property of the juice that makes it possible to preserve it satisfactorily.

Extraction of Juice

The oil from the skins is not desirable in the juice; therefore the juice from the pulp only should be used. For extracting the juice commercially from citrus fruits a machine has been devised. This machine removes the pulp and juice from the halved fruit without extracting juice or oil from the skins. The juice can then be pressed from the pulp in an ordinary cider press. The machine requires considerable hand labor, but seems the most practical device so far used.

In extracting the juice for home use the fruit may be cut in half and the juice removed on a large glass orange juice cone. These cones are larger than lemon cones but of the same design. Any department store can supply them for about 35 cents.

Clearing the Juice

Pomelo juice has the best flavor if not clarified in any way. However should it seem desirable to clarify the juice it may be done by use of about 12 pounds of Spanish clay per 100 gallons, heating the juice to 145 degrees Fahrenheit, drawing off of clear juice after 24 hours' settling, and filtration of the sediment. This method has cleared the juice perfectly in our laboratory tests. The clay may be obtained from any winery supply firm or any large drug and chemical supply company for about six cents per pound. It is prepared for use by mixing with juice or water and grinding and agitating in the liquid until a homogeneous, finely divided, thin mud is obtained. About ten pounds of the clay to each gallon of water or juice is the right ratio in which to mix the stock solution of clay for use. Then this thin mud is used to clarify the larger lot of juice. The juice should be heated only in aluminum, glass or tin, and 145 degrees Fahrenheit should not be exceeded. Any of the commercially used wine filters could no doubt be used to filter such juice; a small Seitz filter has been used successfully in the laboratory.

Where the juice is bottled cloudy the coarse particles of pulp should be removed by straining through a coarse cloth.

Bottling, Corking and Capping

Grape juice, beer or wine bottles may be used. Those closed with patent caps are most convenient and attractive. Probably bottles of half pint size would be most popular because of the small size drink ordinarily taken. Bottles should be thoroughly cleansed to reduce the number of mold spores. They may be filled about one-half to one inch below the cap. The caps or corks should be dipped in boiling hot paraffin to sterilize them. (Use care with boiling paraffin; it is inflammable.) While still very hot apply them to bottle. The caps and corks carry heat resistant spores that might otherwise spoil the juice.

For home use and small scale production small hand-power capping machines are available for ten dollars or less. However, plain wine bottles may be used and corked with ordinary medicine bottle corks dipped in boiling paraffin and the corks tied down with a string to hold them in during sterilizing.

Sterilizing

The contents of the bottles should be heated to 145 to 155 degrees Fahrenheit, but no higher or lower. If higher than this the flavor is injured; if much lower, spoilage may result. A convenient pasteurizer may be made of a wooden trough about 18 inches deep, fitted with a false bottom. The bottles are placed on their sides (so hot juice will sterilize corks); the trough filled with cold water to cover bottles; steam turned on and the water heated until the juice in the bottles reads 145 to 155 degrees Fahrenheit. The bottles are then taken out and the juice allowed to cool. This pasteurizer is now used successfully for cider, grape juice and vinegar on a commercial scale.

A home pasteurizer for fruit juices is very easily made by putting a quarter-inch mesh heavy metal screen in the bottom of a wash boiler. This protects the bottles from the direct heat of the fire. A thermometer can be fitted through a cork to fit one of the bottles of each lot of juice so pasteurized.

The juice can be preserved by heating to boiling and pouring into ordinary fruit jars and sealing; but boiling of the juice is very objectionable because of the injury to its delicate flavor. Hence this method is not recommended.

Use of Sugar

Various amounts of sugar were added before pasteurization. Amounts of 20 to 50 per cent and over spoiled the flavor, but 10 per cent added before pasteurization seemed to aid in retaining the flavor. This would be about 12 ounces per gallon.

Summary

Very palatable pomelo juice retaining most of the fresh aromatic flavor of the fruit has been made in the laboratory by: Pressing out the juice from pulp only; straining out the coarse particles of pulp; bottling; sealing bottles with corks or caps sterilized in boiling paraffin and pasteurizing bottled juice at 145-155 degrees Fahrenheit. It is not recommended that the juice be clarified. Ten per cent or 12 ounces per gallon of sugar added to the juice before sterilization greatly improves the flavor.

CALIFORNIA AHUACATE GROWERS' ASSOCIATION

Shall we call it alligator pear, avocado or ahuacate? The Cultivator has maintained that with avocado fairly well established it was better to stick to that than to endeavor to change to ahuacate, but growers of this delicious fruit in convention assembled last Friday discussed the pros and cons and decided that the original name is to be preferred. It was said that the word avocado, which means advocate, was adopted as the name of the fruit because of a misunderstanding of the name as pronounced by the natives of Mexico. The word ahuacate is easier of pronunciation but it remains a question as to whether people will take kindly to it. It is pronounced a-wa-ka-ta, with the accent on the third syllable. The last a has the sound of a in ale, the others the sound of a in arm. In any case let us discontinue the use of alligator pear.

The convention was called for the purpose of organizing a State Ahuacate Growers' Association. The attendance was surprising. Every chair in the assembly hall of the Alexandria Hotel in Los Angeles was filled and others were necessary to accommodate the attendants. Many addresses were made calling attention to the de-

sirability, healthfulness and nutritive value of the fruit, and it was deemed wise that growers should organize, not only to encourage best marketing methods and discourage extravagantly long prices for the fruit but to advertise and make known its good qualities.

A committee consisting of F. O. Popenoe, E. G. Hart and C. B. Messenger was appointed to nominate officers for the association. The committee deemed it wise to recommend only a board of nine directors which should meet and elect its own president, secretary and treasurer. Those recommended and elected for the board of directors are C. P. Taft, W. A. Spinks, D. W. Coolidge, Judge Charles Silent, J Eliot Coit, Joseph Sexton, W L Rideout, Edwin G. Hart and F. O. Popenoe. This board will meet and organize within a short time and it is presumed that a series of meetings or conventions will be held, for the interest shown by those attending was very great

The meeting was called to order by Mr. Killick, who made a statement of the needs of such an organization. A temporary organization was effected by the election of D. W. Coolidge, temporary chairman, and Mr. Killick, temporary secretary. It was recommended that the temporary chairman be empowered to call the board of directors together and that Mr. Killick be made secretary pending organization of the board.

It was decided that a membership fee of five dollars should be fixed and on circulation of the roll for membership 38 growers signed up. The first meeting of the board of directors has been called by Chairman Coolidge to meet at Mr. Hart's office, Room 917 Union Oil Building, Los Angeles, on May 29 at 11 a. m.

DRAINAGE OF IRRIGATED LAND

The United States department of agriculture has just issued Bulletin 190, Drainage of Irrigated Land, by R. A. Hart. Anyone confronted with irrigation problems will find this a most valuable bulletin.

EASY

"Can you imagine," demanded the returned explorer, "the enormous extent of the vast snowfields in Alaska?"

"I can," declared the legislator from Wayback. "I had the same sensation the first time I appeared in public wearing a dress shirt."

SHALL THE FARMER'S HOME BE IN THE TOWN OR AT THE FARM?

By Levi Chubbuck, Bureau of Farm Management, United States Department of Agriculture

PACIFIC Coast agriculture differs quite markedly in methods from that of the Middle West and Atlantic coast. As an instance, the farmers in the Atlantic states and the Mississippi Valley, as a very general rule, live on and operate their farms. If the farmer is not the owner and operator he is the renter and operator, and his home is on the farm.

On the stock ranches of the intermountain states, the wheat ranches of Washington and Oregon, and the fruit and alfalfa farms of California, in a considerable proportion of instances, the owner and operator does not live on the place, but in town— possibly in another state. This is particularly the case in the citrus industry of California, so much so that "absentee ownership" of citrus groves seems to be the rule rather than the exception.

It seems to me that this must be a serious handicap to the citrus industry, and that its future prosperity is dependent in no small measure on the location of homes at the groves in which the owners and their families will live.

On the great cattle ranches in the sparsely settled districts of the range country and on the 500 and 1,000- acre wheat ranches, homes would be so widely separated as to make home life for the women and children quite undesirable, but with the 5, 10 and 20-acre units which prevail in the citrus belt of California, and present-day means of communication and transportation, it would seem that the social needs of the citrus grove homes would be amply met.

Unquestionably if the one whose income is dependent on the net returns from the grove made his home there, to do the work called for in the manner and at the time required, it would make for increased efficiency.

This is the phase of farming that especially interests the office of farm management of the United States department of agriculture. Our work is to investigate methods of farm management for the purpose of discovering ways and means of increasing the efficiency of the system of farming in vogue in a community and on individual farms to the end of reducing cost of production and increasing net returns to the operator. If it appears that the farmer's cost of production is nearly equal to, possibly greater than, his returns, leaving little or nothing for his labor, we ask why it is so, and try to determine if the cause is wrong management on his part, and in what particulars.

In my investigation of the citrus industry, it has seemed to me that groves owned by people who live in town, near or remote, possibly in distant states, and have their groves cared for by hired labor, by contract or by the day or month, do not give best results in low production cost and large yields.

The old English proverb, "The ox fattens best under the eye of the master," will apply to citrus trees or any other farm crop. There may or may not be an intelligent sympathy between the tree, plant or animal and one who is interested in having them do well, but it is a fact that the personal attention of the master gets better results than does the indifferent care of a wage-earner.

In conversation recently with a citrus grower, he told me of a neighbor of his who had uniformly grown good crops of oranges. His methods of cultivation, irrigation, fertilization, pruning, etc., were practically the same as those of his neighbors. My friend said to him, "How is it that you are so much more successful with your grove than are your neighbors?"

His reply was that all he did that was different from what his neighbors did was to potter around among his trees and give them individual attention as they seemed to need.

But there is another important economic result coming from the owner and his family making their home at the grove, and that is the considerable portion of the living expenses of the family that will come from the premises without the pay-

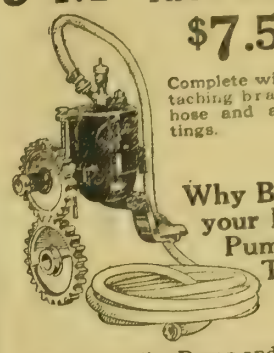
J-M Engine-Driven Tire Pump

$7.50



Complete with attaching bracket, hose and all fittings.

Why Break your Back Pumping Tires?

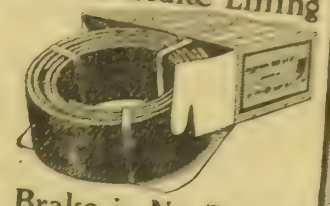
Get a J-M Tire Pump and let the engine do it easier and better than you can with a hand pump and in a fraction of the time.

The J-M Tire Pump inflates up to the proper pressure, and then blows off automatically

Driven by the engine. Construction such that oil cannot be forced into tires. High grade materials used throughout. Car owner can make installation himself.

Now ready for Ford, Overland, Buick, Reo, Chevrolet, Dodge, Studebaker, Hudson, and Hupp 32. If your dealer cannot supply you, write us direct. Send for booklet.

J-M Non-Burn Brake Lining



A Brake is No Better than its Lining

If the lining is not efficient the brake mechanism can't be.

Don't court disaster with an inferior brake lining.

Use J-M Non-Burn — you can depend upon it absolutely. It grips firmly. It holds fast. It's your best friend when an accident threatens.

Made of imperishable materials, the best long-fibre Canadian Asbestos. Will not burn because it can not burn. A real economy as well as a real safeguard. If your dealer can not supply you, write us direct. Send for booklet.

Deciduous Fruits

THE TENT CATERPILLAR

THE conspicuous, unsightly nests or tents of the apple tree tent caterpillar are familiar objects in the spring in trees along roadways, streams and fences, in neglected orchards and elsewhere. Several methods of checking the depredations of this caterpillar are given in a new publication of the department of agriculture, Farmers' Bulletin No. 662.

These gregarious caterpillars construct the tents for their protection, and these, at first small, are gradually enlarged often to a foot or more in height and diameter, the size varying with the number of individuals in the colony. The caterpillars feed upon the foliage of the trees, stripping the leaves from the limbs adjacent to the nest, and if there be several colonies in a tree, as is frequently the case during periods of abundance, the foliage may be quite destroyed, leaving the branches as bare as in midwinter.

Species of the tent caterpillar are found quite generally over the entire United States. The moths deposit their eggs by early midsummer or earlier in the South. By fall the embryonic larva is practically full grown within the egg where it remains until the following spring. With the coming of a warm spell the larvae escape by gnawing through their egg-shells, often before there is foliage out for food, and under these circumstances they may feed upon the glutinous covering of the egg mass.

Methods of Control

The tent caterpillar feeds principally on wild cherry and apple trees, but will attack many other plants, and where such trees can be removed without disadvantage this should be done, thus lessening its food supply.

During the dormant period of trees, when the leaves are off, the egg masses are fairly conspicuous, and with a little practice may be readily found; it is then that they should be cut off and burned. Trees infested with larvae during the early part of the year, or those in the immediate vicinity, are perhaps more likely to be chosen by the parent moth for the deposition of her eggs, and such trees at least should be searched if it is not practicable to extend the work to the orchard as a whole. This work may be combined with pruning to good advantage, and a lookout should be kept not only for the eggs of this insect but for the eggs and cocoons of other injurious species which pass the winter on the trees.

When two egg masses are deposited close together, the resulting caterpillars may form a common nest. These nests are gradually enlarged and soon furnish ample protection. If the caterpillars are destroyed as soon as the small nests are detected this will prevent further defoliation of the trees, and the rule should be adopted to destroy them promptly as soon as discovered. In this work either of two practices may be adopted, namely, destruction by hand or with a torch.

When in convenient reach the nests may be torn out with a brush, with gloved hand, or otherwise, and the larvae crushed on the ground, care being taken to destroy any caterpillars which may have remained on the tree.

The use of a torch to burn out the nests will often be found convenient, especially when these occur in the higher parts of trees. An asbestos torch will be satisfactory, or one may be made simply by tying rags to the end of a pole. The asbestos or rags are saturated with kerosene and lighted and the caterpillars as far as possible cremated. Some caterpillars, however, are likely to escape, falling from the nests upon the application of the torch. In using the torch great care is necessary that no important injury be done the tree; it should not be used in burning out nests except in the smaller branches and twigs, the killing of which would be of no special importance. Nests in the larger limbs should be destroyed by hand, as the use of the torch may kill the bark, resulting in permanent injury.

Spraying With Arsenicals

Tent caterpillars are readily destroyed by arsenicals sprayed on the foliage of trees infested by them. Any of the arsenical insecticides may be used, as Paris green, Scheele's green, arsenate of lead, etc. The first two are used at the rate of one-half pound to 50 gallons of water. Milk of lime from two to three pounds of stone lime should be added to neutralize any caustic effect of the arsenical on the foliage. Arsenate of lead is used at the rate of two pounds to each 50 gallons of water.

Even in the small home orchard of a dozen or more trees it will be found highly profitable to adopt a system of spraying which will control not only tent caterpillars but such serious pests as the codling moth, cankerworms, various bud and leaf feeding insects, and which will greatly reduce injury from the curculio.

On stone fruits, such as cherry, peach and plum, arsenicals are likely to cause injury to foliage and must be used with caution if at all. On such trees the arsenate of lead is preferable, as it is less injurious to foliage, and on all trees sticks much better. In spraying for the tent caterpillar only, applications should be made while the caterpillars are yet small, as these succumb more quickly to poisons than those more nearly full grown, and prompt treatment stops further defoliation of the trees.

THE PISTACHIO NUT IN CALIFORNIA

(Continued from Page 579)

Pistachio nuts are really one-seeded drupes like almonds. The outer flesh of the olive-like fruit dries and falls away and the thin shell dehisces, exposing the large kernel. The kernel is covered by a red pellicle somewhat like that of a peanut. The meat of some varieties is green and is on this account especially valued as a coloring agent in ice cream, to which it also adds a distinctive flavor. The shells may be easily opened with the fingers. The flavor is very rich and pleasing, somewhat like that of the pinon of the Rocky mountains. In this country the kernels are made into a paste which is largely used in various ways by confectioners. Pistachio nuts are also eaten out of hand to some extent; in fact, there is no reason why they should not be widely used as a table nut, served like the almond, as soon as they become better known.

The pistacia is typically a desert plant, thriving in dry air and on rocky hillsides and needing comparatively little rain. The trees require plenty of sun and prefer a southern exposure with a well-drained soil. In fact, wet soils are very detrimental to the growth of the trees. Many of the pistaches grown in California which have failed to do well have been too frequently irrigated. The pistache abhors wet feet. The finest and most thrifty pistache trees which the writer has seen in California grew under the thorough summer cultivation of a dry-farm near Fair Oaks in Sacramento County. This would seem to be the best way to handle the crop wherever the winter rainfall is 12 inches or more. Some trees have fruited heavily at Whittier and others at Fresno, showing the possible wide range of climatic adaptation.

The pistache will endure a temperature of 15 degrees Fahrenheit and is fully as hardy as the fig and olive. The trees do not blossom sufficiently early to be in much danger of spring frosts. The trees when grafted on P. terebinthus are long lived, sometimes bearing for a hundred years or more. They come into bearing five or six years after planting in the orchard and should be planted about 20 feet apart.

One peculiar thing about the pistache is its dioecious character, the male and female flowers being borne on separate trees. Male trees must be scattered through the orchard in the proportion of one to eight or ten females. This is another reason for grafting the plants, for not only should the largest fruited females be selected for propagation, but the proper number of males must be included, and it is not easy to tell the sex of the plants before they flower. Some growers in

Turkey bud one branch of the male tree into each female tree, but this requires too much work in subsequent pruning, unless indeed only one tree is desired for home grounds, when this plan will probably be desirable.

When the pistache is budded it is customary to cut the stock back previously so as to force out strong shoots. Dormant buds are placed in these shoots in the fall to be forced into growth by pruning the following spring.

If a female tree comes into blossom before the adjoining male tree, a few branches may be cut from a blooming male tree, brought from a distance and hung up in the female tree with their stems inserted in a bottle of water to keep them fresh.

In Southern Europe where wild pistaches are indigenous to the dry hillsides, the wild plants are often topworked to improved varieties where they stand. It is a simple matter to leave a few male trees here and there for pollenization purposes. It thus comes about that the nuts of commerce will, if planted, usually produce hybrid plants which are so variable as to render them undesirable as stocks. For the same reason good fruit should not be expected from seedlings unless it be known that the seeds are pure P. vera unaffected by pollen of wild species.

The fruit must not be harvested before it is perfectly ripe. The best time for gathering it is when the wrinkled skin is assuming a darker yellow color and the clusters are changing color and drying up. The pistachios separated from the clusters are then placed in the shade on trays to dry, being turned occasionally. When they have sufficiently dried so as not to ferment they may be stored in a dry place beyond the reach of mice.

The United States department of agriculture has introduced a number of the best varieties from Europe, Asia and Northern Africa, as well as a number of different species for stocks. These are being experimented with by Mr. G. P. Rixford, who has given much attention to the pistache. California nurserymen are now beginning to offer a few grafted trees for sale. It is to be hoped that more interest will be taken in the culture of this worthy nut which was so highly prized by the ancients. The information at present available is not sufficient to warrant the planting of any large commercial orchards. While we do not know how high an average yield may be expected or just what is the best method of cultivation, plant lovers will find the pistache an interesting and promising subject for experimentation. It should be remembered that the trees prefer a hot dry summer climate with moderate winter rains. The less irrigation and the more cultivation, the better.

The writer wishes to make his collected data on fruiting pistaches as complete as possible and will be glad to correspond with anyone who may have a tree in bearing.

FARM BUREAU NOTES

Ventura County

Farm bureau meetings will be held in Ventura County on the following dates. These are changes from the meetings announced in the Cultivator of May 13:

Santa Paula, May 21.
Moorpark, May 24.
Mound, May 25.
Simi, May 26.
Annual Farm Bureau meeting.

The annual meeting of the Ventura County Farm Bureau will be held in Foster Park Saturday, May 29th, at 12 noon. The farming population of the county will participate in a basket picnic to be held under the trees in Ventura County's most beautiful park. The following program will come immediately after luncheon:

Rural Credits, by Thomas Forsyth Hunt, Dean of the College of Agriculture, University of California.

Farm Bureaus in Other Counties, by Prof. B. H. Crocheron, State Leader in the Farm Adviser work.

Progress and Result of the Ventura County Farm Bureau, by A. C. Hardison, Director-at-large.

The Women's Part in the Farm Bureau Movement, by Miss Lillian Clark, of the Department of Agricul-

Put Hercules To Work On Your Farm.

NOT the Hercules of mythology, but the modern Hercules—Hercules Dynamite.

Hercules Dynamite does the work of a dozen men; does in minutes what would take them hours, and does it at a fraction of the cost.

By means of subsoiling Hercules Dynamite releases great quantities of virgin plant food and restores fertility to worn-out soil.

Trees that are planted by its aid are more healthy and vigorous than trees planted in spade-dug holes, and they bear earlier.

Hercules Dynamite rids the land of stumps and boulders.

It helps to drain marshy land and it digs ditches, cellars, cisterns, etc.

HERCULES DYNAMITE

does all these things more quickly than they have ever been done before, more easily, more economically, and more efficiently.

Just *how* Hercules Dynamite does this work is told in a plain understandable way in our

Small Fruits Vegetables

GARLIC

Written for the California Cultivator
By D. F. Reichard

GARLIC is one of the onion family and is grown under very much the same culture as onions. It is grown from cloves or bulblets obtained by breaking up the mature bulb.

The soil best adapted for garlic growing is light loam, naturally moist or in which moisture may be retained by cultivation or one for which irrigation is available; but soil of a heavier nature may be used so long as it is kept in a friable condition for the development of the bulbs.

In preparing the soil for garlic it should be deeply plowed and well pulverized. On soil that is naturally moist enough to mature a crop, planting on the level six inches apart in rows one to two feet apart is more satisfactory, but where irrigation is necessary, plant on ridges a foot wide and three feet apart, setting two rows of the bulblets on each ridge. The sets should be covered nearly an inch and well firmed in to prevent the new roots from pushing them out of the ground as growth begins.

Planting may be made any time from October to the first of May, but January and February are the best months. Cultivate with as fine toothed a cultivator as practical. Thorough hoeing after the first two cultivations will eliminate practically all the weeds. If irrigation is required it is usually necessary to make three and some years four applications of water at intervals of ten days to insure steady growth. After each irrigation as soon as the ground is dried out enough, which takes from two to four days according to the nature of the soil, the patch should be cultivated, using an eight or ten-inch furrower on the rear of the cultivator, thereby leaving the ground in shape for the next irrigation. By the time of the last cultivation bulbs should be forming and then it is necessary to let the plants dry down. When the tops begin to turn yellow and bend over it is time to begin the harvest. Put the whole plant, as pulled in the field, into trays, and store in dry place, unless the market is good, in which case cut the tops off an inch or so from the bulb and pack for market as convenient. If stored after drying down cut the tops off an inch from the bulb.

It requires 250 to 300 pounds of bulbs to set an acre and the product is about one and a half tons.

CHAMPION TOMATO RAISER TELLS HER STORY

MISS ELOISE PARSONS of Clarinda, Iowa, is the young woman whose record in the department of agriculture's garden and canning clubs was the best of the thousands made by members in the 33 northern states. Miss Parsons obtained a yield of 5318 pounds of tomatoes from her tenth-acre plat. Her costs were $15.61, and her net profits were $115.57. Her costs cover every item of expense in raising the crop, including rent of land, her own time (estimated at 10 cents an hour) fertilizers and sprays. She describes some of her difficulties in obtaining this result as follows:

"I decided I would try and have ripe tomatoes very early and so obtain good prices for them. So in the latter part of February I planted the early variety in three boxes which I placed on a shelf in front of the south windows in the dining room. In a short time they came through and grew rapidly. But they began to grow tall and spindly, so in the latter part of March I transplanted part of them into small pasteboard boxes, one plant in each. By doing this I could move them to the open without disturbing the roots and hindering the development of the plants. Then as soon as it was warm enough I set the rest in a cold frame, four inches apart each way. In the first of April I planted the late variety in the hot bed. Those in the cold frame and in the pasteboard boxes developed a great amount of roots and were very strong, some in bloom, when I transplanted them to the open on the 22nd of May. The plants in the hot bed did not develop such strong roots, and because of this fact, and also that it was very dry, I lost quite a few of them when I transplanted them. After filling in for the fourth time a few vacant places still remained, as it was almost impossible to get them started because of the early drought. In all I had over 600 plants."

"I hoed them after each rain and whenever I thought it necessary. As we moved to this place this spring, and the garden was not plowed in the fall, many weed seeds were not destroyed, and I had a very hard time keeping the weeds down. The plants did not grow very large, and as it continued very dry, I decided it not best to stake the plants. The plants did not make a very great growth and very few needed pruning. I hoed them until the tomatoes began to ripen and the plants were too large."

"I picked my first ripe tomatoes on the ninth of July. From then on the pickings every two or three days grew larger. At first I received ten cents a pound, but soon the price began to fall so that after the first of September I received only two cents a pound. As my father runs a dairy, he took the tomatoes with him and sold them very easily to the hotels, restaurants, and milk customers. He was able to sell almost all of them until the green ones were gathered. As long as we could get a dollar a bushel for the tomatoes fresh and as we were so very busy with the work of a dairy, I thought it best not to can them."

"After school began I was kept very busy in picking the tomatoes. For several weeks it took me three evenings of the week to get over the entire patch and I often gathered over ten bushels. During the second and third weeks of September we had so much rainy weather that I could not gather the tomatoes, and after the rains they began to ripen so rapidly that many of them split. On the 12th and 13th of October I had to gather the green tomatoes. I gathered 1083 pounds. There was no sale for these. We used all we could and I gave some to the neighbors, and still a great many went to waste, as they were wet when they were gathered, and as it turned warm again, they rotted very fast. As we had a great deal of company this summer, and because our other garden vegetables were not as good as usual, we used more tomatoes fresh."

"I made a collection of canned fruits, vegetables, and meats, which consisted of the following: Tomatoes, beets, white wax beans, green podded beans, celery, carrots, pickled onions, beet greens, pumpkin, shelled beans, pears, apples, plums, peaches, cherries, strawberries, raspberries, white and purple grapes, sausage, chicken, corn, watermelon pickles, and gooseberries. I exhibited this collection at the state fair and won a first, a second, and a fourth on it and my other club work. I did all this canning by the cold packed, hot-water bath process. I also canned, alone, 30 quarts of windfall apples, ten quarts of gooseberries, six pints of beans, 100 quarts of tomatoes. I also helped with the canning of the strawberries, cherries, peaches, tomato butter and catsup, apple jellies and gooseberry jam."

"As a summary I will state that my expenses were $15.61 and my profit $115.57, besides winning $23 in prizes at the state fair. I have enjoyed this work, although it has been long and sometimes a bit lonesome. It has been a way by which I could not only have my own spending money and pay my expenses at the Farm Camp, but I also have a bank account of $60."

ENGINE POWER COSTS LESS NOW

MY BOOK TELLS WHY

Lower Engine Prices:
2 H-P $34.95; 3 H-P $52.50; 4 H-P $69.75; 6 H-P $97.75; 8 H-P $139.85; 12 H-P $197.00; 16 H-P $308.80; 22 H-P $389.65.
Portable Engines Proportionally Low.

WITTE Engines

Gasoline, Kerosene and Gas.

Besides lower price, WITTE engines use **less fuel** per horse-power hour—from one-fourth to one-third less—enough saving in a year to pay entire cost of engine. **Easy starting;** no cranking. Investigate these points before buying any engine.

Buy Direct; Cash or Easy Terms.

New Book Free Write me, so I can send you by return mail, full information on how to get lower power cost, **after** you get your engine, as well as low price **before you buy.**

AN INVITATION

ON this page we have endeavored to bring to the attention of our subscribers certain things which should be of special interest to them. By using this page as a guide you will be sure not to miss the displays here listed. Other weeks will be added items touching upon exhibits of particular interest, and of course each special feature on the program will be mentioned in sufficient time to keep our readers in touch with all events of agricultural interest.

Vice President Thomas R. Marshall, after visiting the Panama-Pacific, said:

"If there be any one in America with a thirst for knowledge and for beauty and a longing for a liberal education such an one can here obtain it. This is the university of the world. It has a chair fully endowed to meet the wants and needs of each. The eye, the ear, the mind, the heart, the soul, each may have its horizon here enlarged."

P. P. I. E. PROGRAM

Events at P. P. I. E. for the next two weeks are:

May 20, North Carolina day; National Congress of Mothers; Redlands day.

May 21, Reno day.

May 22, California Federation of Women's Clubs.

May 24, Empire day; New Jersey day; Eureka day; Redding day.

May 26, Red Bluff day.

May 27, Chico day.

May 28, Marysville day.

May 29, Wisconsin day; Napa day; Sacramento day.

May 30, Decoration day.

June 1, Ukiah day; Kalamazoo, Michigan, day.

June 2, Santa Rosa day.

June 3, Alameda day; Royal Neighbors' day.

June 4, American Sweet Pea Society day; Berkeley day; Peace day.

June 5, Denmark day; Oakland day.

June 5-9, world's light harness races.

COMING CONGRESSES

These are to be held in or near San Francisco.

Cereal Conference, under direction of University of California and United States department of agriculture.

Merced, May 24.

University of California, May 25.

Davis, May 26.

Chico, May 27.

Prof. John W. Gilmore, University of California, Berkeley; Prof. M. A. Carlton, United States department of agriculture, Washington, D. C.

California County Librarians, Berkeley, June 3-9.

J. L. Gillis, president, Sacramento; Alice J. Haines, secretary, State Library, Sacramento.

American Sweet Pea Society, San Francisco, June 4.

Lester L. Morse, president, 48 Jackson Street, San Francisco; Harry Bunyard secretary, 342 West Fourteenth street, New York.

EXPOSITION PICTURE

The illustration at the head of this page in the issue of May 6 is from a copyrighted picture taken by Mr. Edward H. Mitchell, 3363 Army Street, San Francisco. Any one desiring a large picture in colors may secure it by remitting ten cents, coin or stamps, to Mr. Mitchell.

The eggs which the little Buff Leghorn hen Betty produced in one day have been prepared for exhibition and will be shown in the pen in which she has her home. The bantam hen with her brood of chicks is located in the main corridor of the poultry building within the yard inclosure which holds the cage of a Japanese long-tailed rooster, whose tail now measurers more than eleven feet.

An interesting exhibit in the department of live stock are the silkies sent by Japan. These birds are pure white in color, with black faces and combs. They are small and their great peculiarity lies in the fact that their feathers have no quills.

The Percheron Society of France has made an offer of six very valuable objects of art to be awarded in its name to the Percheron horses placed on exhibition in the live stock department this fall.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

General Agriculture

SOIL SURVEY OF SACRAMENTO VALLEY

WITH the aid of irrigation, the subdivision of large holdings, and an increase in the number of farmers the Sacramento Valley promises to develop rapidly, according to a reconnoissance soil survey of the region, which has just been published by the United States department of agriculture in a report of 148 pages, with a map and seven illustrations. The possibilities of the valley, says the report, have not been even approximately developed, and by far the greater acreage is devoted to grain growing at a small profit, although an important though smaller acreage produces a wide diversity of fruits and other specialized crops. The tendency is towards dairying and an increased production of fruits and truck crops.

The region included in the survey covers an area of 6274 square miles, including the main valley floor, the valley slopes, and portions of the lower rolling or foothill areas joining the Sierra Nevada and Coast Range mountains. With the San Joaquin Valley, the Sacramento Valley constitutes the most extensive agricultural section in California. The region is semiarid, the annual rainfall varying from 14 inches in the southern part to about 25 inches in the northern. The mean annual temperature is from 60 degrees Fahrenheit to 62.5 degrees. The low humidity makes the high summer temperatures less oppressive. Killing frosts are ordinarily confined to the winter months, different parts of the valley varying greatly in the danger from this source.

In the agriculture of the valley irrigation is an important factor. It has long been practiced in this region, but its development up to the present has not been rapid. The total supply of water is great, but it can only be made available for all parts of the valley by large expenditures of money. It is, however, generally recognized that irrigation is highly desirable, and in many parts of the valley it is the controlling factor for all crops except grain.

An equally pressing problem is the control of flood waters. A great deal of money has already been spent in the construction and maintenance of levees, and a fairly efficient system now protects much of the valley. Comprehensive plans are also being worked out for additional improvements, and systems have been installed to relieve certain soils of sluggish internal drainage. There is no doubt that properly placed reservoirs will aid in protecting the main valley from floods and the valley slopes from intermittent overflow.

At the present time large areas, particularly on the west side of the valley, suffer from excessive quantities of alkali, and the reclamation of these will involve a large expense. Important areas of alkali soils are also found in the southeastern portion of the territory covered by the survey. Thorough drainage is declared to be the first requisite for the reclamation of all this alkali land, but no specific plan that will be suitable for all cases can be recommended.

The many different groups of soils occurring in the valley are broadly divided into four province groups or divisions—residual soils from consolidated rocks; soils derived from old valley-filling material; soils derived from alluvial and recent alluvial-fan deposits; and lastly, wind-laid soils. In addition there are five types or groups of a miscellaneous character. The residual soils comprise seven soil series, and are found largely along the valley margins. They are used largely for pasturage, the rolling ground in many cases being unsuited for cultivation. In many areas, however, there are successful orchards.

Ten series are found among the soils derived from old valley-filling material. These occupy positions along the outer valley slopes or rolling areas, and are usually somewhat lower than those of the residual soils. The Redding and San Joaquin series occupy, by far, the largest areas. Redding soils are not well adapted to fruit culture without irrigation, and in consequence a large part of the series is devoted to pasturage. Nearly all the remainder is under grain production. With irrigation, however, the shallower areas produce a wide range of shallow-rooted fruits, berries, and olives, while the deeper-rooted fruits can be profitably grown on the areas of deeper soil. The San Joaquin soils are often locally known as "red hardpan" lands. At less than six feet a red or mottled relatively impervious hardpan is encountered. This limits subsurface drainage with the result that during the rainy season the ground is often boggy, and during dry periods, hard, flinty, compact, and baked when not cultivated. The San Joaquin soils are largely devoted to dry-farmed grain, but under irrigation have proved well adapted to a wide range of fruit crops.

The third province group consists of 16 soil series derived from alluvial and recent alluvial-fan deposits. These soils occupy the lower parts of the valley or the valley slopes, and it is upon them that the greater part of the intensive agricultural development of the region has taken place. Of the Madera and Gridley loams group, for example, it is said that it is safe to predict a rather rapid development until practically all of this group comprising 94,144 acres is devoted to the production of fruit and truck crops. The Yolo clay loams and clays comprising 90,496 acres will also, it is said, eventually be devoted to intensive crops. At the present time grain predominates in point of acreage.

Only one type of wind-laid material—the Oakley sand—was encountered in the valley, and it covered only 2752 acres. Under natural conditions, this type supports a scanty vegetation, being partly used for the production of grains, almonds, grapes, asparagus, and peaches by dry farming.

Of the miscellaneous materials, the Muck and Peat group is the most important, comprising 187,520 acres, much of which is near the confluence of the Sacramento and San Joaquin Rivers, and extending for some distance up their courses. Much of the land is only a few feet above sea level, and consists of a great number of islands of varying sizes. A great deal of reclamation work has been done, but some of the reclaimed areas have been submerged again through the breaking of the levees. Under cultivation and drainage, muck and peat lands settle considerably, so that the maintenance of the levees becomes increasingly difficult. Special crops on these areas are cultivated largely by Asiatics accustomed to furnishing the vast amount of hand labor and skill necessary to success under these conditions. The soil is admirably adapted, however, to many kinds of vegetables and some forage crops. The other miscellaneous materials such as riverwash, tailings, and tidal marsh are of little agricultural importance.

HONOR TO GOODHUE

In our April 1st issue the editorial correspondence on first page referred to the genealogy of exposition architecture at the Panama-California Exposition at San Diego, giving the credit to Mr. Frank P. Allen for both architecture and landscape work, also referring to him as being the architect of the exposition buildings at Seattle. On this point we have a letter from Mr. Russell C. Allen of San Diego, a member of the California State Commission, Panama-California Exposition.

"My attention has been called to your appreciative notice of the Panama-California Exposition at San Diego. You speak of the genealogy of exposition architecture and state that the architectural work was under the direction of Mr. Frank P. Allen. Mr. Allen was not the architect of the exposition but its director of works, a

very different thing. This was the position which he occupied at Seattle also and it was because of the qualities which he developed there that we employed him at San Diego where he has shown marked ability, especially as an executive.

"When it was decided to adopt the Spanish Colonial as the uniform type of architecture for the exposition, the building and grounds committee looked about for a master in that line and found him in Mr. Bertram G. Goodhue of the firm of Cram, Goodhue & Ferguson, of Boston and New York. It was this firm which did the fine buildings at West Point. Mr. Cram is the architect now in charge of the immense cathedral of St. John the Divine in New York City and Mr. Goodhue built the beautiful church of St. Thomas on Fifth Avenue and is now engaged on a cathedral in Baltimore which is to cost over $5,000,000.. Mr. Goodhue is recognized among architects as their foremost exponent in the Spanish Colonial, and when one views the California and Fine Arts permanent group as so well shown in your illustration he hardly wonders that this is so. The plans for this group—which is the architectural glory of the whole exposition—were the personal work of Mr. Goodhue in New York and the buildings were erected by contract independently of the works division.

"The main buildings along the Prado were designed under Mr. Goodhue's direction and control by his accredited representative on the ground, Mr. Carleton M. Winslow, with certain exceptions. The Puente Cabrillo, Commerce and industries, San Joaquin, Sacramento Valley, and various of the smaller buildings were designed by the division of works under Mr. Allen's direction after Mr. Winslow had resigned from the division of works and had assumed the superintendence of construction of the California and Fine Arts group.

"The Southern California Counties Building was sketched by Mr. Goodhue personally during one of his visits here and the plans were then worked out by Mr. Winslow.

"As the architecture at San Diego has called forth much admiration and some confusion seems to exist as to its authorship, it seems well to correct any statement which might give a wrong impression."

Later a letter came from Mr. Allen rendering full credit to Mr. Frank P. Allen for his portion of the work in making this beautiful exposition, as follows:

"In my former letter I spoke only of the architectural work and not of the landscaping. Mr. Allen should have full credit for the latter. His work in that seems to me very remarkable and demonstrates his administrative ability. We originally engaged the Olmsted Brothers, who are probably the leading firm in that line in the country. They resigned before work had actually begun, but even if they had stayed it does not seem possible that their work could have been better than Mr. Allen's."

AMERICAN SYNDICALISM

"American Syndicalism, The I. W. W.," by John Graham Brooks, published by the Macmillans, New York, at $1.50 net.

The preface entire is as follows:

"A considerable part of this volume was given as lectures at the University of California in 1911. For present purposes the material has been recast and wholly rewritten.

"The space given to the more general socialist movement and to the European origins of syndicalism is justified on the ground that our tantalizing I. W. W. are not otherwise to be understood. Beyond socialism these represent the most revolutionary phases of social and economic revolt.

"This combative, frontier character of the movement is so reflected in its literature and among its followers, that almost any statement one may make about syndicalist principles will meet direct denial. Between the higher and more theoretic syndicalists and the practical fighting members in the field of agitation, the differences in the interpretation of principles are radical to the point of confusion. This could not be otherwise in convulsive mass-action like that which characterizes syndicalist strategy."

One is inclined at times to get the opinion that the book supports much that is usually condemned in methods often employed by labor agitators. However, we believe the author is endeavoring to induce his reader to study a perplexing problem from the standpoint of the so-called down-trodden.

There are 19 chapters touching the labor problem as no other publication has attempted to do. To give an idea of the contents, these different chapters touch upon the socialist invasion, more immediate danger, plague of misconceptions, history of disappointment, forerunners of the I. W. W., war of the classes, "direct action," sabotage, constructive suggestion, service of the awakener, and some of our own duties. It is a book which causes one to stop and think.

SOIL CONSERVATION.

"Unto him that hath shall be given; and from him that hath not shall be taken away even that which he hath."

Like many other scriptural expressions the above does not mean exactly what it says. It certainly would not be possible to take something from nothing although it would be possible to give to a person who already had. As applied to soil and soil culture, however, the quotation continually comes to the mind of a person who has worked much with growing things. A lean or worn out soil will not grow much of a crop and those who have had experience know very well that a run down soil is a very difficult thing to build up and put into good condition for fair crops. The leaner and poorer the soil is, the greater the tendency to become still more impoverished, and necessarily, the poorer the crops secured. In other words, "from him that hath not shall be taken away even that which he hath."

On the other hand, with a soil which is in good tilth and well filled with humus and the necessary chemical elements, it is indeed easy to maintain the state of fertility unless unusually exhausting crops are grown. This does not mean, however, that due diligence and care should not be exercised in maintaining the state of fertility, as once on the down hill grade the arresting of the depreciation is difficult. A liberal supply of humus or decaying vegetable matter is the most important factor in the keeping up of soil in condition for securing maximum crop yields. If the soil is well filled with humus the necessary chemical elements may be supplied in the form of commercial fertilizer in proportion to the rapidity with which these elements are removed by the particular crop grown. The maintaining of humus is a very easy matter in soil which is already well supplied. In fact the tendency with some crops is to increase the humus content of the soil rather than diminish it. Soil rich in humus and otherwise in a fertile condition everyone knows will give big crops. In such cases "Unto everyone that hath shall be given."

Poor soil tends to produce smaller crops, and rich and fertile soil, if well handled, tends to produce larger crops. —Madison Cooper.

The Riverside public library is planning for a summer school for the training of young people in the library service. The school will begin June 28 and continue until August 7.

HOW TO ESCAPE FROM A SMALL JOB

Every little while there comes to me a letter from some youngster who tells me that he hears Opportunity calling him to go to New York or some other big city. He has figured that his home town offers him no chances.

Perhaps it doesn't.

Few towns ever offer anything to anyone. That much I've discovered in what little wandering I've done.

It doesn't take one very long to discover that the wise young man is spending mighty little time looking for chances to get, but is, as a westerner would say, "some industrious" in looking for chances to give. And, as those who have tried it know, New York and every other big city is calling for givers.

In the city where every faculty must ever be on the alert only the great giver is the great getter. Many of my friends have tried the pace in the big town and after playing the game for a few months, gone back. Some less wise are still struggling on. A few have succeeded and are steadily climbing ahead.

It is another case of "many are called but few are chosen."

Only the fit survive. The unfit perish.

The wise young man is he who gives until the institution or individual employing him can receive no more.

Until one can swim across the creek, one had better refrain from attempting to swim the river.

The advice of the cowboy, "Shoot from where your gun is," is good ad vice.

Serve where you are.—Character.

"I always find just what I need at the lowest price in WHITING-MEAD'S BUILDING MATERIAL Catalog" You can do the same! Don't Delay Send Coupon Today and receive this Valuable Book FREE

Buy direct - - at rock-bottom prices - - and save 25% to 40% on every order of building material you place. Clip the coupon, fill it out and send it in TODAY. You will receive the big, comprehensive Whiting-Mead complete Building Material catalog by return mail. It is saving money for thousands of ranchers. Why not for you?

26 Guage Corrugated Iron $2.60 Per 100 sq. ft.

A big special purchase that's another proof of our great buying power, as this price is really less than ordinary wholesale cost.

26 guage, 95 lbs. to 100 sq. ft., best annealed sheet steel thoroughly coated with a specially prepared paint and for many uses, even more satisfactory than galvanized.

Place your orders for this early, as even the great quantity that we have secured will not last us for very long, and it will not be possible to get more to sell at this price until after the war.

Regular widths in 7 ft., 8 ft. and 8½ ft. lengths.

Galvanized Screen Wire—14 mesh, per square foot in full rolls, 2¼c; less than full rolls, 2½c.

Galvanized Conductor Pipe—3 in., 6c per foot in 10 ft. lengths; 4 in., 8c per foot in 10 ft. lengths.

Irrigation Pipe—of galvanized steel for surface use, made of 24 guage steel, 10 ft. lengths only; 4 in., per 100 ft., $14.40; 5 in., $18, and 6 in., $21.60.

These prices will give you some idea of the wonderful savings possible through ordering from us by mail. If you have not a copy of our wonderful new 1915 Catalog of Building Materials, use the coupon and send for it NOW. Everything that you need for building, fencing, tools, piping, etc., at "lower prices."

Hay Forks with 4, 15 inch oval steel tines, $1.
Square point, long handle shovels, 75c.
Garden hoes, 6 in. blade, 60c.
Coes' knife handle monkey wrenches, 6 in. size, 50c.
Agricultural monkey wrenches, 6 in. size, 25c.
Expansion bits, ½ to 1½ inches, 75c.
Large steel measure squares, both sides, 35c.
4½ in., try squares, 20c.
Car soldering sets, complete, 40c.
12 oz. claw hammers, 25c

Builders Hardware

Inside door locks, nickel finish, 50c each; dull brass, antique copper, or sand blast, 45c.

Sliding door locks, with one bronze key, finished in dull brass, antique copper or sand blast, single, $1.40; double, $2.10.

Cupboard turns, cast brass, T handle, antique copper, dull brass, sand blast or nickel plated, each 40c.

Drop handle drawer pulls, same finishes as above, 20c each.

Flush sash lift, antique copper or dull brass, 7c; sand blast, 8c each.

Bungalow front door handles with plate and thumb latch but no lock, antique copper, dull brass or sand blast, $3.25, or complete with lock, $7.

Store door lock, very serviceable, cylinder lock, bolts and night latch with three bit keys, any of above finishes $5.75, complete with brass escutcheon.

French window locks, any of above finishes, $1.30 complete, a $1.50 value.

Genuine Yale night latches with three German silver keys, $1.50.

Pressed steel butterfly hinges, 10c pair, all finishes.

Pressed steel screen door hinges, japanned, 12c pair; antique copper or dull brass, 20c pair.

Standard House and Floor Paints, $1.50 per gal.

Standard makes of varnishes at 25% off regular prices.

Black Graphite Roof —per gal., 50c.

Standard Roof Paints— red, green, gray—per gal., 85c.

Shingle Stain, made from pure ground colors—per gal., 50c.

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kalsomine, 4½c per lb.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

DOERS, NOT LOOKERS

An admirer of the Holstein cow defines her as "a mouth, wide open, a big stomach carried strongly on four legs, udder the size of a large pumpkin or a small cock of alfalfa hay. She is made up of 25 per cent appetite, 25 per cent good digestion, 25 per cent milk and the other 25 per cent is variously distributed." In other words, what the dairyman, and the world in general, demands today is an animal with capacity for large consumption and large production.

WHEAT CROP

Estimates are that this year's wheat crop of the United States will greaty exceed that of 1914. There are over 40,000,000 acres to be harvested. Its condition is 92.9 per cent as compared with 87.4 per cent, the ten-year average. Of this acreage California has 440,000, which shows that as a wheat producing state we are rather low in the scale. There are an even dozen states which produce in excess of a million acres. Kansas is a long leader with an acreage of 8,472,000. From California's 440,000 acres it is expected there will be harvested 8,300,000 bushels of grain. Kansas will harvest—if there are no unfortunate weather conditions—well up toward 141,000,000 bushels. The total for the United States is expected to be 700,000,000 bushels. Prices on May 1 averaged the United States over practically $1.40, while the average on May 1, 1914, was 83.9 cents. It now appears that Europe will have great need of our surplus and that good prices will prevail.

SUCCESSFUL SALE

The management having in charge the Schumacher sale of pure bred Holstein-Friesian cattle in Los Angeles has reason to be proud of the most important event pulled off in live stock circles in this state. With an average of $415 on nearly 70 head of cattle a new record is set which will probably be held for a long period. It indicates that the tendency is in the right direction, that our farmers are demanding the best that money can buy. They are demanding it because of the satisfaction there is in handling pure bred dairy animals by reason of their greater production at the pail and the greater prices secured for stock which is not desired on the ranch, and all of this at a cost not exceeding that of the ordinary grade animal excepting the initial or purchase price.

The best part of this sale is that every one of these animals was sold to a California producer. With the impossibility of introducing new blood from the eastern states—and this impossibility will remain until the foot and mouth quarantine is raised—it is desirable that our pure bred stock be used to build up as great herds as possible. It was predicted prior to this sale that because of the dissatisfaction among dairymen near Los Angeles there would be little spirit in the bidding, but with producers coming to buy from several hundred miles away the Southern California dairymen were inspired with a desire to get some of the excellent blood offered in this dispersion, and nearly all of the animals will be kept in the south.

35 CENT DOLLAR

If the orange grower feels that he has a corner on misery because of the small portion of the consumer's dollar he receives, he may take some comfort in the complaint of the wheat grower. The Rural New Yorker has given much attention to the "35 cent dollar" of the farmer and gives the following as proof that 35 cents is rather above the ordinary as the producer's end of the returns:

"A pound loaf was bought at a corner grocery. This loaf weighed 12 ounces including the sanitary wrapper. The best of milling will convert from 70 to 73 per cent of the wheat into flour. We need not ask if the bakers of New York are shrewd enough to buy to the best advantage. One bushel of wheat will yield about 44 pounds of flour. According to the statements of the best bakeries, seven pounds of flour must yield about nine pounds of bread. This means 57 pounds of bread to the bushel of wheat. This means 76 loaves, and the loaf cost six cents on the day it was bought. The poor people of New York therefore were paying $4.56 for the flour in a bushel of wheat. In addition to the flour the miller or somebody else received the benefit of the bran, middlings, or other offal which sold for at least 1½ cent per pound. Here then we have $4.56 paid by people of New York City for the flour obtained from one bushel of wheat. In spite of the high prices daily reported in the papers, we find that the majority of our readers have received not over $1.25 a bushel for their grain. A large proportion of them were obliged to sell last fall for one dollar or less."

SOME ROADS

The editor recently returned from a 400 mile trip over some of the good roads of Southern California, receiving visible demonstration of the great addition these have made to California's wealth. As one, who is an attorney in Cleveland, Ohio, and has come in contact with people who are travelers, remarked, "These roads will bring thousands of dollars to your state in the pockets of tourists who like to enjoy the pleasures of automobiling." This same attorney was unbounded in his admiration of our scenery and our climate which enables its fullest enjoyment. In addition he referred to the greater ease with which all products were moved to market. We believe the wisest step California has ever taken is that towards these improved highways. The country over there is only eight-tenths of a mile of good roads for every square mile of territory. We do not know what California's average is, but it is doubtless below that of the entire country because of the thousands of square miles which are in mountainous and desert sections. In the more populous and developed sections, however, we do not believe any state can exceed us. This is not entirely due to our enterprise in building concrete and macadam roads, for some of our exceptionally fine highways are well graded dirt roads. One county over which the recent trip extended was San Diego. In its valleys and mesas there are hundreds of miles of fine graded roads which are almost equal to concrete Some sections are not so happily located and there a good foundation must be made, but let us encourage more building of substantial and permanent roads by both state and county.

POULTRY COMMISSIONER

California should certainly produce more poultry. We are importing Middle Western eggs and poultry and sending away good gold in payment. The poultrymen of California have been seriously handicapped by the high prices of feed. True, climate has been in favor of the poultryman, but when 25 cents worth of feed is required for 25 cents worth of eggs, even the best of management fails. But it is possible to make investigations which will lead to cheaper feeds, to more effective poultry management, and possibly to cooperative marketing which will enable our state to produce enough for its own requirements.

To that end the poultrymen of the state have appealed to the legislature for the creation of the office of poultry commissioner. The legislature saw fit to grant the request and we believe the bill a most wise one. Now the poultry people fear the governor will fail to sign the bill, and the following circular is being mailed by the Federated Poultry Association of California:

"We have been advised that great pressure may be used to influence the governor to veto Assembly Bill 1539 providing for a state poultry commissioner. The poultrymen of the state convinced the legislature that we should have such a commissioner, but they must now place the governor in a position to know that the poultry keepers of California greatly need this help and urgently request him to sign it in order that it may become a law. This must be done at once.

"T. E. Quisenberry, who is the poultry commissioner of Missouri, says that state exports over fifty million dollars worth of surplus poultry products annually and that California has many advantages for poultry production over that section of the country. We should be exporting to other states instead of importing poultry and eggs from Missouri."

We believe every poultryman and everyone who wishes to see our state enriched by producing its own so far as possible should write the governor and inform him as to the importance of this industry to the state and of the necessity for its encouragement.

Agricultural Notes

The first jitney busses for Hawaii have arrived at Honolulu.

Large quantities of eggs are imported into Argentina from Italy and Spain. The summer price averages 25 cents per dozen, the winter price, 42 cents.

The girls of the garden and canning clubs in Iowa sold a total of $716.71 in fresh vegetables during the year, 3,360 quarts of fruits and vegetables being canned. One member put up 1,000 quarts of these herself.

The Great Central Railway of England is making experiments to see how far women can be employed as railway porters to set free men of military age. At present two women are being employed at Marylebone in this capacity.

In the analysis of the agricultural appropriation act which recently was passed by the United States congress, there is mention of the item of $20,000 for a federal display at the International Soil-Products Exposition at Denver, September 27-October 9.

A large demand for cattle has arisen in Russia and Siberia, in consequence of which large exportations from Chosen, Korea, are taking place. The latest order is for 50,000 head, 20,000 of which are to be Korean cattle, the balance to be supplied by Shantung Province in China.

One hundred and sixty-three cooperative cow-testing associations were in operation last year in the United States. This is considered to be a rapid growth when it is remembered that the first association in this country was organized in Fremont, Michigan, in 1905, and that as late as 1908 only six associations had been formed.

Authority is given the secretary of agriculture by congress to grant leases for national forest land for periods not exceeding 30 years and in areas of not more than five acres each, to responsible persons or associations, for the construction of summer homes, hotels, stores, or other structures needed for recreation or public convenience.

Owing to the difficulty of securing skilled workers, the high cost of land and water, and the increased cost of labor, rice production in Hawaii (which has been averaging over 25,000,000 pounds annually) is decreasing at the rate of 10,000 bags a year. It is estimated by a Hawaiian paper that the 1915 crop will be 60,000 bags less than that of 1909.

A press despatch from Seward, Alaska, reports that on Thursday, April 29, the first spike on the new government railroad was driven by Martha White, who was the first white child born in that region. The engineering commission in charge of the construction of the railroad has issued notices discouraging men looking for work; but very few are to be employed this season.

Announcement was made May 1 of a regular steamship service to Archangel, Russia. The steamer Queensford, flying the British flag, left New York May 18 with a cargo which included 5,500 bales of cotton, several thousand tons of metals, and a deck load of automobiles. Three boats have left for Archangel this season from New York, and regular monthly service will be maintained throughout the open season, which ends October 1. With the opening of the White Sea the port of Archangel will assume increasing importance because of the blockading of the Baltic Russian ports.

Agricultural News Notes of the Pacific Coast

Northern California

Cherry picking is in order in all cherry growing sections.

Woodland, Yolo County, has hopes of securing a milk condensary.

There is a 3000-acre plantation of rice in Colusa County between Colusa and Princeton.

The State Fruit Growers' Convention will assemble at Stanford University the last week in July.

Two 100-ton silos have just been completed for H. E. Coil, a dairyman of Woodland, Yolo County.

The Coombsville farm center of Napa County has established a free employment bureau for benefit of members.

Peach growers of the state are aghast at the load of fruit on the trees which will necessitate great expense in thinning.

The Ferndale Cow Testing Association of Humboldt County has completed six years of work. Approximately 3,800 cows have been tested during the past year.

It is reported that practically 75 per cent of the first crop of Sacramento strawberries was destroyed by the heavy rainstorm the first of the month. Cherries were also injured.

The Humboldt County Dairymen's Association will hold its next meeting at Loleta the first Tuesday in June. Members are interesting themselves in securing funds for a cattle exhibit at the Panama-Pacific Exposition.

Dairymen of Yolo County have found the work of the cow testing association during the last year very profitable. Members are being signed up now for the coming year's work. About 500 cows have already been pledged.

A Durham cow made the highest record for butter fat production for the month of April in the Gridley Cow Testing Association, producing 76.94 pounds of butter fat. Sixteen of the cows tested yielded more than 50 pounds of butter fat during the month.

Estimates of the coming fruit crop indicate that it will be one of California's largest. Canners are refusing to make any very definite statement as to the extent of their operations the coming season. This is said to be because of the high price of sugar.

The California Swine Breeders' Association has elected officers for the coming year as follows: A. M. Henry, Farmington, president; C. B. Cunningham, Mills, vice-president; J. I. Thompson, Davis, secretary-treasurer. J. K. Fraser of Denair, A. B. Humphrey, Mayhews; Alex. D. McCarthy, San Francisco, and J. L. Thatcher, Tracy, were added to the board of directors.

The Yolo County Hog Raisers' Association has appointed a board of hog cholera control consisting of George Colby, Clarksburg; H. N. Van Tassel, West Sacramento; Frank Edson, Knights Landing; J. M. Bray, Dunnigan; Harold Long, Blacks; Richard Jones, Yolo; William Gould, Woodland; Dr. Hayes, Davis; Fred Wilson, Winters; Byron Archer, Madison; H. Hartwig, Esparto; John Winter, Capay Valley.

Central California

Alfalfa candy is the latest.

Experiments are being made at Visalia in raising Belgian tobacco.

There are now 230 acres of grain growing in the old bed of Tulare Lake.

Tulare County estimates a crop of 10,000 cars of oranges the next year.

McKittrick, Kern County, wheat fields were greatly benefited by last week's storm.

Snow fell to the depth of 18 inches in the Sierra Nevada during last week's storms.

A movement is on foot at Fresno to dispose of all of the hold-over 1914 peach crop at once.

Tulare County is sending refrigerator cars filled with strawberries to Seattle and Portland.

The packing of Valencia oranges will soon start in Tulare County. The crop is not large this year.

Beans are becoming an important crop in Stanislaus County. The acreage this year will be large.

It is urged that 100,000 acres now in the bed of Tulare Lake be made into a great reclamation district.

The association of merchants and growers at Turlock has secured $10,000 in subscriptions to its stock.

Wheatville, Fresno County, reports some damage from lodging of grain caused by the recent storms.

Citrus growers of Tulare County met with supervisors at Visalia recently to talk over plans for the control of gray scale.

On one day of last week Gill Brothers of Porterville shipped 600 head of beef steers to San Francisco. The steers were fed on grass alone.

Horticultural Commissioner Collins of Tulare County estimates a 100 per cent crop of figs, berries and peaches; apricots not more than 75 per cent.

Manager Madison of the California Associated Raisin Company will be in Lindsay, Saturday, May 22. He will talk on the benefits of cooperative marketing.

The stormy weather of the first part of the month has seriously disarranged the spraying calendar for apple growers. It will make the schedule about three weeks late.

Citrus growers of the Lindsay district of Tulare County have united to fight gray scale. A permanent organization was effected at a meeting held the 15th at Lindsay.

The Apple Annual Association at Watsonville has elected the following directors for the ensuing year: O. D. Stoesser, J. E. Gardner, W. R. Porter, Mateo Lettunich, Luke Scurich, Geo. W. Sill, J. H. Thompson, E. A. Hall, J. H. Rowe, W. J. McGrath, R. H. Goodchild, E. Steinhauser and C. H. Baker.

The Tulare County Growers' Association has elected W. B. Kiggens of Lindsay president, C. H. Doyle of Porterville, vice-president, and H. L. Pomeroy, Porterville, secretary. This association owns the Porterville cannery and numbers among its members growers from Porterville, Lindsay, Exeter and Farmersville districts.

Southern California

Some small shipments of tomatoes have been made from Heber in Imperial County.

The Anaheim Sugar Company has decided to use natural gas for fuel instead of oil.

Wednesday, May 12, the Northern San Diego County Chamber of Commerce met at Fallbrook.

The Exchange By-products Company has been organized. The site for its location has not yet been chosen.

Over 550 date palms will come into full bearing at the government date farm at Heber in Imperial County.

The storm which recently swept the Pacific Coast piled great quantities of kelp on the state highway between Oceanside and San Diego.

Although the new packing house of the San Fernando Heights Lemon Company has not been completed several carload shipments have been made.

The Ventura County farm bureau has taken up special work for the year along the lines of squirrel control, bud selection and seed selection of lima beans.

Barley growers representing at least 100,000 sacks of grain met recently at Brawley, Imperial County and discussed the matter of organizing a grain growers' pool.

Imperial County claims to replace Humboldt as the biggest dairying county in the state, with a record of $2,495,000 as proceeds from the dairy industry of the county the past year.

Bean growers of Santa Barbara County are interested in the reduction announced in freight rates on beans between California and Atlantic Coast points. The present rate is 85 cents, the new rate will be 53¾.

At the recent annual meeting of the stockholders of the Beaumont Fruit Growers' Association the old board of directors was re-elected with the exception that W. J. Dwyer succeeds J. D. Funk. The year's business showed receipts of $2,412.50.

Walnut growers of the Moorpark section of Ventura County have organized a branch of the California Walnut Growers' Association with a capital stock of $5000. Directors are: William Bauer, W. S. Dunshee, J. C. Thompson, Jno. Laughlin, D. S. Hendry, J. M. Cornett and S. L. Gisler, all of Moorpark.

An extended experiment has been conducted in a Covina citrus orchard in mulching some 400 acres with stable manure. The manure has been entirely placed under the trees. Other experiments in the same orchard have been conducted with straw, alfalfa and other substances. The experiment will be continued and if possible the entire surface covered with a mulch.

The Tri-Counties Reforestation Commtitee met last Thursday at San Bernardino. Among other matters discussed was the plan of spreading the waters of the Santa Ana wash by constructing a dam of wired webbing filled with rock. At present about 7000 inches of water are being spread monthly. The next meeting of the committee will be held in Riverside.

The Coast

Prunes will be short crop is the report from Eugene, Oregon.

The Arizona Farm Improvement Association now has 17 local branches.

The first crate of berries from Kennewick, Washington, was shipped on April 26.

Brogan, Malheur County, Oregon, has sheared in excess of 100,000 sheep, this spring.

Wheat is reported in finer condition than ever before in Eastern Washington.

The Spokane fruit growers have withdrawn from the North-Pacific Fruit Distributors.

The cooperative cannery at North Yakima, Washington, starts out with a capital stock of $100,000.

At a sale of work horses recently held at Lewiston, Idaho, the average price per head was $127.50.

Potato acreage has been greatly increased at Stanfield, Oregon. Alfalfa fields plowed up give large returns.

Klickitat County, Washington, suffered seriously from late frosts, which caused loss of many potato crops. Other than that the crops are looking fine.

The purchase of a band of horses for artillery and cavalry service was made at Okanogan, Washington, recently. The price paid for the bunch was $8000.

Stockmen of Custer County, Idaho, have organized to prevent outsiders from driving in herds of stock on the ranges. The idea is that home stock is entitled to the pasture.

The Idaho legislature has just passed a law creating the office of director of farm products. In addition to aiding the farmers in marketing their products he will maintain supervision of real estate deals.

Awards have been made in the boys' cotton contest at Tempe, Arizona. Results show that every boy entering the contest produced over 300 pounds of lint per acre. The first prize winner was Claud Medlock.

Farm Adviser James A. Armstrong of Maricopa County, Arizona, is interesting dairy farmers in cow testing. It is now proposed to hold a Maricopa County midsummer fair at Mesa this year instead of Phoenix.

The Northwest Fruit Distributors has been reorganized. The president is Frank A. Reeves, Wenatchee; secretary and general counsel, N. C. Richards of North Yakima. The general manager will be J. H. Robbins.

Mohair growers at Brownsville, Washington, organized a pool and sold their entire clip at 33⅛ cents. There were about 12,000 pounds in the pool. A pool of mohair growers at Junction City, Oregon, sold the clip for 32¾ cents.

The Cow Testing Association at Tillamook, Oregon, has a cooperative calf marketing committee. One feature of this association's annual work is a prize of $50 to the best, $30 for the second best cow in the association, and a third prize of $20. In addition there are other prizes for young heifers.

Is your cream can being ROBBED?

Is your separator the thief ?

SUPPOSE you found that some one was stealing even a little of your cream every day. You wouldn't rest easy until you had put a stop to it.

If you are using an old or inferior cream separator, the chances are ten to one that each time you use it you lose some cream. Your cream can is being robbed just as surely as if some one were stealing cream from it.

Some people go on using their old separator even if they know that it is not working right. They fail to realize that if the separator doesn't run right it can't possibly skim clean. They overlook the fact that a De Laval will soon pay for itself just from what it saves over an inferior or half worn-out machine.

If your present cream separator is not skimming as close as two one hundredths of one per cent it will easily pay you to

trade in your old separator on account of a new

DE LAVAL

68,000 users did so last year 34,873 in the U. S. and Canada

You can never get your money back by continuing to use a worn-out or inferior cream separator. The longer you keep it, the greater your loss.

The quickest and best way to satisfy yourself as to the comparative merits of the De Laval and your old machine is to ask the local De Laval agent to bring a machine right out to your place.

He will be glad to let you have a free trial alongside your present machine; and, if you decide to purchase, will make you an exchange allowance on your old machine, whether it be an old De Laval or some other make.

If you don't know the De Laval agent, write to the nearest De Laval office below, giving make, number and size of your present machine and full information will be sent you.

Why not take this up at once? Stop your cream losses and have the satisfaction of knowing that you have a separator that you can depend upon.

EDUCATIONAL BUTTER SCORING CONTEST

By L. M. Davis

WITH 28 buttermakers participating the butter sent to the second entry of the University of California educational butter scoring contest received an average score of 92.19. As a whole the butter was quite a fair lot, no entry scoring lower than 90½, while 32 per cent of the entries scored 93 or above, and over 71 per cent scored 92 or above. The butter was scored in San Francisco after being held in a refrigerator a day to firm it. With the exception of those who do not wish their scores published, the following is a list of scores as placed by T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange; L. M. Davis and H. S. Baird of the dairy division.

P. Bernasconi, Harmony Valley Creamery, Cayucos, 93.

B. Berthelsen, Los Angeles Creamery Co., Hanford, 92.

V. De Carli, Elite Creamery, Nicasio, 99½.

Glenn Decow, Mission Creamery, Perris, 92.

E. L. Dilley, McFarland Creamery, McFarland, 93.

W. J. Grinsell, Libby, McNeill & Libby, Loleta, 93.

Ed Hooper, Spreckels Market Creamery, San Francisco, 92.

J. N. Jensen, Visalia Cooperative Creamery, Visalia, 93.

D. P. Johnson, Riverside Dairy Co., Riverside, 92.

L. Kloekler, Sierra Creamery, Madera, 91.

Simon Koppes, Montague Creamery, Montague, 92.

L. Larsen, Sunset Creamery, Loleta, 94½.

W. W. Leffingwell, Stonyford Creamery, Stonyford, 92½.

A. LeRoy, Exeter Creamery, Exeter, 92.

O. Lommel, University Farm Creamery, Davis, 91½.

R. H. Nelson, Pt. Reyes Cooperative Creamery, Pt. Reyes, 91.

N. C. Nelson, Crescent Creamery, Reno, Nevada, 91½.

E. C. Newman, Lamoille Creamery, Lamoille, Nevada, 93.

P. Petersen, Valley Flower Creamery, Ferndale, 93.

J. C. Phillips, Delta Creamery, Imperial, 91½.

G. G. Plunkett, Visalia Creamery, Visalia, 92.

Wm. Roby, Willows Creamery, Willows, 92.

W. T. Scheld, Inyo Cooperative Creamery, Bishop, 92.

J. W. Smith, Santa Rosa Creamery, Santa Rosa, 93½.

H. Sutton, Minden Butter Mfg. Co., Minden, Nevada, 92½.

G. W. Wright, Woodland Creamery, Woodland, 91.

———, Ceres Creamery, Ceres, 90½.

Cuts for Mechanical Defects

Mechanical defects are a heavy drain upon the score of much of our butter at the present time. In the absence of all cuts under body, color and salt, the average score of the 28 cubes would have been 93, a decided improvement in view of so many lots, each coming from a different creamery and a different locality. Every new season presents its difficulties to the buttermaker, until the making of butter has become a task requiring the closest study and application. One of the points which is of greatest concern to some buttermakers just now is the matter of color. One buttermaker remarks on his method blank that he is having some difficulty at times in keeping the color of his butter from resembling a "U. S. Weather Bureau Map" because of streaks. The close relation between the condition of body and color, and the composition of the butter demands a buttermaker's careful study in deciding upon the details which he shall follow with regard to washing, working, etc. Bad color is especially objectionable on the markets, as a few makers have found out. One market, for example, grades mottled butter a "Second" regardless of its other qualifications. Grade is not determined by score alone, but price is determined by grade. It is perhaps safe to say that most of our creameries could improve the score of their butter by at least a point, by avoiding the defects which must be charged to the creamery. Some buttermakers are crowding the salt limit too closely. This is doubtless done on acount of overrun, but the time must surely come when the folly of sacrificing for overrun those points which make for successful marketing will be realized.

Improvement Noticed in Flavor

That in the absence of cuts for mechanical defects the average score of the butter would have been 93 is evidence of the fact the flavor of the entire lot was generally good. The feed flavor which was so prevalent in the March butter was noticed in but two or three cubes. Suggestions of summer weather were found in some of the cubes, and it is high time that the cooling and proper care in handling cream be urged upon dairymen. A mild feed flavor is less objectionable to the ordinary user of butter than an unclean flavor. Of the 24 method blanks received, 20 or over 83 per cent, report pasteurizing and the same number used starter. Four of the 20 pasteurized entries were made without starter. Four entries were not pasteurized, but starter was used in them. Compared to the reports of contests a few years ago this shows commendable effort on the part of creamerymen to make butter of good flavor. If the same effort would be made to improve the cream before it reaches the creamery, as is made to improve it afterwards, California butter would reach a high standard of quality. Therein lies the greatest hope in the future.

MORE HOGS NEEDED IN ARIZONA

Arizona is short on hogs! Only one state in the Union has a smaller number. The last census gave us a total of 17,208 in the state. Since then the numbers have increased to about 25,000 animals, but this is entirely out of proportion to the place hogs merit in the agriculture of the state, states Dr. R. H. Williams, animal husbandman of the University of Arizona agricultural experiment station. Hogs are especially adapted to many systems of farming throughout Arizona. They thrive especially well and are profitable on irrigated farms where alfalfa, barley, milo maize, skimmed milk and other foods are abundant. Large numbers of pigs may be grown on a small acreage. On one particular farm the owner maintains as many as 700 on 40 acres of alfalfa. They are easily cared for and no other kind of livestock may be turned into money in so short a time and make such large returns.

It is hard to find a reason why more hogs are not grown in Arizona, for we have abundant proof that the conditions of climate, soil, crops and markets obtaining here are especially favorable for their production. Diseases are not as bad here as in the corn belt, and all that is required is that the farmers get interested in hog production. In some parts of the state hogs do well on range alone. The sows are farrowed some time in June and July when the rainy season commences. By the time the acorns fall in July and August the small pigs are large enough to secure considerable feed from this source. Farmers have told me that their pigs will take care of themselves entirely without any feed and dress about 75 pounds when seven to ten months old. Such semi-wild pigs scent dead cattle as far as a coyote, and make splendid gains on the carcasses. This is not a good way of managing pigs, but it is interesting to hear such reports.

Those interested in beginning with hogs should follow some special system of development. The first consideration should be to prepare suitable facilities for handling them, such as buildings, enclosures, pasture and feeds. Each farmer will have to plan his equipment to suit his conditions, but good animals and the best of care will always pay. Those who have a small number of pigs should exercise great care to select only the largest, smoothest sows that make the best mothers. Farmers who have no pigs and wish to stock up should select a few females and gradually increase the number of the herd by keeping the best sows. It would be wise in making purchases to select animals from a first-class herd that has been carefully managed for many years. These old breeders have better stock than can be found by going to a neighbor and buying a "sow." It will also be possible to look over the ancestors of the animals selected and make sure that they are of the correct type and quality.

Farmers who undertake to increase their hog supplies need have no fear of finding a market. Recently a certain man in the state advertised a number of bred sows for sale. He was immediately besieged by people anxious to buy, and in a few days over 30 prospective buyers appeared at his place and offered extraordinary prices. Another man said: "I am an old man now, but if I were ten years younger I would start in the hog business, for there is more money to be made out of hogs than any other way of farming in the Salt River Valley." This indicates that the Arizona farmers are beginning to realize that the future for hog production is assured and want to take part in the profitable business.

SWINE BREEDER'S TEN COMMANDMENTS.

Following are ten commandments that should be obeyed by every intelligent swine breeder:

1. Breed from mature stock.
2. See that they have dry, clean sleeping quarters.
3. See that they are never overfed and no sudden changes made in their feed.
4. See that they have free access to pure water.
5. See that they have good shade during the warm weather.
6. See that they are not obliged to eat their feed in filth or mud, and what is still worse, in the dust.
7. Never feed an exclusive corn diet.
8. Do not inbreed.
9. See that their surroundings are kept clean. In warm weather dust fresh lime around any places that are apt to give off a stench.
10. Keep the following mixture in a dry place where they can help themselves the year round: One load ashes, 100 pounds salt, 50 pounds sulphur 20 pounds copperas, one barrel lime; mix thoroughly. In addition feed charcoal and soft coal.—National Stockman and Farmer.

WHY COOPERATIVE CREAMERIES ARE SOMETIMES A FAILURE.

Cooperative creameries are very important in developing a section along dairy lines, but so many have been started in the wrong way that farmers have cone to believe to a great degree that the small cooperative creamery is a failure. However statistics from Wisconsin and Minnesota show that the large number of cooperative creameries have been greatly instrumental in increasing the output of dairy products, in improving the quality of those dairy products, and in raising the price paid for butter fat in those states.

In the first place too many creameries have been started by promoters who were interested only in getting a good price for their machinery and building, and were little interested in the welfare and future prospects of the creamery. These promoters have created sentiment among the business men of certain towns and have caused them to believe that a creamery would be a great boom to the town and locality. Oftentimes there were only a few cows within a radius of six miles, and perhaps the farmers were not interested in dairying but were following some other line of farming. Four hundred and fifty dairy cows should be available within this radius to make it reasonably safe to start a creamery.

Too often the creamery is organized and operated by the townspeople, and the farmers have little to say in regard to its operation. In order to make a creamery truly cooperative and successful it should be operated entirely by the farmer. The business man in town might be permitted to buy stock and receive dividends, if such were issued, but they should have no word or vote in the operation and control of the creamery unless they are milking cows and sending cream to the creamery.

Poorly qualified butter makers or managers are sometimes responsible for the failure of creameries after they have been organized and started. A butter maker should not be placed in charge of the butter making room simply because he has agreed to work for a smaller salary than another. He should be thoroughly examined as to his qualifications and ability to make butter, and as a rule it is generally safer to employ a $100 man than a $75 man. A butter maker or manager should be educated in making butter and in the operation of the creamery, and should have some experience before being employed as head butter maker or manager.—O. W. Holmes, Idaho Agricultural College.

DAIRY PROFITS AND THE 'DOBE HOLE.

To secure profitable results from the dairy the good health of the individual cow is absolutely necessary. When dairy cows are not in good health they have short appetites and therefore fail to make suitable yields in milk production. The much used term, "No money in dairying," is spread broadcast by the man who thinks his cows can drink stagnant water, eat moldy feeds and still produce a normal flow of milk, declares Prof. G. W. Barnes, livestock specialist of the University of Arizona agricultural extension service. Dairy cows, like human beings, are susceptible to various unfavorable conditions in their environment. So it is important to bear in mind in dairying the necessity of furnishing plenty of clean, pure, wholesome drinking water.

It requires but little searching in the Salt River Valley for one to realize how this important factor for success in dairying has been neglected. The practice of allowing the cows to obtain their drinking water from ponds or puddles in which they are permitted to stand is an undesirable and filthy practice. Not only do the animals contaminate the water which they are required to drink, but this contamination finds its way to the udder. An infection thus started may spread widely as the result of carelessness to every cow in the herd.

More inquiries have come to me about udder troubles than any other one matter and upon investigation at the places I have never found a farm yet which did not have a pond or mud puddle. In some cases a complete quarter of the udder was infected. The herds on these farms were also very thin in flesh and below normal in milk flow. Why should the cows be in this condition of flesh and milk flow? Because the tax upon the system in combating and getting rid of the contamination and filth was so great that the bulk of the food supply went for this purpose and not for flesh and milk production.

Remember that the dairy cow is the hardest worked animal on your place, and do not overload her system with impure water, thus causing a decrease in milk flow of anywhere from 15 to 25 per cent. It is well worth the trouble for any stock farmer (whether he has dairy cattle, hogs, horses or poultry) to provide a clean water supply in troughs or in some other way to prevent the animals from contaminating their own drinking water.

HISTORY OF THE POLAND CHINA

The Standard Poland China Record Association has issued a Pedigree Manual and Short Story of the Early History of Poland Chinas, which it will mail upon request. The secretary is Ray Davis, Maryville, Missouri.

CHOWCHILLA

In our agricultural news note page we recently referred to Chowchilla, Mariposa County. To this the Madera Tribune takes exception and asks us to move that rich section back into Madera County where it properly belonogs. We should perhaps have known this, but being somewhat uncertain which county it was in we turned to the Rand-McNally Pocket Map and Guide of California. This definitely located the town in Mariposa County so we took it for granted the atlas could not lie. We now note that the 1915 edition of the same atlas locates the town properly in Madera County. We are glad to be corrected in this matter.

The Northern Electric will build cattle yards at Yuba City.

A Horse in Harness Is Worth Two in the Stall

You lose money when you put your unpadded horses out to spring work. As soon as they begin working off their winter fat the collars hang loosely and bruise, chafe and gall them. They can't do a full day's work with raw and bleeding necks and shoulders. You lose work and make the beasts suffer needlessly There's a remedy—use TAPATCO Pads—they

Make Your Horses Worth More Money

by enabling them to do more work. These pads keep them free from sores and blemishes so you can get more money for them if you sell them

Filled with our own Special Composite Stuffing. Light, soft, springy and very absorbent. No dirt; no trash; no short, cheap, limy hair with hide attached to attract rats and mice.

TAPATCO Pads are cool and properly ventilated. They quickly absorb all sweat. The cost is only a few cents. One day's idleness of your horse would lose you more than the cost of a year's supply of TAPATCO Pads.

IRISH PIG-FEEDING EXPERIMENT

By Sanders Spencer, in the London Farmer and Stock Breeder

The first reported experiment was said to be entered upon to ascertain whether pigs could be profitably fattened without potatoes. The six pigs used for the experiments were divided into two lots of three each. The first lot were fed on equal parts of Indian meal and pollard for 122 days; the second lot were fed on potatoes and on equal portions of Indian meal and pollard. The increase in weight of the two groups was nearly the same, but was a little superior in the case of the first. Calculating the price fetched by the animals and the cost of their food, it appears that, as the average price of marketable potatoes in Ireland is more than $9.70 per ton, a mixture of Indian meal and pollard costing $1.95 per hundred pounds would generally be a more profitable pig-fattening food than a mixture of the three foods named. The experiment gives no conclusive data, as no mention is made of the percentage of dead to live weight, or of the quality of the meat.

The second experiment was carried out for the purpose of comparing the values of barley meal and maize in the fattening of pigs. In this case also six pigs divided into two lots of three were used. The experiment lasted 76 days. The first lot were given maize, potatoes and skim milk; the second lot received barley meal and a similar addition of potatoes and skim milk. The pigs in lot one appear to have made a greater increase by seven pounds each than the barley-fed lot, but this small variation does not seem to have influenced the reporter greatly, since it is recorded that "the difference in the results from the two foods was so slight that it may be assumed that barley meal is as satisfactory a food for pigs as Indian meal, and it possesses the advantage that it can be produced on the farm."

Similar experiments having the same objects in view were carried out in County Cork, but the details given are fuller and the number of pigs greater.

In the first of the two experiments eight pigs were utilized; they were cross-bred large Yorkshire pigs, presumably the offspring of a boar of this breed out of locally bred sows. The eight pigs were divided into two lots of four animals each. From November 12 to the beginning of February the first lot was fed on potatoes, barley and separated milk, while the second received potatoes, maize and separated milk.

The total increase in weight in the two lots was about the same, while the proportion of dead weight to live weight was 74 per cent in the case of the first lot and 75.4 per cent in that of the second.

A second experiment was carried out, also with eight pigs, no separated milk was given, the animals being fed in the first case on potatoes and maize meal and in the second on potatoes and barley meal.

The daily increase of weight was larger in the pigs given barley meal. The animals showed a decided preference for the latter and would have consumed larger quantities of it than of maize meal. The subsequent examination of the meat showed that, as a rule, the flesh of barley-fed pigs is firmer and of better quality than the meat from pigs fattened on maize. Mention is also made of the fact that some of the pigs fed on maize meal suffered from so-called cramp, while those fed on barley meal were unaffected.

THE DAIRY INDUSTRY.

There is food for a good deal of reflection in the following statistics:

The number of dairy cows in the United States in 1870 was 8,935,332; in 1880, 12,463,120; in 1892, 16,319,500; in 1900, 17,135,633; in 1910, 20,625,432.

The number of acres of improved land in 1870 was 188,920,099; in 1880, 284,771,042; in 1890, 357,616,735; in 1900, 414,438,487; in 1910, 478,451,750.

In 1870 the number of pounds of butter produced was 514,032,683, almost wholly farm butter; in 1880, 806,672,071; in 1890, 1,205,446,605; in 1900, 1,491,752,602; in 1910, 1,619,415,263.

In 1870 the amount of cheese produced was 162,927,382; in 1880, 243,157,850; in 1890, 256,749,683; in 1900, 298,344,629; in 1910, 320,532,181.

Neither the production of butter nor cheese has kept up with the increase of population.

This wonderful growth has added enormously to the material wealth of every community and state where dairying has been the ruling agricultural pursuit. It has also been a powerful aid, wherever it has been conducted intelligently, in conserving the fertility of the soil. This gain to the wealth of the nation can hardly be computed in dollars and cents, but it is great, nevertheless.

One powerful incentive to the expansion of dairy farming has been the great improvement in the quality of the product and consequently the increased price which has come to the farmer. In 1870, practically the whole of the butter and nearly all of the cheese, except in New York and Ohio, was made on the farm.

SOME DIFFERENCES.

Here and there amongst our dairymen are such splendid results attained that one can only be astonished at the complacency with which other so-called dairymen continue to be content with the pitifully small average yields of milk per cow. Why do the huge differences exist?

Just a few miles from here is one of those poor herds, six cows with an average of only 3,338 pounds of milk: the highest yield only 4,000 pounds.

In contrast to that two good herds in western Ontario indicate the possibilities for the man whose eyes are open to what milk records have to teach. One herd of 12 grades averaged 10, 657 pounds of milk and 317 pounds of fat; the second herd of 22 grades averaged 10,542 pounds of milk and 350 pounds of fat.

These marvelous differences in herd yields drive home hard facts. Men differ in their methods of feeding and handling cows, feeds differ in value, cows differ considerably in their inherent capacity as milk producers, they are not all cast in the same mould.

In the above two good herds the constant use of milk records has proved an excellent lever in raising the production. Cow testing pays.—C. F. W.

MAKING FARM LABOR EFFICIENT

The average farmer has within recent years come to investigate carefully the records of live stock that he buys. He has not, however, reached the point where he investigates with the same care the qualifications of men whom he employs. Yet big business concerns have often found a greater loss from inefficient employees than from improper equipment and supplies.

It is true that heavy demand for farm labor at certain seasons of the year often leads to the employment of hands without sufficient investigation of their qualifications. This need not be the case, however, at ordinary times, and in busy seasons it will be worth while for the farmer to pay a higher wage and demand greater efficiency.

A Wisconsin dairyman in securing his help considers whether the prospective employee has strength and alertness; skill in a variety of farm tasks; habits of industry; liking for the principal lines of farming; ability to keep up to schedule; intelligence and faithfulness; intention to earn what he is paid.

In order to obtain the greatest possible efficiency from his help, this farmer plans his work by these rules:

"Do no rainy day work when it is not raining if there is outdoor work needing attention.

"Do no wet land work when the land is dry if there is dry land work to be done.

"In rush season keep busy but do nothing today which can be put off until tomorrow.

"In seasons when there is no rush work the reverse is true—put off nothing until tomorrow which can be done today."

A combination of more efficient help and more efficient planning of farm work will add distinctly to the profitableness of agriculture as a commercial enterprise.—Kansas Industrialist.

TONICS FOR HOGS

Hogs are omnivorous animals and especially sensitive to a lack of variety in their feed. Under domestication they make rapid growth and it is hardly possible to supply them with sufficient quantities of all the food nutrients they require to make the most economical gains. On this account they often become restless and have a craving for certain constituents lacking in the diet, states Dr. R. H. Williams, animal husbandman of the University of Arizona agricultural experiment station. The following mixture has given satisfactory results: Charcoal, 8 pounds; air-slacked lime, 8 pounds; common salt, 6 pounds; hardwood ashes, 8 pounds; powdered sulphur, 4 pounds; powdered blue stone, 2 pounds.

These should be thoroughly mixed and kept in stock so that a small supply may be before the hogs at all times. A low box makes a useful container. Such a mixture is especially cheap and will return big profits in the way of increased gains. It should be mentioned that this preparation is more of a tonic to keep the hogs in good condition rather than a safeguard against disease. At the present time we have no hog food that will save pigs from contracting or dying from hog cholera. This tonic, however, has a beneficial effect in making the animals more vigorous and maintaining them in better condition to overcome the attack of diseases.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

PREVENTING DISEASE

(Continued from Last Week)

Drainage

Dampness in houses, mud puddles in runs, are among the most prolific causes of roup. Indeed, dampness is sometimes put at the very top of the list of disease producers. Dryness means drainage, some way for the water to run off. I know poultrymen, many of them, who succeed admirably on level ground, but this is because they understand the importance of dryness in houses and runs and maintain it without the great advantage which a slight slope gives. It doesn't matter how you avoid dampness, only avoid it as you would smallpox. Good drainage simplifies the matter considerably, but sunshine and ventilation are the two great enemies of both dampness and disease.

Once roup is discovered in the flock, steps must be taken to prevent its spread. First, isolate all sick birds. This is very important. Second, disinfect the roosts and houses where they have been. Kerosene and crude carbolic acid, one part carbolic to three or four of kerosene applied with a brush after the walls have been well washed with the hose, is an excellent disinfectant. Cresol disinfectant, the recipe for which I have given a number of times, is highly recommended. Carbolineum, Zenoleum or any of the coal-tar disinfectants, are all good. Only do the work thoroughly, that not one guilty germ may escape. Third, put some antiseptic in the drinking water to prevent the spread of the disease. Permanganate of potash is generally used for this and is recommended by all experiment stations. Some people use kerosene, just enough to make a slight film on top of the water, but it must be very disagreeable to the birds. Fourth (I should have put this first), clean up thoroughly and find out what is the cause of the trouble.

There is one other cause of roup which is perhaps more important than any other, that is roupy breeding stock. Fowls with roupy ancestry are more susceptible to roup than those of vigorous constitution. If roup were of constant recurrence in my flock, after all sanitary precautions had been taken, I should think it advisable to eat or market my whole flock and begin over again. But before I adopted so radical a measure, I should certainly try that suggested by Dr. Pearl of the Maine Station, and band every bird that ever showed any symptoms of roup or even of a common cold, with a band that never could be mistaken, so that it could never by any chance be used in the breeding pen. We are much too careless about such apparently trifling matters as this. The average poultry keeper (amateur, side-liner, rancher, everybody but professionals) pays very little attention to this fundamental rule of breeding, and puts the best-looking birds, or at the most, the best layers, in the breeding pen, if indeed he does not do worse yet and breed from his whole flock, good, bad and indifferent. If we want to get rid of roup, and the same thing is true of many other diseases, we must stand firm on this principle, that like begets like. Roupy stock breeds roupy stock; vigor begets vigor. There can be no half-way ground.

What has been said of roup applies to nearly all diseases. Chicken pox is more directly contagious, but the germs may be kept alive for years in dark, dirty houses. Prevention implies great care in introducing new birds to the flock. Birds that have been in the shows or are newly purchased should be quarantined a couple of weeks before being allowed to run with the flock, and any appearance of the disease should be the signal for isolation and thorough cleaning and disinfection. Aspergillosis, a disease of the air passages which is caused by mouldy feed or litter, is very similar to roup in its symptoms, and search for mold or mildew should go hand in hand with other cleaning. Moldy food should never be given to fowls of any age. The same lack of ventilation which causes roup is also the chief cause of bronchitis, pneumonia and cold of all kinds. In short, there are just two essentials for preventing disease: Vigorous stock, cleanliness (clean air, clean houses, clean runs, etc.)

FEEDING BROODER CHICKS

Mrs. Whitaker, head of the poultry department of Washington State College, writes:

"I do not think there is any one definite, specific ration that can be used by a sort of rule-of-thumb method for the feeding of all varieties of chicks under varying conditions. Learning to feed baby chicks is cultivating one's judgment in adapting rations to a specific case rather than the adopting of some prescribed method. The care and management of the flock is just as vital as what is fed.

"During the first 48 hours of a chick's life it requires only comfortable, even temperature, sleep, and, toward the end of the period, a drink of water with the chill removed. Care should be used to see that the chicks do not get wet in the drinking fountain or drink water that has become foul or stale. The floor of the brooder should be covered with coarse sharp sand over which is scattered chaff or straw litter.

"At the college the chicks are fed the first ten days rolled oats (breakfast food form) alternated with finely cracked wheat free from bran. The first two or three times we feed upon paper plates or clean cedar shingles, but later scatter the food in the straw litter. By feeding little and often the chicks are induced to scratch vigorously from the start. We keep before the chicks from the beginning all the sweet skimmed milk they will drink. We consider clabbered milk excellent and recommend it in cases where there is a tendency to bowel trouble. The feeding of sometimes sweet milk and sometimes sour to the same flock is not recommended.

"When the chicks are 10 days old, we add to their ration bran with finely sifted beef scrap or granulated bone in proportion by weight of ten parts of bran to one each of beef scrap and bone. This is kept in hoppers which are opened for two hours in the morning and two more in the early afternoon.

"When the chicks are two weeks old the danger of bowel trouble is practically over, and a good grade of corn meal replaces three pounds of bran in the mash. If ground oats are available another two pounds of bran can be well replaced by the oats. From the 21st day on, the oat meal is gradually replaced by sprouted oats. Cracked corn is used to gradually replace part of the cracked wheat until wheat and corn are fed half and half by bulk.

"Where a good grade of commercial chick food can be had at a reasonable cost it can be profitably used in small flocks in place of cracked wheat or cracked corn after the tenth day. We do not recommend the feeding of any corn meal or cracked corn before the tenth day for the reason that sometimes it ferments in the chick's digestive tract, and causes bowel trouble. Moreover, just before feeding one always needs to examine any finely cracked corn or corn meal to be sure that it has not heated in the sack or become mouldy.

"From the third day finely granulated charcoal and chick-size grit is scattered in the straw litter, and a plentiful supply of tender, juicy, finely-cut green food is kept before the chicks from morning till night. Wilted green food is dangerous, and tough green food is useless. Chick weed, dandelions, lawn clippings, clover, alfalfa leaves, etc., make good green food. Of course, a range which supplies green food affords the ideal condition."—Jean A. Koethen.

SOFT SHELLED EGGS.

The frequent laying of soft shelled eggs occasions a considerable market loss in the spring of the year. Mrs. Whitaker of the poultry department of the state college of Washington, offers the following explanation of the causes and the remedies:

The yolk of the egg is fully formed when it breaks from the hen's ovary and drops into the funnel shaped mouth of the oviduct. It is at this point that fertilization of the egg takes place, probably within a few minutes of the breaking loose of the yolk, and in about three hours time the formation of the thicker albumen is completed. The next section of the oviduct secretes the shell membrane, which ordinarily requires about three hours. By the expansion and contraction of the walls of the oviduct the egg is forced forward into the shell gland where the lime of the egg is deposited, and within 12 to 24 hours the egg is laid. One can readily see that anything that would have a tendency to make the egg pass too rapidly through the lower two-thirds of the oviduct would cause the hen to lay soft shelled eggs.

The first and usual cause of soft shelled eggs is that the bird is too fat. The muscular movement of the oviduct is hindered by layers of fat, and instead of the egg being controlled by firm muscles it merely slides through a flabby mass without getting its shell on. The difficulty will vanish if the birds are made to scratch hard in a clean dry straw litter for all their grain, and the ration fed is not over fattening. Sprouted oats will be a valuable food, as they are less fattening than either wheat or corn. In some cases it might be advisable for a few days to omit all mashes, especially moist mashes, from the ration.

The second source of soft shelled eggs is lack of lime in the hen's ration. In this case the shell secreting part of the oviduct fails to do its work because of lack of material. Clam shell is not so readily soluble as oyster shell. What is commercially known as beach shell is preferable to clam shell. It is claimed by some poultrymen that the use of a limestone grit also helps to supply shell material to the hen. It is often recommended that old plaster be broken up and thrown in a box in the pen for birds to pick at as a source of lime.

The third cause of soft shelled eggs is the forcing of hens for too frequent egg production. A second yolk breaks off from the ovary and drops into the funnel of the oviduct, and the first one is forced too rapidly on its way for it to be completely formed when laid.

The fourth cause of soft shelled eggs comes from scouring, that is, from feeding a too loosening ration to your birds. Beets or mangels will sometimes produce this result. The droppings normally should be a dark slate or dull black color, firm enough to maintain a spiral shape as seen on the dropping boards.

If possible, the children, the girls, mind you, as well as the boys, should have some means of acquiring the money necessary to their needs. If every girl had this training, then would the woman consider an income from some source her just due, and not in the nature of a gift, as is too often the case.

All the poised balances of God would swerve,
Did men not get the blessings they deserve;
And all the vigorous scales of Fate would turn,
Did men not get the punishment they earn.

—Edward Markman.

COULSON'S EGG FOOD

Contains every ingredient that hens need—mixed just right to give a balanced ration—makes hens lay longer—keeps them healthy—pays for itself by increasing egg production—saves your time —puts money in your pocket.

Scientifically mixed by machinery from a formula based on years of experience.

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Canker

What is the cause of turkeys having sores under their tongues? What is remedy?—Subscriber, Wildomar.

It looks as if these turkeys had been eating moldy food or scratching in moldy straw. Sometimes canker sores in and about the mouth are caused by male birds fighting, but turkeys do not often peck each other in the mouth, as roosters do. Swab the sores with peroxide of hydrogen diluted to half its strength or stronger, or with a strong solution of boric acid. You may need to repeat the treatment twice a day for several days. Meanwhile look to the condition of the food and litter. Mold develops very quickly these damp days.—J. A. K.

Broilers

I have 500 chickens coming on that were hatched in March. I want to sell off the roosters as soon as possible. What is the proper age to market these roosters to realize the most profit, and how should they be fed after separating them from the pullets? Also wish to cull the undesirable pullets and keep only the best. Can you give a guide as to what should be culled and what to keep? My chickens are White Leghorns.—C. A. N., Paso Robles.

Broilers bring the best price at 1½ pounds, live weight. The cockerels should be separated from the pullets at six weeks of age, confined in a rather small pen and fed soft, starchy foods. A good fattening ration consists of 15 pounds bran, 15 pounds shorts, 15 pounds barley meal, 15 pounds corn meal, 6 pounds meatscrap, 2 pounds powdered charcoal. This should be moistened with sour skim milk or buttermilk till it is crumbly, not sloppy, and fed once a day (at night) the first week, morning and night the second week, and three times a day from this time till the birds are ready for market. For the other meals the first and second week feed as you feed the pullets. When very choice milk-fed birds are desired they are placed the last two weeks in crates where they have little room to move. Six or seven birds to a compartment 35 inches long, 24 inches deep and 16 inches high is about right. Purdue experiment station recommends the following ration for crate fattening of broilers: 2 pounds corn meal, 1 pound shorts, 1 pound ground oats, 8 pounds buttermilk. This should be mixed and allowed to stand and sour 24 hours before feeding. Feed in a trough outside the crate what the birds will eat up clean in 30 minutes. This ration is given three times a day from the time the birds are confined, but should not be continued more than two weeks. Sometimes a week is sufficient.

To weed out the undesirable pullets, remove from the flock from the start any that seem to lag behind the others in growth and any that are not perfectly healthy and vigorous. As they near maturity cull out all that are off color or do not conform in type to the rest of the flock. Just how closely you cull here depends on whether you want a standard-bred flock or just an ordinary laying flock. Squirrel-tails, for instance, are not permissible in a standard-bred flock, but the hens that have them are probably just as good layers as those with tails at the proper angle. You would do well to study the Standard of Perfection and decide just how far you want your birds to conform to it. For laying, however, vigor is the first test. The pullet with the alert eye, quick movements and good appetite is the bird that will lay.—J. A. K.

Poison Oak

Is there any spray which may be applied to poison oak which will kill it?—Subscriber, San Jose.

We have never heard of the pest being handled in this way. As a rule the most satisfactory method is to uproot and burn. We will ask those of our subscribers who have experimented along this line to inform us.

Balanced Ration for Man

I am taking three farm journals. I see articles in them relating to a balanced ration for horses, cows, hogs, chickens, etc., but never have seen an article as to a scientifically balanced ration for a healthy, normal man. What should a man who works in the field all day eat for breakfast, dinner and supper, and how much? When a horse works all day he should get so much feed. When he is idle, in rainy weather for instance, cut his feed in half. How about a man? Of course we can follow our appetites, but I believe an animal can more safely follow his appetite than a man. Our aim in scientific feeding of animals is to get the maximum results and keep perfect health. The majority of people don't know what to eat or how much, to gain those ends.

Why not tell the people how to feed themselves as well as their live stock. I would like to see an article printed giving a good scientific balanced ration for a man who uses his muscle as well as his brain out in the open air all day, which by the way, is the only place for a man to be.—A. N., Paso Robles.

The Cultivator has about the most embarrassing job on earth as it is to keep in touch with various lines of agriculture as practiced in California in this 20th century. No section of the world, so far as we know, has such diverse problems. There are magazines which make the problem referred to by our subscriber their entire business. It is a much simpler one than that with which the agriculturist has to deal, yet with our diverse problems we prefer to leave it to others who are making it their specialty. However, as our subscriber says, the question is a most important one and one which, if we all understood it, would enable all of us to accomplish much more than we do now.

Double Narcissus Blighting

Buds on my white double narcissus which has a most delightful odor all blighted this spring, as they did last year. Prior to that the blooms were almost perfect. What is the cause and remedy?—Subscriber, El Monte.

The narcissus described is N. Alba plena odorata, a double white of the poeticus group, having the strongest odor of any variety. It is a splendid sort for Oregon or England but is not successfully grown out of doors even in our eastern states and I am surprised that the inquirer has successfully flowered it at El Monte. This sort blooms freely only in cool moist climates and does not always form flowers elsewhere. Though flowers generally form and grow to full size the spathe will not split open. The cause of the trouble is hot sun at a critical period and there is no help for it. Grown in shade or partial shade and kept moist it should bring some success.—E. B.

FARM BUREAU NOTES

(Continued from Page 583)

tural Extension, of the University of California.

Future Work of the Farm Bureau in Ventura County, by William B. Parker, Farm Adviser.

Following election of officers, music and games will be enjoyed by those attending.

San Diego County

The Julian local is discussing the advisability and necessity of planting good milling wheat in that district and buying cooperatively their seed for next year.

The Dehesa Local has recently taken up the matter of a uniform wage rate for the labor to be hired during the summer. They are attempting to get the other locals in that vicinity to agree to make the same rate as they do.

At the April meeting of the bureau an executive committee was appointed as follows: H. Culbertson, El Cajon; T. H. Slingsby, Mission Valley, and S. A. Frazier of Lemon Grove. H. M. Armitage, county horticultural commissioner, was elected secretary-treasurer.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Validity of Deed.

A wife deeds her property to her husband; if the deed is not recorded during the lifetime of wife, is it void?—Subscriber, Alhambra.

The question of the validity of a deed is not one of recording, but of delivery; therefore if the deed was delivered during the lifetime of the wife it is valid and may be recorded subsequently.

Stockholders' Liability.

When stockholders in a joint stock concern have held their stock more than three years and therefore are not holding for indebtedness, do they again become liable by paying an assessment?—Subscriber, San Jacinto.

The liability of a stockholder dates from the moment he receives stock in a corporation and is for that proportion of the debts of the company that the stock which he holds bears to the total issued and outstanding stock of the company. This liability runs during all the time he is a stockholder and until by some means he ceases to be a stockholder. He may plead the statutes of limitations against any suit which has been brought against him as a stockholder, just as the corporation may plead such statutes. A payment of an assessment would not render him liable for any debts of the company if he was not before that time; nor does it alter his position with regard to a stockholders liability. If he does not pay the assessment the stock is sold for non-payment and he becomes discharged from any debts incurred subsequent to time of sale.

To Settle Estate.

Is a ranch paid for equally by husband and wife and in wife's name, community property? What is the best way to arrange the matter to prevent trouble by children of former marriage in case of husband's death?—Subscriber.

Community property is that property acquired after marriage by either husband or wife in any manner other than by gift, bequest or devise. It would seem from the question that this property belongs to the separate estates of husband and wife in equal proportions. A will is the best manner in which to settle an estate which a deceased may leave.

Inheritance Tax.

If a family formed a corporation four years ago, only wife and children hold-

The Household Department

FAMILIES CAN HAVE BETTER HEALTH IF THEY CAN

THE balanced ration of many Americans today is made up something as follows: Bread, butter, eggs, meat, fish, potatoes, patent medicine laxatives.

Many Americans customarily suffer from indigestion, constipation or rheumatism. A simple change of the daily menu might go a long way to remedy these ailments. A menu more in keeping with nature's plan is something as follows: Bread, butter, meat, fish, eggs, fruit, vegetables, green. If every home kept on hand enough canned products so that there might be a can of fruits, a can of greens and a can of vegetables for every day during the winter, there would be little need for the laxatives now so regularly purchased from the corner drug store. There would also be great economy in the substitution of an inexpensive food for more expensive ones.

More home canning, done at the proper season, would enable the average family always to have the proper quantity of canned products, and would save an astonishing amount of food that goes to waste every year. It is estimated that over 50 per cent of all the vegetables, greens, fruit, and berries that grow in this country go to waste and are actually lost to those who need them.

Several kinds of simple canning outfits, available for every home, are described in the Department of Agriculture's Farmers' Bulletin No. 521. This also contains valuable suggestions on tomato canning, which are applicable to other canned goods, and includes definitions of canning terms which should be valuable to housewives not familiar with some of the more technical terms.

This bulletin may be secured free by requesting it of your representative or either of our senators or by writing Department of Agriculture, Washington, D. C.

Several Cultivator readers have written of their experience in canning vegetables with home-made appliances. These will be found of great interest.

CANNING VEGETABLES

First Prize Article by Mrs. Floy Crosby Smith, Fairoaks

For ten or twelve years I have canned vegetables for family use and have met with good success. When I have a large quantity of peas or string beans to can I prepare them in the afternoon ready for cooking, pack into glass jars, cover with water and let stand till morning. I use a large wash boiler and lay a thin board in the bottom to prevent too rapid heating.

When using the common Mason jars, I put on the rubbers, and screw them so they will not be too tight to allow the steam to escape. After the jars are placed on the board I fill the boiler with cold water almost to the caps, cover and bring to a boil.

If pint jars are used three hours of vigorous boiling will do, but quart jars need an hour longer. Do not let the water stop boiling for a moment, and fill up with hot water as it boils away.

When the vegetables are cooked enough I lift the jars out one by one with a wire potato masher and without opening (unless the rubbers have broken and require changing), screw them tight. If "Economy" jars are used they require no attention except putting on another clamp besides the one already used.

When I have only a few beans, not enough to pay for keeping up a fire for half a day, I put them into a kettle, salt them and cook as for the table until they are almost tender, then pour into jars, put a tablespoon of vinegar on top and seal. When ready to use the water should be poured off and fresh water put on to complete the cooking. I seldom lose a jar prepared in this way and it is a great saving of time and fuel.

I have had no trouble with tomatoes, salted, cooked in a kettle, poured into glass jars and sealed quickly.

When one cuts a good-sized pumpkin or squash for making pies, there is sure to be some left. I avoid wasting it by cooking the whole thing. What is not used is packed firmly into glass jars—pint size, as each one when opened will make two pies—placed in a big granite kettle with a board or thick cloth in the bottom, boiled three hours and sealed.

Although salmon can scarcely be classed as a vegetable, I have treated it very successfully in the same way. Pack the fresh fish into Economy jars, salt, pepper, cover with water and boil three hours. One of my neighbors uses the same method for canning beef and chicken.

Does it pay? I certainly think it does. Every farmer's wife, miles from a grocery store, knows what it means to have company unannounced, or to be herself detained by callers or unexpected work until the men folks come in for dinner and find her cupboard as bare as the traditional Mother Hubbard's. What a relief it is then to be able to rush down cellar and select fruit, meat and vegetables, ready cooked and needing nothing more than heating and seasoning to become a substantial meal. Besides, the home-canned vegetables taste far better than those we can usually buy and as you know exactly what has gone into them you need not question their standing under the "Pure Food Law."

CANNING ASPARAGUS

Second Prize Article by Ruth Hamilton, Hemet

Select the very best "grass" on the market. Scrape away the outer, woody skin, wash free from dust and grit and cut to length of jars, or, if tips are to be canned, cut as far down as tender. Arrange the asparagus stalks or tips evenly and compactly in each can. Fill with cold water, adjust rubbers, which should be new, and screw down the covers lightly. Place the filled cans in a boiler or deep kettle. Protect from breaking by heat or by touching each other, with slats of wood or wisps of straw on bottom of boiler and between the cans. Fill with cold water to within half an inch of covers. Bring slowly to boiling point, then boil without

Cornstarch Pudding

How to Make This Old-Fashioned, but Always Popular Dessert

One of the most favored desserts in this country for generations has been that ever popular dish—Cornstarch pudding. The following simple recipe for its preparation was taken from a cook book compiled by an eminent authority on culinary subjects, who recommends it as the best that ever came to her attention.

Three cups scalded milk, one-fourth teaspoon salt, six level tablespoonfuls Kingford's Cornstarch, one-third cup sugar, two eggs, one teaspoon vanilla. Mix the cornstarch with a little cold milk. Stir the hot milk slowly onto the cornstarch and stir over water till it thickens. Cook eight minutes. Beat the eggs slightly, add the sugar and salt, add the Cornstarch mixture to the eggs and cook (stirring constantly) one minute longer. Remove from fire, add the vanilla. Serve cold with cream and sugar. (Serves six persons.)

You will note that we have specified Kingsford's Cornstarch particularly in this recipe, because the cornstarch is the most important ingredient and the best results cannot possibly be obtained with inferior brands. Kingsford's can be obtained at all modern grocers. Also ask for the Kingford's cook book containing the above and hundreds of other valuable recipes.

ceasing for three hours, renewing the water from time to time as it evaporates. Unscrew the covers and from boiling teakettle fill the cans to overflowing. Seal the cans at once tightly and pour boiling water into the boiler till the cans are immersed. Boil for another hour, remove, tighten the covers, wipe dry with a towel and invert to test for leakage. When cold, place each in a paper bag and store in a cool, dark place. Beans, peas, and corn can be done successfully in the same way. —Ruth Hamilton, Hemet.

VEGETABLE CANNING RECIPES

Beans, Peas and Corn

I have been successful in canning corn, string beans and peas. I use a steam cooker but have successfully canned string beans without one. I have only canned for home use, but they were perfect.

String the beans, break in inch lengths, cook till tender in salt water just as for immediate table use. Skim out and pack tight in glass cans. Put in enough salt water to cover. Put on rubbers and screw on lids, loosely. Set in steam cooker or a kettle of hot water with pan turned in bottom. Cook three hours. Take one can out at a time and finish tightening lid.

Peas may be successfully canned by the same method.

To can corn shave the corn off the cob, pack in sterilized glass cans. I use the handle of a potato masher to press it in the can tight. Fill the can to the neck or half way up in the neck. Put on rubber and screw on lid, but not tight. Set in steam cooker and steam three hours. Take out one can at a time and finish tightening the lid. —Mrs. C. H. Crabtree, Sanger.

Canned Beans

String your beans and break up as for cooking. Put in a good-sized vessel, salt to taste and cook till done. Have ready some stewed tomatoes. Use tin cans. Put two tablespoons of the tomatoes in the bottom of the can then fill up with the cooked beans and lastly add two tablespoons of tomatoes and put on cover and seal. The acid of tomatoes helps to keep the beans. —Mrs. C. W. McEwen, Modesto.

Canned String Beans

String and cut into one and a half-inch sections crisp green beans. Put into a preserving kettle and cover with cold water, allowing a tablespoon of salt and a tablespoon of vinegar to each quart of water used. Bring quickly to boiling point and boil 15 minutes, then can and seal in glass jars. Beans canned this way and kept in a dark cupboard keep well for winter use. I have canned for home use only and have been very successful.—Mrs. F. B. Phillips, Corning.

String Beans

Select young tender beans, string, break and wash. Have ready a kettle of boiling water, salted or not, drop in sufficient beans to fill one can. Let boil from three to five minutes, from the time they begin to bubble, not longer. Fill your jar, add a tablespoon of hot vinegar and seal. If you are careful to select only such pods as have no beans formed you will never have a can spoil.—Mrs. C. S. H., Ontario.

Canning String Beans

I have been very successful in canning string beans. String the beans, wash them, break in small pieces, then put in quart jars and fill with cold water. Screw lid on with the hand so as not to get it too tight. Then put a piece of pasteboard in the bottom of a large kettle or clothes boiler. Large kettle will hold four quarts, boiler eight quarts. Put enough cold water in boiler so it will be about one inch higher than the jars, as the water will boil down. Boil three and a half hours. Then take the jars out and screw tops down tight. When ready to use them pour water off and cook in fresh water and fix the same as fresh beans. They will keep for years.—M. C., Orange.

Canning Corn

Take corn when grains are well filled. Cut from cob, fill into glass jars, tamp or press very tightly with wooden potato masher until all air spaces are filled and milk forms on top. Be sure to have jars full. Put rubbers and lids on, screwing loosely. Put in wash boiler with water two-thirds up sides of jars, pints or quarts. Boil steadily for three hours. Remove from fire, screw tops on very tightly, leave in water until cool. Then remove and tighten lids if possible. I have been very successful with this recipe, not having had a single jar spoil.—Miss Minta Ehner, Lakeside.

Canning Sweet Corn

Select ears that are plump and juicy. Remove the silk. Cut from the cob with a sharp knife. Pack in sterilized jars until nearly full, adding one teaspoon of salt to the quart; fill jars with cold water. Put on the rubbers and covers, but do not seal them tightly. Have ready a wash boiler with a false bottom made of wire screen or netting. Place jars in boiler, adding cold water to the depth of three or four inches. Set the boiler on the stove and when the water comes to the boiling point, boil one hour. Remove cover from boiler, allowing the steam to escape. Seal the covers on the jars tightly. Let them stand until the next day, repeating the boiling as the day before, but loosen covers during the boiling, after which tighten them and let them stand until the third day when the process is repeated, after which seal them up tightly and put away for future use.

I would advise using the jars with glass covers and clamps as being the best. When I opened the jars this winter the corn was perfectly delicious. And from an economic standpoint home-canned vegetables are far superior to the store goods. Other vegetables can be canned the same way.—Mrs. Charlotte Lammers, San Jose.

JUNE PRIZE CONTEST

Mrs. Gertrude H. Brink of Riverside writes:

"May I suggest a line for some future recipes that would be helpful? I would like to get recipes using sour milk and buttermilk, as soda is so very much cheaper than baking powder. I am sure that tried and tested recipes of this kind would help a great many of us."

Here is the subject for our June contest, one that we know will arouse much interest. We hope to receive many communications. The prize offers will be the same as in former contests.

Prizes

For best recipe $2.00 cash; second best, $1.00; for all published, three months' subscription to California Cultivator. If a member of your family is now subscribing send the name that subscription may be extended.

Those who have received one extension of subscription this year are not entitled to another. All may however compete for cash prizes.

Write Early

Write early. All letters should be in this office by the morning of June 16. Recipes will appear in issue of June 23.

(Continued on Page 599)

Griddle Cakes and Waffles

Their Temptingness Often Marred by Use of Inferior Syrup

Nothing starts the day off any better for most people than a breakfast of griddle cakes or waffles—provided they are properly made and served. Perhaps the most important ingredient to be reckoned with in this connection is the syrup—for syrup not only goes into the making of the cakes, but is used as a dressing for them in serving as well. Inferior syrup, therefore, means unsatisfactory results all around.

No less an authority than Marion Harland, whose advice is prized by housekeepers all over the civilized world, most strongly recommends Karo Syrup for this as well as other purposes. She writes: "I do not hesitate to award Karo the preference above any other table syrup used in my household. As an accompaniment to waffles and griddle cakes, it deserves all that can be said in praise of it. * * * I have also used Karo in the preparation of puddings and gingerbread, with satisfactory results. The candies made from it are pure and delicious."

Insure the best results, therefore, by insisting upon Karo in future. It can be obtained at all modern grocers. When ordering it, ask for the little Karo cook book containing valuable recipes for griddle cakes and waffles, as well as many other tempting dishes.

No More Ants

How One House Was Rid Of This Household Pest

Every woman who is troubled with a house overrun with ants will be interested in the experience of a housekeeper in Oakland, California, who suffered terribly from this pest. Not only was the kitchen and pantry alive with ants, but the insects appeared to be increasing in number at an alarming rate.

Learning of a paste prepared by a baker in Los Angeles—who had a similar experience with ants—the Oakland housewife obtained some of the preparation, with the result that in three days she was unable to find an ant in the entire house.

Everyone will be interested to know that this remedy can be obtained at any drug store. It is put up under the name of Kellogg's Ant Paste. This paste appears to have almost supernatural powers as far as ants are concerned.

Get a package today; follow instructions closely, and your ant troubles will be a thing of the past.

Gas Stove Convenience with Kerosene

Kitchen Economy

With wood or coal—waste heat. Too much or too little for best cooking. In hot weather too much heat coming out into the room.

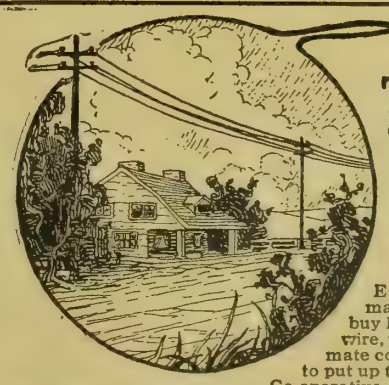
With a good oil-stove—no waste heat or fuel. One burner or four—low flame or high—a slow fire or a hot one. All the convenience of gas for *every* home, all the year round.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Better cooking,—flame adjustable to just the degree needed for roasts, for bread, for pastry. No odor. Does not taint the food. A cool cook and a clean kitchen. Ask your dealer. See demonstration, Palace of Manufactures, Panama-Pacific Exposition.

STANDARD OIL COMPANY
(California)
Los Angeles



The Modern Idea

Get in touch with the world. Farm telephones help business, help farm life—save time and money. A few men in your neighborhood can get together and easily build a local telephone farm line.

The line is simple, easy to build
The telephone is easy to install
The cost is not excessive
The upkeep is small

Especially are these things true, when reliable, made-to-last telephones are used. Each man can buy his own telephone, then decide upon the cost of wire, poles and supplies. We will tell you the approximate cost, what material is needed and show you how to put up the line free.

Co-operative farm lines are not a new idea. They are being operated in many parts of the world now. Very many thousands of Kellogg telephones are installed today—many in service for eight or ten years in all parts of the United States.

Kellogg Telephones

Kellogg farm telephones save you money because they are practical and well built; do not get out of order easily, give unexcelled transmission which means that the bells ring properly, that you can hear and be heard clearly and distinctly.

Ask our practical telephone men at San Francisco for our illustrated bulletins that tell in a plain, understandable way how our telephones operate and why they save money.

We will send you these bulletins and help you build your line in any way that we can. Tell us what you want and the conditions under which you will build your line. **Write for bulletin 24.**

HAY

Under date of May 15, Scott, Magner & Miller say:

Receipts of hay have decreased materially during the current week, only 1800 tons being received during the past six days. For each of the two previous weeks over double this amount came in. We have been able to move some hay for foreign account, thereby getting it off of this market and relieving the situation somewhat.

The continued rains have caused an unsettled condition as far as cutting is concerned. Very little alfalfa hay has come in recently and prices have remained unchanged.

We quote the average wholesale prices in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	11.50@12.50
No. 1 Wheat or Wheat and Oat	9.50@11.00
No. 2 Wheat or Wheat and Oat	7.00@9.00
Choice Tame Oat	11.00@12.00
Other Tame Oat	6.00@9.00
Barley	5.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6,00@9.00
Stock Hay	4.50@5.00
Straw, per bale	.30@45

GRAIN

Alfalfa Seed	16½
Wheat, Cal. Club	2.22½@2.25
Corn, Egyptian White	1.75@1.85
Corn, Eastern Yellow	1.77@1.78½
Barley Feed	1.17½@1.22½
Oats, Red, Feed	1.52½@1.60
Oats, White Feed	1.77½@1.80
Millet	2½@3¼
Flaxseed	5@5½
Rye	2.00@2.25
Sunflower	5@5½

FEED STUFF

Wholesale prices.

Alfalfa Meal, car lots	13.50@14.50
Bran, ton	26.50@29.00

Oilcake Meal	38.00@39.50
Cocoanut Oilcake Meal	24.00@25.00

Citrus Fruit Market

LOS ANGELES, May 18, 1915.

The shipments of oranges during the last week have exceeded those of any previous week in the history of the orange industry, excepting the fourth week of May last year. This excessive shipping is probably due to the rains of the early part of the month, which caused a stoppage of nearly all orange packing activities, but it is hoped that these large shipments will not weaken the market, and good cause for the hope is given in the fact that the shipment of cantaloupes has been delayed by comparatively cool weather and that the cherry crop has been seriously reduced by the unfortunate weather conditions. Reports at this writing are that market conditions are fully as strong as last week. Navels will continue shipping for the remainder of this month, nearly all the stock will go forward before the end of this week. Shipments at the present time are about equally divided between navels and Valencias.

With the thermometer registering 40, or even lower in some of our lemon markets, but little fruit is being sold. The lemon market is more largely influenced by weather than is that of any other fruit, and until conditions change over the East there will be no extensive demand.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 23,764 cars; lemons 3,418; total, 27,172. To same date last season, oranges 24,847; lemons 1329; total 26,176. From Tulare County, oranges 5,293 cars; lemons 196; total 5,489. To same date last season, oranges 4,910; lemons 30; total 4,940. From northern counties, oranges 628; lemons 2. To same date last season, oranges 402; lemons 5. Total of all citrus fruits shipped from the state this year to date, 33,301, last season 31,584.

NEW YORK, May 17.—Twenty-eight cars navels, one Valencias, three St. Michaels, four budded, fourteen mixed cars, and six cars lemons sold. Market strong on navels; lower on lemons. Raining.

NAVELS—	Avge.
Orchard, imp., National O. Co	$3.30
Standard, imp., National O. Co	3.10
Orchard, National O. Co	2.60
Standard, National O. Co	2.35

Gold Medal, G. O. Groves	$3.25

PITTSBURGH, May 17.—Fourteen cars sold. Market is strong on oranges, lower on lemons.

NAVELS—	Avge.
Majesty, O. K. Ex	$2.80
Owl, O. K. Ex	2.15
Flyer, O. K. Ex	2.70

LEGAL QUERIES

(Continued from Page 595)

ing stock, do they have to pay inheritance tax, and if so, what is the rule to go by?—Subscriber, Inglewood.

When a transfer of property is made without valuable consideration in contemplation of death or intended to take effect in possession at such death, it is taxable under the inheritance tax law. Transfer being made four years prior hereto, it would hardly seem that it would fall under this section.

Ditch Right.

If A buys a piece of land with ditch through it, which he agrees to keep open for his neighbor B, and B agrees to keep the ditch clean and fails to do so, then what is A's privilege? Can he refuse to keep the ditch open or will it be lawful for him to close it?—Subscriber.

If there was a mere license to B to have the ditch kept open A may at any time revoke that license, unless it was for a specified time. If however B has acquired a right in the land of A to have the ditch kept open through his land, then the sole remedy of A is to clean the ditch and sue B for the value of the labor performed in cleaning said ditch.

Labor Commission.

I baled hay for a man and the bill amounted to $420. He paid me $200 and refused to pay all of balance because of damaged hay, but hay was damaged after baling. Would this be a case for the labor commissioner?—Subscriber, Wasco.

You do not state the nature of your contract for baling the hay. If you are not an employee the labor commission would have no jurisdiction. If by the contract it is an employment, the work falls under the term, seasonal labor, which is defined,—for a period greater than a month, and where the wage for such work is not to be paid at any fixed intervals but at the termination of the employment, then it falls under the jurisdiction of the labor commission and prosecution may be commenced thereunder.

Eight Hour Law.

What is the law about working women more than eight hours in a citrus packing house and what is the smallest wages that can be paid women? Who should look after these things?—Subscriber. La Habra.

No woman can be employed in any manufacturing, mechanical, or mercantile establishment, laundry, hotel, hospital, place of amusement, restaurant, telephone or telegraph establishment or transportation company, more than eight hours during one day or 48 hours in one week. This act expressly excepts the hours of employment in harvesting, curing, canning or drying any variety of perishable fruit or vegetables, also excepts graduate nurses. There is an act providing for an industrial welfare commission, which commission is given the power, after a hearing, to fix a minimum wage to be paid to women and minors engaged in any occupation, trade or industry, which wage shall not be less than a wage adequate to supply such women and minors with the necessary cost of proper living to maintain their health and welfare. The commission may also fix the maximum hours of work and conditions of labor.

Trees on Highway.

Who is responsible for damage caused by trees along the public highway and located on the public right of way: in the case of county roads; in the case of state highways?—Subscriber, Santa Ana.

The above is an exceedingly complex question, more so as there has been no decision construing the respective liabilities, and the opinion here given is therefore based merely upon a reading of the various acts relative to highways and can be taken for no more than the personal opinion of the writer, as to the probable construction of these different acts.

In the first place, relative to state highways. Highways within a county may be improved by aid from the state upon application made therefore by the board of supervisors of the county. The state highway aid act provides that said highways shall be constructed and kept in good repair under the supervision of the engineer of the county. It may be generally stated that the state, being sovereign, cannot be held liable for any damages nor can it be sued upon any ground unless express permission is given therefor. As no express provision is apparently made whereby the state may be held liable for injuries upon state highways, it is undoubtedly true that the liabilities must rest somewhere else, and as will hereafter be seen, will probably center upon the road commissioner and the adjoining owner can hardly be held liable, as under the forestry act the board of supervisors may appoint a county board of forestry, which is given exclusive right and control of all trees grown upon public roads and highways. This act further provides that it is unlawful for anyone to trim, prune, cut, deface, destroy or remove any shade or ornamental tree or hedge growing upon such road or highway, except fruit or nut trees, which may not be removed without the consent of the forestry board and providing that anyone who shall violate any of these provisions is guilty of misdemeanor. The act provides for the appointment of a head forester who is required to execute a bond for $1,000 for the faithful performance of his duties. This board is expressly made subject to the authority of the board of supervisors and it is provided that it shall not interfere with the jurisdiction of that board over the roads and highways in the improvement or general control thereof, thus apparently making this board a mere agent of the board of supervisors. For gross negligence in the conduct of the duties of this board and also of the forester employed, it would seem that they could be held liable. The body upon which liability has at all times heretofore rested, and upon which it would seem to now rest unless expressly taken away is the road commissioners of each county. The road commissioners are merely another name for the supervisors, as section 2641 of the political code provides that the board of supervisors of each county shall divide it into suitable road districts and each supervisor shall be ex-officio road commissioner in his supervisoral district.

Section 2645 of the same code provided that the road commissioners under the direction and supervision of the board of supervisors must take charge of the highways within their respective districts, keep them clear from obstructions and keep in good repair, and it has been held in a recent case against R. W. Pridham, one of the supervisors and road commissioners of the county of Los Angeles, that these road commissioners are liable, but only to the exercise of a reasonable degree of care, the question of what constitutes a reasonable degree of care being entirely for the jury. In this case it was held that the remainder of the board were not liable, the liability being only upon the road commissioner, who was Mr. Pridham. The decision against Mr. Pridham was, however, reversed upon other grounds.

So it would seem that the liability for damage remains upon the particular road commissioner of the district wherein the damage is occasioned.

THE FARMER'S HOME

(Continued from Page 581)

ment of cash, but which, if living in town must be paid for in cash at town prices and from the farm revenues.

United States department of agriculture Farmers' Bulletin No. 635, "What the Farm Contributes Directly to the Farmer's Living," discusses this matter with reference to the portion of the country east of the Rocky Mountains.

Studies were made in ten states, three cotton growing, two corn belt, two general farming and three typical dairy sections, to determine what proportion of the food, fuel and shelter needs of the family was met by the farmstead without cash outlay, and how much of these had to be bought. It was found that the average annual value of the food, fuel, oil and shelter per family was $595.08, of which $421.17 was furnished by the farm and $173.91 purchased.

The bulletin concludes with the following observations:

"The result of these studies shows that the farmer's cost of living in actual cash expenditures is very materially reduced by what the farm furnishes in food products, fuel and house rent; in fact, the income from this source adds as much to the real wealth of many farmers as does the net income from the sale of farm products.

"If it were not for those products contributed by the farm without any actual cash expenditure, a great many farmers would not have a comfortable living. Extensive investigations relative to the profits in farming indicate that the average labor income of the farm probably differs little from ordinary farm wages, but in addition to this, he has the products contributed by the farm, as discussed in this bulletin."

JUNE PRIZE CONTEST

on the side hill whether new or old

In side-hill work the superiority of Yuba Ball Tread Tractor track design is most convincingly demonstrated.

No matter how steep a side hill may be, nor how much side pull a load may exert, the track never comes off.

A curved projection on the inner side of each link in the track forms half of the ball race. By means of this the balls are securely held in place and the tread locked on. When the tractor is running on a side hill the weight-bearing points on the balls are changed from top and bottom to the sides. The balls, by reason of their ability to roll in any direction, are able to take this shift without affecting the operation of the machine or reducing the power delivered in any way.

THE YUBA BALL TREAD TRACTOR

After being in service for a year—or several years—The Yuba Ball Tread Tractor will be as ready to plow on a side hill, work on a levee or haul a load coupled to one corner as on the first day it goes into operation.

A more complete explanation is given in a booklet entitled "The Yuba Ball Tread Tractor."

Cultivate with a "Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator.

Catalogues of this and larger size tractors for the asking.

An Overproduction of Apples ?

The present demand for apples in the United States, including those used for export, is placed by the Department of Agriculture at 55,000,000 barrels. If that many apples were raised in this country there would be no overproduction. Figures from the Department of Agriculture show there has been an average annual decrease of 25 per cent in the apple production during the last nine years. The serious shortage that exists for apples is attributed largely to the dying out of the old orchards and the insufficient plantings of new ones.

The Yucaipa Valley, eight miles from Redlands, altitude 2400 to 3000 feet, is the place to plant an apple orchard, and this is the time of year to visit Yucaipa and see what you would have if you had planted four years ago. It is not too late to make a start.

Come to Redlands and let us take you to Yucaipa and show you our five, ten and twenty acre tracts at $285 per acre, on very easy terms. One share of stock in a Mutual Water Company with each acre.

Melons---Cultural Methods

California Ships Thousands of Carloads of Casabas, Watermelons and Muskmelons. General Planting and Cultural Directions are Given Cultivator Readers

By S. S. Rogers

CALIFORNIA has long been regarded as the home of the melon, due largely to the hot summers and the favorable soil and moisture conditions. In 1909 California lead all the states in the production of muskmelons, there being grown that season about 5,784 acres. The yearly production of watermelons in California would probably amount to several thousand acres and in fact the industry is so large that it is considered a leading one of the state. The leading melon sections of California are found throughout the

Armenian Tpye of Casaba
A New Seedling of Great Promise

San Joaquin Valley, between the towns of Modesto and Fresno, especially in the vicinity of Turlock. In the Sacramento Valley, Lodi, Stockton and Sacramento are large producing sections and a large percentage of the melons used in the northern and central portion of California are grown in these districts. In the southern part of the state the chief melon center is the Imperial Valley and certain sections of Los Angeles and Orange Counties. In many other parts of the state a considerable amount is produced, but the acreage devoted to these crops is very small compared to the other sections.

Yields, Cost of Production and Prices.

The yields vary considerably from one season to another and from one locality to another. The average for watermelons is from 1,000 to 1,200 averaged sized melons per acre. The average cost of growing melons under California conditions is estimated to be from $25 to $40 per acre and the average gross returns vary from $75 to $200 per acre, depending largely upon the season.

Cultural Requirements.

The cultural requirements for melons are not as exacting as for some other vegetables, although they will not do well unless they are grown under the right climatic, soil and cultural conditions. The soil best adapted is one of a sandy loam nature which holds the moisture well. If too heavy, the growth is apt to go to vine at the expense of the crop, whereas if it is of too open a character, such as coarse sand or gravel, it will be difficult to retain a sufficient amount of moisture for the proper growth of the crop. Soils which are too rich in nitrogen should be avoided for the vine growth will be luxuriant but the yield will be small. While the melons do not require as much soil or atmospheric moisture as some of the other vegetables, there should be a sufficient amount in the soil to produce a good vine growth. If the amount of soil moisture is abundant, this crop does better where the atmosphere is hot and dry. It is very important that the proper climatic conditions be found when growing this crop, for it does best in a hot dry climate where there is an abundance of sunshine. This is one of the most susceptible crops to low temperature and should not be grown until the weather has become warm. The preparation of the soil should be such that at the time of seeding it is free from weed growth and has a fine mulch on the surface. Soil which is to be used for growing melons, especially where irrigation is not used, should be deeply plowed in the fall and well worked in the spring just previous to planting. The proper distance apart for the hills depends largely upon the character of the soil and the water supply.

The average distance between the hills for watermelons varies from eight to twelve feet; the most common distance is 10 by 12, but if cantaloupes or muskmelons are to be grown, these distainces can be reduced to 6 by 8 or 8 by 8. The planting should not be done until the soil has warmed up considerably in the spring and until the danger of frosts is past; and it is sometimes best to make two plantings about two weeks apart. The bulk of the melons are planted between April and June, inclusive; under ordinary conditions April and May are the most favorable months.

It has been shown by experience that there is very little to be gained by planting too early in the season for if the vines become stunted from a sudden cold spell the development of the crop will be much retarded. It is important that enough seeds should be sown to allow for rotting, poor germination, etc. Many growers sow as many as 12 to 15 seeds in a hill and later thin to three or four vines. The seed should be covered with about one to one and one-half inches of soil, care being taken not to plant them too deep.

Irrigation.

Many melons are grown in California without irrigation but where it is essential the water should be applied before the vines have attained their full growth for at this time it will be impossible to put the water on in a satisfactory manner. This crop is seldom irrigated more than two or three times during the season. After the melons are maturing they should not be irrigated under any circumstances for by applying the water at this time the quality of the crop is much impaired and it is liable to rot the melons. The common method for applying water is in furrows along the rows of plants, furrows being made by the plow or several of the cultivator attachments.

Cultivation.

The cultivation should be given in such a manner that as much of the moisture as possible is retained in the soil, and the weed growth should at all times be kept in check by thoroughly cultivating when the vines are young. This can be stopped when the vines have begun to cover the ground, for these should not be disturbed. If the weeds are bad, after the vines have grown so as to make cultivation impossible, they can be hand pulled.

Harvesting.

As a rule the melons should not be harvested until they are nearly ripe for if they are pulled from the vines too soon their keeping qualities and flavor will be greatly injured. There are several methods of telling when a melon is in the proper condition to pick. The one in most common use is by thumping; the experienced grower can tell the condition of the melons by the sound which they make. Melons which are to be shipped a considerable distance should not be as nearly matured as those which are to be used in the local markets. The muskmelons and cantaloupes are generally sold in crates while the watermelons are sold loose.

Varieties.

Of the many varieties of watermelons found in the United States comparatively few are grown in California. In the southern part of the state the Chilian and Angeleno are the most popular varieties. In the central and northern portions the Kleckley Sweet, Florida Rattlesnake Chilian and Tom Watson are most commonly grown.

Columbus Casaba

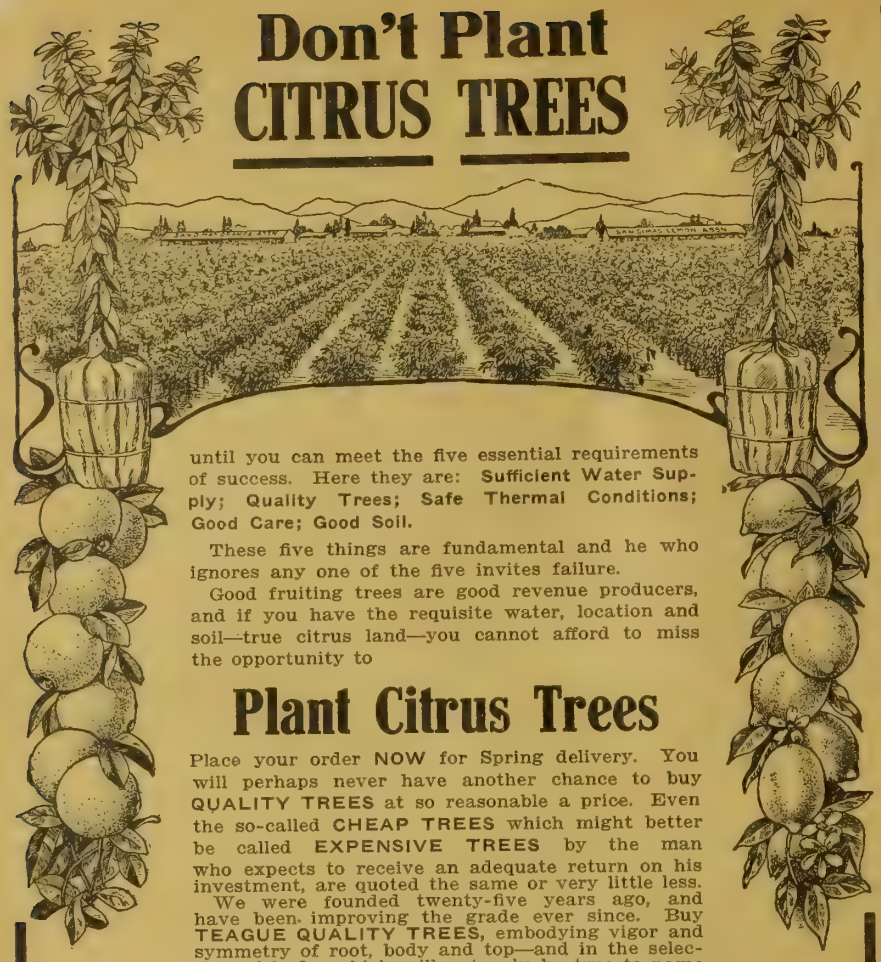
The above is one of the newer seedlings, somewhat resembling the ordinary cantaloupe. Has yellow flesh, exceptionally fine quality. The casaba is comparatively new and for a time was thought to be only for late fall and winter trade and to be adapted only to the near coast portion of the Southwest. Hybridization has developed new sorts until it is giving us some of our early summer fruits and the territory has been extended till it now grows all over California and in parts of the East. Plant according to locality. In some favorable sections they are planted from the middle of February to July 15. For the winter shippers the late planting is best. The best way to keep the casabas late into the fall is to gather them together on the hill and cover them completely with the vines, but do not pick them off the vine.

Diseases.

The most serious disease with which the watermelon growers have to contend is the wilt. This is characterized by the dying of the vines soon after they begin to grow their runners, up to and including the time at which the melons are ripening.

This comes on very generally after the crop has been grown for several consecutive years on the same land, and in many places has prevented the growing of this crop. It is caused by certain organisms which live in the soil and is controllable only by crop rotation. This disease is not found on the cantaloupes or muskmelons. The latter are not affected by any serious disease but are often troubled by the melon aphis which during certain seasons is very common through the Imperial Valley. Several methods of control have been advocated but as a rule they are very hard to get rid of.

Don't Plant CITRUS TREES



until you can meet the five essential requirements of success. Here they are: **Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.**

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order **NOW** for Spring delivery. You will perhaps never have another chance to buy **QUALITY TREES** at so reasonable a price. Even the so-called **CHEAP TREES** which might better be called **EXPENSIVE TREES** by the man who expects to receive an adequate return on his investment, are quoted the same or very little less.

We were founded twenty-five years ago, and have been improving the grade ever since. Buy **TEAGUE QUALITY TREES,** embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the term, but true to the best type of the varieties to which they belong as well.

Write today for prices and particulars. No orders too large or too small to fill. All correspondence promptly answered.

Citrus and Tropical Fruits

OLIVES IN ARIZONA

WE recently wrote Prof. Forbes, director of the agricultural experiment station of Arizona, requesting that he give information regarding the olive, its oil, and the industry in general to an eastern experiment station which was urging the use of cottonseed oil as the equal of imported olive oil. Mr. Forbes complied with our request by sending bulletins and circulars issued by the Arizona station, which has done much valuable work with olives, and in addition wrote a personal letter touching upon the importance of the industry to Arizona. From this we quote:

"For some time it has been evident that we have conditions in the arid Southwest favorable to the growth of the olive tree and to the production of remunerative crops of fruit. This fruit may be used for two purposes—for oil-making and for pickles.

"With reference to oil production, this varies greatly of course, according to the varieties of olives used and to the skill and cleanliness with which the oil is manufactured. There is no doubt, however, of the fact that in time to come we will have an oil industry of considerable magnitude in the Southwest, affording a supply which at the present time is almost entirely imported from the Old World. We are therefore interested in the encouragement and development of a home industry in olive oil.

"There are perhaps even greater possibilities along the line of pickle manufacture in this region. There are two general classes of olive pickles: first, the green pickles, the taste for which has come to us through the English, who are, of course, great eaters of relishes, pickles, etc., of all kinds. Second, ripe pickles which are a rich and nutritious food and also much more palatable to properly developed taste than the green pickles. We have learned to eat the ripe olive pickles largely through the Spanish and Italian residents in this country who have brought their taste for this food to this country with them. Italian and Spanish workmen, in fact, make their midday meal oftentimes of a handful of ripe olive pickles and bread. The ripe olives therefore have possibilities as a staple article of food, and a large trade in this community will therefore probably be developed as rapidly as the raw material for its manufacture is available.

"Very satisfactory yields of excellent fruit have been obtained in southern Arizona, which is perhaps even better adapted to the culture of the olive than those portions of California which are within influence of the sea.

"At the station farm, Phoenix, Arizona, a yield at the rate of 9315 pounds per acre from ten-year-old Columella olive trees, planted 40x40 feet apart, was figured, which at $35 a ton would give a gross income of $162.81 per acre. Deducting necessary expenses for irrigation, cultivation, pruning, etc., amounting to a total of about $20 per acre a year, more or less, under pumping, and then discounting the estimate, there would still be left a good profit to the grower. Of course, pickling olives are worth more than olives for oil, from $60 to $75 a ton being paid for pickle olives in Salt River Valley, while olives for oil are worth $20 to $35 on the trees.

"In southern Arizona there are considerable areas of comparatively cheap lands, with ground waters at pumping distance from the surface, which are worthy of consideration for olive planting, the merits of the tree being that it endures our climatic conditions, grows with comparatively small water supply and affords a crop which can be converted either into oil or into a suitable food. The by-products also have various uses. Second-quality oil can be used for making castile soap, and the extracted residues can be used to feed poultry or as a fertilizer.

"While therefore the olive is a slow growing tree and requires a period of from five to eight years to come into bearing, it will yet undoubtedly be planted in the Southwest as a standard orchard tree."

DOUBLE FUMIGATION

There have been 60 acres in the immediate Covina Valley that have been fumigated twice this season. While this has been done before in other seasons by a few ranchers, the prevailing opinion has been against it in former years, the belief being that one fumigation well done would clean the orchards, but ranchers are now seeing the advisability of catching the black scale when it is hatched out, regardless of whether the orchard has been previously fumigated that season.

Contrary to what would be supposed to be true, the movement for a double fumigation has come from the rancher and not from the concerns engaged in fumigating. Some of the acreage fumigated by the Covina Citrus Association has been done twice, the work being ordered by the ranchers because the black scale no longer seems to hatch at a particular season, but is liable to infest orchards at various times in the year.

During the last year many ranchers have been convinced of the bad policy of allowing the groves to get dirty, as in many cases nearly the whole of the crop was sacrificed because the rancher did not fumigate. All Covina ranchers are stronger in the defense of fumigation than ever before in the history of the industry, and they are going a step farther and making a second fumigation, being convinced that this is money well spent.

It is thought that if the groves are fumigated twice and are once well cleaned up, the necessity for double fumigation may disappear after a few years, as the scale will then get evened up in the hatching. What is known as a certainty, however, is the fact that it pays to keep the orchard clean. Some ranchers lost crops worth $3000 because they did not spend $250 or $300 in fumigation this year. The fumigation bill may be higher with some ranchers for one or two years, but they believe that it will be money in the pocket for them to get the groves thoroughly cleaned.—Covina Argus.

ROOT HAIRS

The root system of a plant is divided and subdivided into many fine rootlets. There arise from the surfaces of all growing rootlets, very small simple structures, the root hairs. Practically all the water and mineral nutrients are taken in from the soil through these root hairs. The absorbing surface of a root with hairs is from five to ten times that of a hairless root of equal size. The importance of root hairs may be judged from the above statements.

Root hairs are being formed anew constantly. The life of any individual hair is very short as a rule. They are extremely sensitive to air and soil conditions. They collapse immediately on exposure to air. Cold soil and very wet soil retard their development.

Usually, when a seedling is transplanted, the root hairs die immediately. Wilting of the plant results, and it does not revive until new root hairs are formed. In order to compensate for the destruction of root hairs in seedling transplanting, it is customary to cut back the water-losing organs, the leaves. In transplanting seedlings, pains should be taken to preserve the finer, young, growing, and root hair producing rootlets.—W. W. Robbins, Colorado Agricultural College.

Petitions are being circulated in Fresno County asking the board of supervisors to call a bond election for a $3,000,000 good roads system in that county.

STATE FRUIT GROWERS' CONVENTION.

By Dr. A. J. Cook, State Commissioner of Horticulture.

No fruit grower should forget the Forty-sixth California State Fruit Growers' Convention which is to convene at Stanford University the last week of July; indeed, all should plan now to be present at this convention which meets the week before the meeting in San Francisco of the American Association for the Advancement of Science, so we shall have with us some of the greatest scientists of the country. Soils and their treatment will be discussed by some of the highest authorities on the subject; two sessions or more will be devoted to the potato industry; the causes that hinder success in potato production will be discussed by those who know; pear blight which is laying so heavy a hand on our fruit growers will be ably considered by scientific authorities and by orchardists who have successfully controlled this most obdurate of bacterial diseases, and there will be a symposium on the outlook of the various fruits grown in the state by men who have made a success of their culture. Miss Lillian D. Clark of Berkeley will have charge of the women's session and this is enough to insure their success. We hope and believe that these sessions will fall no whit below the interesting meetings held by the ladies at the Los Angeles convention. Monday and Tuesday, July 26 and 27, will be given to matters of special interest to the county horticultural commissioners, their deputies and inspectors; Thursday, the 29th, will be devoted in part at least to an automobile trip through the famous Santa Clara Valley, and on Saturday the convention will adjourn in a body to meet at the exposition in San Francisco. Here special pains will be taken to explain the great plant exhibits, and in the evening an address will be given by Dr. John Coulter of the Chicago University. Saturday will be "Horticultural Day" at the exposition.

BOOKKEEPING FOR COOPERATIVE ORGANIZATIONS

Double entry bookkeeping is urged upon all farmers' cooperative societies in a recent publication of the United States department of agriculture, Bulletin No. 178, "Cooperative Organization Business Methods." The very life of a cooperative organization, says the bulletin, depends upon the confidence its members possess in it, and such confidence is impossible unless the records are unmistakably accurate. The double entry system is the only one which affords a complete check and should therefore be adopted in all cases.

Since the cooperative organization acts as the agent of the grower in marketing his product, the books of the organization must not only contain the usual records of any business enterprise but must also show a clear record of each grower's shipments. The system must be sufficiently elastic to take care of the maximum volume of business at the busy seasons and at the same time be economical.

The six essential requirements for such a system are stated in the bulletin as follows:

A complete set of financial records showing the business transactions and the results thereof.

A record of each member's transactions with the organization.

Capability of taking care of a maximum amount of business during the shipping season.

Capability of returning to the members the proceeds from their products within a reasonable time.

Clear pooling records when kept, so that any discrimination can be shown quickly.

Auxiliary records which will give statistics and valuable information for the conduct of the business. These records must be accurate.

The necessity for providing a regular system for safeguarding the cash is also emphasized in this bulletin, and nine precautions are given which it is said should be adhered to strictly.

All entries of cash should be explicit, and items supporting such entries should be filed so that they are accessible for reference and verification.

No entries should be recorded in the cashbook which do not relate to cash.

The full receipts of each day should be deposited in the bank.

All canceled checks should be filed in numerical order.

Duplicate checks should always be covered by indemnity bonds.

Reconciliation should be made each month between cash or check reister and bank pass-book balances.

Permanent record of these reconciliations should be made.

Checks, sales slips, receipts, etc., should be numbered with a numbering machine. Any which are spoiled should be marked void and left in the book.

A regular system should be used for the acknowledgement of all cash sales, or miscellaneous cash items received.

The auditing of accounts also should receive more attention than is frequently the case. At least once a year an expert accountant should go over the books of the organization. To minimize the cost of this, small associations or circles can be formed by the organizations within a certain radius and a competent auditor can be engaged to do the auditing for all.

The strange part of farm organizations is that the members have never shown the sympathy toward each other that professional men show. Doctors treat the families of physicians free of cost; lawyers exchange courtesies and professional services; judges exchange benches when for any reason they are disqualified; merchant's associations have uniform systems of extending credits; bankers have special privileges in the financial world. But where is the farmer who shows special favors to or stands with his fellow farmer in business transactions? As a rule when favor is wanted the merchant, the banker or the professional friend is sought instead of a fellow farmer who is able to help.

Many a farmer is only 50 per cent efficient because he hasn't equipment enough. He thinks he is being economical by not buying necessary machinery when in fact he is only limiting his possibilities—and profits. A farmer ought to have all the equipment that he has the brain power to manage.

North Whittier Heights Citrus Nurseries

— HOME OF —

High Grade Citrus Trees of all Varieties at Reasonable Prices

20 Years Experience Growing Nursery Stock

Our nursery is located in a clean district, therefore our trees are absolutely free from insect pests.

These trees are excelled by none, for the reason that our stock of one-year-old buds are grown on new soil, and the greatest of care has been taken in the selection of buds which were taken from our own groves.

Lemons, Oranges and Grapefruit ⅝ and up, guaranteed to be true to name.

If it's Citrus Trees we can supply your demand.

Before buying write or call and inspect our stock.

Deciduous Fruits

RINGING AN UNSAFE STIMULUS TO FRUIT-BEARING

By F. H. Hall

FRUIT growers are often advised to drive rusty nails or mutilate trees in order to induce heavier bearing. We have always believed this could not lead to permanent increase of productiveness and must cause injury to fruit trees. We are glad to give of observations made at the New York state experiment station.

A Dangerous Remedy

Sluggish fruit trees sometimes so tax the patience of their owners that any measure would be adopted, however drastic, if it promised to spur the laggards into fruitfulness. For this reason the practice of ringing trees and plants has occasionally for a hundred years or more been recommended by plant physiologists and used by growers to induce or to increase fruit-bearing. The method has a theoretical chance for success; since the removal of a ring of bark from tree trunk or plant stem may be made with comparative safety at a certain time in the season and does not seriously interfere with the upward circulation through the active, growing, new wood, but does prevent the downward flow of the sap with the plant food formed in the leaves. Thus the food for the whole plant, including the lower stem and roots, is concentrated in the parts above the ring, and should and does serve as a stimulus to the formation and development of fruit buds. But is this stoppage of the normal circulation without danger to the plant, or is the good great enough to overbalance any such danger? Only careful experiments, continued for some time, can answer these queries satisfactorily; and such tests made at this station prove that the practice is generally either of too slight advantage to pay for itself or too dangerous to justify its use even when immediate results seem favorable.

Tests reported in Bulletin No. 151 of the station prove that ringing grape vines of certain varieties produces earlier ripening and better clusters, but that the vines suffer severely and do not become normally vigorous again for a long time, if ever. Bulletin No. 288 reports ringing of herbaceous plants, like tomatoes and chrysanthemums, as detrimental to the plants and productive of no compensating results in earlier or better fruits. The present bulletin records tests of ringing on apple, pear, plum and cherry trees, which indicate very limited advantage for the practice under any conditions and decided disadvantages in most cases, particularly with the stone fruits.

Ringing Apple Trees.

In June, 1910 a ring of bark one inch wide was removed from the trunk of each of 122 seedling apple trees then five years from planting. The bark was taken just above the surface of the ground and left in each case a clean surface of succulent, active cambium (new wood) which began immediately to repair the wound, so that by the end of the season all the rings were entirely covered with new, healthy bark. The trees were exceptionally strong and vigorous to start with and probably in better condition to withstand ringing than average orchard trees. None of them showed any set-back from the operation. During this season no effect on the fruit could be expected except some slight increase in size of the apples already set, but notes were taken on the crop as a check upon the effects of the ringing, if any, upon the number of trees fruiting and of fruits setting upon the individual trees in 1911. The results appear to favor ringing, since twice as many trees set fruit in 1911 as in 1910 (107 and 54, respectively), and the bearing trees produced 56 per cent of a full crop in 1911 as compared with 7 per cent in 1910. Of course, some of this increase was due to the advancing maturity of the trees, but it is evident that ringing these young, healthy, vigorous trees stimulated fruit production. The trees, however, never bore so good a crop again, even though subsequently ringed. In 1911, 27 of them were ringed a second time by removing inch strips directly above the former rings, again with quick healing and no apparent ill effects. But these trees ringed a second time averaged considerably less than half as good crops in 1912 as in 1911 and did no better than the trees ringed only in 1910.

In 1912 wider bands were removed from these same trees, the rings ranging from three to 21 inches on groups of four trees each. This severe treatment had no effect in stimulating fruit production, but an exhausting effect upon the trees, which increased with the width of the ring. One tree in both the three-inch-ring group and six-inch-ring group died after ringing, and from one to three trees in each of the other groups were lessened in vigor.

In 1911 Baldwin trees three years from setting were ringed, in groups of five trees each, beginning with two-inch strips and increasing the width of the band by two inches for each succeeding group until 20 inches was reached. At the same time the bark was removed from similar groups of trees in inch rings at varying distances from the ground, up to two feet. These young trees suffered severely from the ringing as new bark was not formed rapidly enough to cover the wound in any tree by the close of the season. The foliage dropped very early on all the trees, several died, all showed lack of vigor, and only 10 per cent of them started into growth the following season. Tests made the next year with trees four years set removing only one-inch rings, resulted about the same, as the ringed trees made less growth than similar trees not ringed, dropped their foliage early and made less growth, particularly of roots.

From these experiments it is clear that the first ringing of seedlings influenced fruitfulness favorably and resulted in a good setting of fruit without noticeable injury to the trees, but that subsequent ringing did not produce similar effects. With the Baldwins the results were all unfavorable to the practice.

Ringing Other Fruits

On young Bartlett pear trees ringed in 1912 by inch bands, the formation of new bark was not satisfactory, and before the end of the next season half of the ringed trees were dead and the others had made such poor growth that they were discarded. Digging showed the root systems to be very poorly developed.

Ringing is very seldom recommended for stone fruits as trees of this kind usually come into bearing earlier than apples and pears, are not as hardy, are less resistant to external injuries and are shorter lived. Nevertheless, some tests of the practice were made on both plums and cherries, with even less satisfactory results than with the pears. Few of the wounds healed perfectly, the foliage lost color and dropped early, growth was stunted, and of all the trees treated only one Montmorency cherry made any material growth the following season. Where any fruit set, as it did on a few of the plum trees, the ringing led to no increase in quantity and to some decline in quality.

Conclusions

The results obtained from these experiments are not favorable to ringing fruit trees as a general practice. Under some conditions, for a limited time, a more favorable outcome might be expected. Hardy, vigorous, young apple trees may readily undergo a single ringinig and be benefited thereby, but subsequent operations are injurious. Trees lacking vigor are often seriously injured by the practice. The deleterious effects of the treatment

IRRIGATION APPLIANCES

The 20th Century Method of Irrigation

As superior to old methods as the modern auto is to the ox cart.

Saves Water, Land and Labor.

Don't experiment—the best is the cheapest in the long run.

have generally been so marked upon various plant organs as to render the operation exceedingly hazardous. There seems to be no regular or systematic increase in fruit production. The gains do not offset the losses.

PEAR BLIGHT

Next to potato diseases pear blight is the great burning question now confronting the ranchers of California. It would not even be second in importance but that so many more of the people depend upon potatoes to keep the wolf from the door. I dare say that 95 per cent of the people consume potatoes, and many eat them seven days in the week and at each of the three meals. Pears are a luxury, but California pears are so admirable and the fruit has so limited a range that the grower who secures large annual crops of delicious Bartletts can certainly afford a first-class automobile.

There is just one impediment to success in pear culture, the terrible pear blight. This has been referred to so often that we hesitate to say more and would not except that such colossal losses are being sustained by a large number of the fruit growers, that so many are passive in an effort to control the pest and the further fact that the disease can be controlled. Entire pear orchards and orchards of whole communities have been known to be blighted and to die. Other orchardists are seemingly indifferent or are adopting measures entirely inadequate to cope with the disease. I know of men who have been fighting the plague persistently for three years, never flagging in winter or summer for even a day, and who have had bumper crops each season. These men have proved that success is possible, and their immense and phenomenal profits ought to make their example contagious. We now know positively that this disease is caused by a specific germ and that the germ is in the sac at disease locations. We also know that bird, insect, anything that pierces the diseased wood and then passes to healthy wood to penetrate the bark and cambium on the same and other trees will spread the blight.

Bees have been accused as the major agents of blight dispersion. It is probable that other insects, especially aphids (plant lice) are quite as active. It is thought that the exclusion of bees from the orchard will not reduce pear blight appreciably. We know that the disease lurks in blossoms, fruit, twigs, branches and roots. Wherever in any of these locations infested sap is conveyed, there the disease will very likely show.

It has been fully demonstrated that cutting out, absolute extirpation, is the only effective cure, but this disease is so insidious that many people will fail to do the proper cutting. Roots, trunks, branches, twigs, all must be gouged to ascertain if the infection is present, and when discovered every particle of diseased tissue must be cut away. Whole roots may be diseased and must be exorcised. The bark, cambium and outer sapwood may be harboring the fatal germs and they also must be cut away. In some cases the disease seems to penetrate deeper than has hitherto been supposed in the sapwood. To show how exacting this requirement is I have but to say that I know of a case where a very active experienced man worked three days on a single tree cutting away infested portions, yet the owner who has fought pear blight ten years set out a large area to pears the past season.

It is also imperative in fighting pear blight that the cutting instrument shall be disinfected after each cutting. Never cut a second time until the instrument is disinfected. Without doubt corrosive sublimate, bichloride of mercury, is decidedly the best disinfectant. Of course this will appear to be a great task, but pear blight is so common and orchard destruction so general that it is believed it will more than pay to take all possible pains to destroy these fatal germs.—A. J. Cook, State Commissioner of Horticulture.

PEAR BLIGHT

Noting accounts in the Cultivator of late of the trouble with pear trees blighting leads me to give my experience which may be helpful to others. In my orchard I had three Bartlett pear trees which were so badly covered with blight that in cutting off the parts affected scarcely anything was left but the trunks of the trees, and I was about to dig them up and put something else in their place when I read in Green's Fruit Grower an account of a man who cured his trees of blight by driving about a pound of nails into the body of the trees. I adopted this plan and since then my trees have put on a splendid growth, as clean and thrifty as any trees in the orchard, and last year were heavily laden with fine, healthy fruit. Later I planted the Lawrence and the Beurre d'Anjou and they began to blight. I cut pieces of rusty stovepipe with my snips and dug it in around the roots and the blight ceased and the trees are as bright and thrifty as any in the orchard, perfectly free from blight.

Since the above experience I have met several persons who have found the above remedy a perfect success, not only with pear but apple and other fruit trees as well.

Since writing the above my Bartlett and Lawrence pear trees have put on a bloom which makes them look like large, beautiful bouquets and are sending out new, thrifty shoots, showing as healthy a growth as one could desire.—Geo. M. Smith, Phoenix, Ariz.

* * * *

Notwithstanding the apparent success which Mr. Smith reports from the use of his nails and iron at the roots of the trees, we question very much whether this treatment will be effective in some districts where a serious infestation of pear blight prevails. We call attention to an article in another column, giving conclusions formed at the New York state experiment station regarding the effect of girdling or tree mutilation in order to secure increased crops.

RURAL IMPROVEMENT

"Rural Improvement, the Principles of Civic Art Applied to Rural Conditions, including Village Improvement and the Betterment of the Open Country," by Frank A. Waugh, Orange Judd Company, New York, price $1.25. The Cultivator will be glad to secure the book for its subscribers at this price, or, including a year's subscription to the Cultivator, at $2.05, postpaid.

This book touches upon the issues which are stirring rural districts. From the preface we quote:

"Big issues are stirring in the rural districts of America. The farming communities and the small towns dependent on them have reached a stage of genuine and confident prosperity. It is no longer a question with them whether they can live through the winter and pay the interest on the mortage. The main problem is not now how to make more money but how to live more comfortably. The way the farmers spend money for automoblies proves this.

"Better homes and better home surroundings are the matters of prime concern. Better schools, better playgrounds, better churches, better libraries, better roads are wanted—better cemeteries, even. In the main these are community problems to be solved by the cooperative action of the whole neighborhood. Cooperation has been talked of as the coming remedy for all the farmer's difficulties, but the word has been given too narrow a meaning and application. The neighborhood can accomplish more by cooperating to own a grange hall, or the boys can do better cooperating to maintain a baseball league than the farmers can cooperating to buy fertilizer 25 cents under market price. And the best place to learn how to cooperate is in the care of public property, such as parks, commons, playgrounds, schools and roads which we own in common."

These above points are covered in the 13 chapters making up this book. These chapters touch, among other things, the principles underlying road improvement, roads and streets, roadside trees, civic centers, home gardens, farm planning, community planning, architecture, problems and programs of interest to rural people. The book is made up of 266 pages. It is well illustrated and has an excellent index.

Cultivate with a
"Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator. The upkeep on the two tracks on each Baby Creeper will be insured for $25.00 per annum.

CELERY CULTURE

Written for California Cultivator
By D. F. Reichard

CALIFORNIA has become famous as a celery growing state. The celery industry has developed because of the fact that our celery matures and is ready for shipping during the winter months, in this way giving the consumer fresh celery instead of the cold storage product of Eastern sources.

The peat lands of Orange County have, up to the last few years, been the main source of supply, but the ravages of disease—notably blight—have reduced the product of this district to about one-fifth of what it was. This shortage has been made up by growing celery on rich river bottom lands in Los Angeles County and on some of the islands in the upper San Joaquin Valley.

In each district the method of growing celery differs somewhat but the following directions will apply in general:

The seed bed should be of soil that is naturally moist or such as can be sub-irrigated. The piece intended for seed-bed should be deeply plowed and thoroughly worked down with a harrow, and just before seeding with a garden rake. On peat lands the seed-beds are made four or five feet wide, while on lighter land the seedlings are started in rows, one on each side of a low ridge. It takes from three to five weeks for celery seed to germinate and three to four months for it to attain the proper size for transplanting to the field.

When the tops have grown to three inches or over they should be clipped back about one half, and when they get three or four inches again clip them back. From this age on they are ready to transplant. Seed are sown, according to the district, from early in February till late in May. One pound of seed is enough for one-quarter acre of seedbed or four acres of set plants. Keep the seed bed free from weeds.

In preparing the field for the plants the land must be plowed to at least 12 inches and thoroughly worked down. On the lighter river bottom lands ten to 20 tons of stable manure to the acre is plowed under; besides this 500 to 1000 pounds of commercial fertilizer per acre is used while the crop is growing. This heavy fertilization is not necessary on the better peat lands.

In the peat lands the plants are set six inches apart in trenches six inches deep about four feet apart. Between the rows thorough cultivation should be kept up but care should be taken not to fill the trenches until the plants have made a growth of six to eight inches, when the trench should be gradually filled. When the plants are a foot high the earth is drawn up to them. This should be done very carefully when the tops are dry. If the dirt is brought up too high it makes the plants weak and spindly.

On the higher soil of the river bottoms celery is planted on both sides of the low ridges about two feet apart. In this way the rows on the ridge are about eight inches apart and there is about 18 inches between the inside rows. By this method the plants are so close that blanching is accomplished without "banking up." In garden culture the blanching is more practically done by tying papers or bags around the stock a couple of weeks before the celery is ready to cut.

In large fields celery is harvested with a "U" shaped cutter attached to a sulky plow frame, drawn under the banked celery, cutting off the roots and loosening the plants. The outer leaves or stalks are trimmed off and the roots squared preparatory to packing into crates ready for shipment. These crates are 22 by 24 inches and hold five to eight dozen heads. Where celery is not banked up harvesting is done with butcher or large pruning knives.

An acre produces about 15,000 heads of celery valued at approximately $300 at a cost close to $100.

The Golden Self-Blanching is the variety used exclusively for shipping while the White Plume is a nicer variety for the home garden.

Celery blight is the prinicpal disease but this can be controlled by spraying the plants with Bordeaux mixture as soon as signs of the disease appear.

POTATOES FOR STOCK FEED

The heavy production and the low price of potatoes have directed attention to their value for stock feed. Hitherto this subject has not received much attention in this country because under ordinary conditions other feeds are undoubtedly much cheaper and better. Some estimate that even at 15 cents a bushel it is more expensive to feed potatoes to stock than it is to feed silage, while on the other hand it is scarcely probable that the farmer can raise potatoes for much less than 30 cents a bushel. Their actual value for feed depends upon many factors, but it is better to make some use of the potatoes on hand rather than let them rot.

In Germany where the potato crop is proportionately far greater than in this country, the question has been more thoroughly studied. The tubers may be used for feeding cows, horses, sheep and pigs, but they are best adapted for pigs. To secure the best results with swine the potatoes should first be cooked and then made into a thick mush mixed with the corn meal or other grain. If skim milk is added the value of the feed is much increased.

In feeding potatoes to dairy cows from one-half peck to one peck should be fed to start with. They should be given raw and should be run through a root cutter to prevent choking the cows. An excessive feed of potatoes to a dairy cow is liable to cause scours, but as much as one-half bushel per cow per day has been fed without bad results. In addition to the nutrients contained potatoes give succulence to a ration, a factor of importance in feeding dairy cows.

CROPS NOT AFFECTED BY MOON

Scientists are now convinced that the moon has no more influence on crops than it has upon the temperature or the amount of rain or the winds, or any other weather element. The growth of plants depends upon the amount of food in the soil and in the air that is available for them and upon temperature, light and moisture. The moon obviously does not affect the character of the soil in any way, neither does it affect the composition of the atmosphere. The only remaining way in which it could influence plant growth, therefore, is by its light. Recent experiments, however, show that full daylight is about 600,000 times brighter than full moonlight, yet when a plant gets 1-100th part of normal daylight it thrives little better than in absolute darkness. If 1-100th part of normal daylight is thus too little to stimulate a plant, it seems quite certain that a 600,000th part cannot have any effect at all. It is therefore a mere waste of time to think about the moon in connection with the planting of crops. The moon, say the scientists, has nothing more to do with this than it has to do with the building of fences, the time for killing hogs, or any other of the innumerable things over which it was once supposed to exert a strong influence.

It requires as much skill to properly market garden stuff as it does to grow it. Always give your produce the stamp of an honest, careful dealer. Offer for sale only the carefully selected best Better throw inferior stuff away or feed it to the chickens and pigs. Pack and display your goods so that they present a pleasing and appetizing appearance. Ship all very perishable products by express and find out exactly when they will be delivered.

Farm Bureaus

ANNOUNCEMENTS of farm bureau meetings for June are given below. Others will appear in next week's issue. We are glad also to give news notes of work accomplished and in contemplation in the various sections.

Ventura County, William B. Parker, Adviser, Ventura

Ventura Avenue, June 4.
Fillmore, June 7.
Oxnard, June 9.
Camarillo, June 11.
Nordhoff, June 14.
Saticoy, June 16.
Moorpark, June 17.
Somis, June 21.
Santa Paula, June 22.
Simi, June 23.
Mound, June 29.

Glenn County, W. H. Heileman, Adviser, Willows

Work in Hamilton district, June 3 and 4.

Monthly directors' meeting, June 5.

Ord center, June 7 and 8. Night meeting, June 8.

Bayliss center, June 10 and 11. Night meeting, June 11.

Codora center, June 14 and 15. Night meeting, June 15.

Larkin center, June 17 and 18. Night meeting, June 18.

Orland center, June 21 and 22. Night meeting, June 22.

Jacinto center, June 24 and 25. Night meeting, June 25.

Newville district, June 28 and 29.

Elk Creek district, July 1 and 2.

Wednesday of each week will be given to boys' agricultural club work and special investigations. Saturday of each week wil be given to office matters and special work.

The Ord and Bayliss centers will hold Fourth of July celebration on the Sacramento River. The Codora and Larkin centers will also join each other in a celebration on the Sacramento River adjacent to these centers. The centers will control concessions and turn proceeds into the county farm bureau.

The county-wide work in the farm bureau during the month of June will center largely on the organization of the dairy and hog raising industries of the county.

Napa County, H. J. Baade, Adviser, Napa

Coombsville, June 1.
Browns Valley, June 2.
Salvador, June 5.
Fly District, June 9.
Calistoga, June 10.
Soscol, June 11.

Soda Canyon, Napa; Directors' Meeting, June 12.

Carneros, June 14.

Rutherford with Professor Herms, June 15.

St. Helena, June 16.
Wooden Valley, June 19.
Rutherford, June 21.
Berryessa, June 23.
Pope Valley, June 25.
Mt. George, June 26.

The subject for discussion this month at the various farm center meetings will be "The House Fly and Its Control."

The Rutherford farm center has just completed the installation of electric lights in the local school house to show their appreciation for the building which is provided for them and also to furnish better light.

We are at present in the midst of an attack of green aphids which are tending to destroy the prune crop in certain localities. This problem we are handling very successfully by means of an emulsion spray.

We are now planning on the establishment of a number of demonstrations to show that the heavy adobe soils of Napa County will work properly if the excess water is removed.

The date for the Napa County farm bureau day has been set, temporarily, for September 13. Arrangements are under way to make this one of the most profitable events of the year to the farmers.

Maricopa County, Adviser, Jas. A. Armstrong, Phoenix, Arizona

Liberty, June 2.

South Side Farm Improvement Association, June 8.

Lehi, June 10.

Gilbert Commercial Club, June 18.

We have succeeded in signing up the initial 600 cows for our cow testing association in this place on the contract below. We expect to start operations just as quickly as we can find a suitable man to fill this position.

The harvester ant extermination campaign is proving very popular with the ranchers. There are approximately 8000 acres of land infested with harvester ants which will be under treatment during the coming season under the special directions of this office. The extermination work will begin about the first week in June and will be conducted throughout the summer. It is our hope that at the end of the season these 8000 acres will be practically free from the ravages of the harvester ant which will mean a very great saving to the ranchers in doing their work. The cost of the extermination of this pest will average less than one year's damage done by the ants on the area treated.

Cow-testing Association Contract—Whereas, the agricultural extension service of the University of Arizona college of agriculture has arranged for the services of an expert cow tester to assist farmers in ascertaining the relative merits of their cows and the economic production of dairy products; and

Whereas, the agricultural extension service agrees, from monthly tests made by the tester of the agricultural extension service, to furnish each farmer with a record of the individual performance of each animal subscribed, and to advise the farmer in regard to economical feeding, care and improvement of his herd; and

Whereas, I ————, am desirous of cooperating with the agricultural extension service for the purpose above stated;

Now, therefore, in consideration of my receiving the services above mentioned, I agree and promise to keep each month a seven-day record of cows on test, and to take a composite sample of the milk, the composite sample to begin two days before the tester arrives at my ranch, and to pay the tester 15 cents per month for each cow tested, payment to be made on completion of test. I furthermore agree to keep as many cows on test during the year as I start with and to pay for at least that number; to pay 15 cents per month for each additional cow; and I agree to furnish board and lodging for the expert employed as tester for at least one day in each month and over Sunday if his regular course brings him to my home on Saturday; and to convey him to the next place of work.

This contract is not binding unless the said agricultural extension service secures a sufficient number of cows to warrant starting operations.

The term of this agreement shall be one year from the time testing begins.—Signed....., Date..... Witnesses, ...For Association

Humboldt County, Adviser, A. H. Christiansen, Eureka

The Verdict

— convincingly and overwhelmingly for Goodrich

The B. F. Goodrich Company *alone* through the daily press of *January 31st* gave to the consuming public the *most sweeping reduction* ever made in tire prices. This established the *only genuine Fair-List* in existence on non-skid tires today.

Goodrich prices were dated February 1st, in ordinary course. Other tires were reduced in prices *a few days later* and the reduction *dated back* to February 1st.

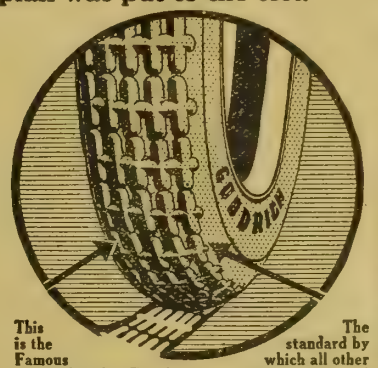
Every *real* price-reduction on tires has followed the lead of Goodrich.

We knew we were right. We knew that the dealers would know it as soon as our plan was put to the test.

Hundreds of dealers who have been dividing their business have notified us that they have decided to sell Goodrich "Fair-Listed" Tires exclusively.

Tire *Standards* have from the first been set by Goodrich Products.

Goodrich Safety Tread Tires are today, as they have always been the *Standard* by which the merits of *all* Non-Skid Tires are measured.



This is the Famous Goodrich Safety Tread — **The standard by which all other non-skids are judged**

Only 5% PLUS for the Best Non-Skid

Goodrich Safety Treads give more mileage than our own (or any other) smooth tread tires, at only the 5% more cost to you. Note comparative table of prices on Non-Skid Tires showing other brands costing from 10% to 30% more than Safety Treads

Size	Goodrich Safety Tread	OTHER MAKES "A"	"B"	"C"	"D"
30x3	$ 9.45	$10.55	$10.95	$16.35	$18.10
30x3½	12.20	13.35	14.20	21.70	23.60
32x3½	14.00	15.40	16.30	22.85	25.30
34x4	20.35	22.30	23.80	31.15	33.55
36x4½	28.70	32.15	33.60	41.85	41.40
37x5	33.90	39.80	41.80	49.85	52.05

Goodrich "Fair-Listed" Prices constitute the *standard* by which the prices of other tires *must* be judged.

Goodrich *Leadership* is more firmly established today than it has ever been in the past.

Goodrich Tires are *better* this year than we have ever been able to make them before.

You *know* the superiority of Goodrich Tires. You also know about Goodrich "Fair-Listed" Prices — the prices that have knocked out the padding for the *Benefit of Tire Buyers.*

You know, too, that the verdict is overwhelmingly in faver of Goodrich Safety Tread Tires.

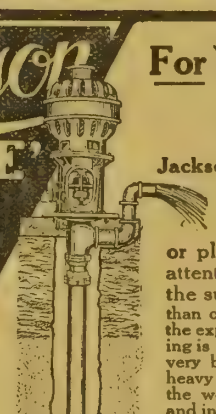
Write for Catalog No. 48 F



A Better Make Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

General Agriculture

OVERCOMING WHITE ALKALI

REPLYING to the question of a farmer near Yuma concerning the best method of getting rid of white alkali, Professor Stanley F. Morse, superintendent of agricultural extension service of the University of Arizona agricultural experiment station, writes:

"In order to overcome white alkali, I would suggest to you the following procedure: Throw up rather high borders about two rods apart and flood with a large quantity of water; if the fall in the land is too great, plow up cross borders in order to hold the water on the land. If the soil is of a tight, heavy nature, it would be well to use a subsoil plow previous to leveling the land and throwing up borders. It would be desirable to use a second heavy irrigation if time and water are plentiful. As soon as the soil is dry enough so that a team can get on it without injuring its texture, plow the land and harrow it thoroughly, making a fine seedbed and a good surface mulch. Then immediately plant one of the grain sorghums in rows 36 to 42 inches apart. Keep the soil loose by cultivation, not only after every irrigation and every shower, but also whenever it may become at all compacted by the baking of the sun. Feterita would probably be an excellent crop for this purpose, and if you had a number of hogs it would be a good idea to turn them into this feterita and let them pasture it down or else harvest only the heads and leave considerable residue on the land which could be incorporated with the soil. Kaffir corn or milo maize could also be used. After the grain sorghum was harvested you could sow wheat or barley at the rate of a bushel and a half per acre together with about 30 pounds of sour clover. It would be a good plan to pasture this crop also more or less throughout the winter; in the spring allow it to make as large a growth as possible to be turned under. Another grain sorghum crop might well follow the next summer. In conjunction with this treatment I think it would be desirable, if you had any manure or straw, to haul this material out on to the land and spread it thickly on the worst spots. About the third year, if you so desired, cotton could probably be planted on this land. In every instance, before planting the crop, a very heavy flooding with water should be given. I feel sure that a persistent following of this procedure would eventually eradicate the alkali and make this land extremely productive. The foregoing recommendations are based upon my own observations of successful farm practice in subduing alkali in Arizona.

SQUIRREL ORDINANCE

Ventura County is to the fore with a thorough-going ordinance which aims to abate the squirrel nuisance. It provides that it shall be the duty of every person owning or occupying land situated in that county to keep such land clean of squirrels, and any failure so to do shall be deemed sufficient cause for the public, through its proper agent, to enter upon the land and abate such nuisance by destroying the squirrels; that all costs and expenses so incurred be declared a lien upon the land, said lien to remain in effect until payment or sale has been made to satisfy costs and expenses.

A squirrel inspector is appointed at a salary of five dollars per day, who shall work under the orders of the county supervisors and in conjunction with the directors of farm bureau centers of the various districts.

Any occupant of land who shall fail to clean such land of the squirrel pest shall be served with a notice and if the nuisance is not abated the inspector has the power to rid the place of squirrels and the cost thereof becomes a lien upon the property.

THE CALIFORNIA FARMER AND THE AUTOMOBILE

"Largely through the influence of Director Page hostile sentiment toward the automobile in the rural sections is gradually giving place to a more friendly attitude," says a conservative weekly newspaper published in the East. Just who is "Director Page," this man of influence, does not concern us now. What we of California are interested in is the "hostile sentiment toward the automobile in the rural sections."

We have noticed that in California. The California farmer is the most hostile thing toward automobiles that we have ever heard of. He won't have a poor car around the place. The language that he will use when a neighbor buys an old boat that won't make two knots an hour along the state highway is quite painful to hear. Nor is there any one more hostile to the lavender and old lace of a stylish limousine—that is, for ordinary farm purposes. Of course, if mother and the girls want a car that has an interior finish like a French salon, that is all right; but the rural dweller in California puts his foot down like a ton of brick when it is suggested that he buy a hifalutin' machine to take the butter fat to the creamery.

Not for Joe. No, siree. If you want to see a hostile that will make Sitting Bull look like a blanket weaver in the sun, just hint that there is a better car than the farmer himself is driving.

Of course, there are automobiles toward which rural California is not hostile. Those are the cars owned by the rural Californian, and they include all known makes. The California farmer is the greatest automobile buyer in the world. He has money to invest and he invests rationally—but, my, isn't he hostile against the car he doesn't like. —San Francisco Call.

DIGGING DITCHES WITH DYNAMITE

The following is quoted from Farm Engineering and will probably be of interest to many.

Dynamiting a Side Hill Ditch

The writer once had charge of the work of making a ditch along a steep hillside, and as there were boulders, stumps and trees in the line of the ditch, besides stretches of solid sandstone and other places where there were rocks imbedded in the hard, dry earth, we had a chance to try out ditching with dynamite pretty thoroughly.

We could not load the holes heavy enough to clean the ditch as most of the material was needed to strengthen the lower side. Holes were spaced three feet apart and drilled or burleyed down to grade and loaded with from one to two sticks of 20 per cent dynamite excepting in the hardest sandstone where 40 per cent was used.

We used a battery to fire with and shot from 70 to 90 feet at a time, after which the dirt which was not thrown out was placed on the lower side of the ditch.

Had this been on comparatively level ground a double row of holes and heavier loading would have cleaned the ditch. I also saw a pond made three, and in places, four feet deeper, by exploding electrically about 30 pounds of dynamite in one pound shots, spaced about four feet each way and three feet deep.

Practically all the earth above the bottom of the holes was lifted high in the air, but unfortunately the high wind, which we expected would help to carry the dirt to one side, lulled about the time we were ready to shoot and some of it fell back in the hole, but the loosened earth was easily removed.

Three ways of increasing profit are open to every farmer: increasing production; cutting the cost of production, and better marketing.

Irrigation Forestry

THE GREAT SACRAMENTO VALLEY

NO PHASE in the history of California is more striking and interesting than the economic and social changes which are now affecting the Sacramento Valley. These changes cover the whole field of human activity, and yet in a peculiar sense the control and use of water are vital factors which have a greater effect on the development of the valley than any of the great industries which have shown wonderful expansion throughout the whole country since the civil war. Each step in the mastery of water adds impetus to the industry of agriculture, which after all is the foundation of prosperity.

The control of rivers for navigation and flood protection, the drainage of swamp lands, the harnessing of mountain streams for the production of electric power, and the use of both surface and underground water for irrigation and domestic purposes present problems that involve all the phases of hydraulic engineering. The solution of these problems is being accomplished with amazing rapidity, largely by private interests working under wise laws and under effective supervision and control by state and federal bodies.

The large irrigable area in the Sacramento Valley and the extensive use of ground water for domestic purposes, public supplies and irrigation led the United States geological survey, in cooperation with the California state department of engineering, to undertake an investigation. A preliminary report by Kirk Bryan has just been issued by the federal survey as Water-Supply Paper 375-A. The Sacramento Valley contains 15 per cent of the agricultural land of the state. Only 3.5 per cent of the area was irrigated in 1912, when the investigation was begun, but it is estimated that at least 75 per cent, or 21 times that area, will ultimately be brought under water. These large possibilities have led to a rapid increase in the number of irrigation projects and an influx of men and capital from other parts of California to derive profit from the development of the land, their expectation being that the permanent future population will come from the eastern states or from Europe.

Because of a mild climate, a concentrated winter rainfall and a shallow water table, many field crops and deep-rooted plants thrive in this valley without irrigation. Water is not a necessity for crop growing, but it makes possible much larger yields, the cultivation of crops with a higher return to the acre, and the cultivation of certain lands otherwise chiefly valuable for grazing. Such advantages have appealed but lightly to owners of large holdings, who bought their land at a low price, perhaps $1.25 an acre, but the crowding in of homeseekers from the East, the diminishing profits of grain farming and the great increase in land values have combined to bring about the subdivision and sale of many large parcels of land. To the purchasers of such tracts the advantages of irrigation appeal more strongly.

The report describes the water-bearing formations in the Sacramento Valley, the origin and movements of ground water, ground-water development, well and pumping problems and methods of irrigation with well water. A copy may be obtained free on application to the Director of the Geological Survey, Washington, D. C.

The geological survey has also been engaged for a number of years in topographically mapping the Sacramento Valley in cooperation with the state, the work now being nearly completed and the maps published. An index of these maps, showing the areas covered, prices, etc., will be furnished free of cost by the Director of the Survey.

When a stream is discharging one cubic foot of water every second of time there is a second foot flow.

HOW MUCH WATER SHALL WE USE THIS YEAR?

Exhaustive experiments have been made in the United States to determine how much water should be used to produce the different agricultural crops. This is of course a big question, and the answer depends upon the kind of crop, soil, climate, irrigator, etc.

Ask an old timer how much water to put on a field and he will usually answer, "As much as you can get." We must also admit that within ordinary limits the more water an irrigator applies the greater will be the yield, but this does not mean a larger net return will come to the farmer.

In many cases the farmer's water supply is regulated by the number of shares of ditch stock owned, and if he is shrewd he can figure about how much water will come to him during the irrigating season.

Suppose he figured that he will have available 25 acre feet of water for sugar beets, that the contract price for these beets is $5.00 per ton, and that it costs him $60 an acre to produce these beets, including interest on investment, delivery, etc.

The question for him to settle is this: How many acres shall I plant?

Suppose now he plants 10 acres. The water available is 2½ acre feet per acre. With a good season, good ground and good care, experiments show a yield of 21 tons per acre, or a total of 210 tons at $5.00 equals $1050, less $600 (cost of producing), leaves a net profit of $450.

Again, suppose he plants 20 acres, uses the 25 acre feet of water on that land. Experiments show that with above conditions a yield of 19.5 tons per acre, or 390 tons total yeld, at $5.00 gives $1950, less $1200 (for producing), leaves a profit of $750.

Again let him plant 30 acres and use the 25 acre feet of water thereon. Experiments show a yield of 18.6 tons per acre or 558 tons at $5.00 gives $2790, less $1800 (for producing), gives $990 profit.

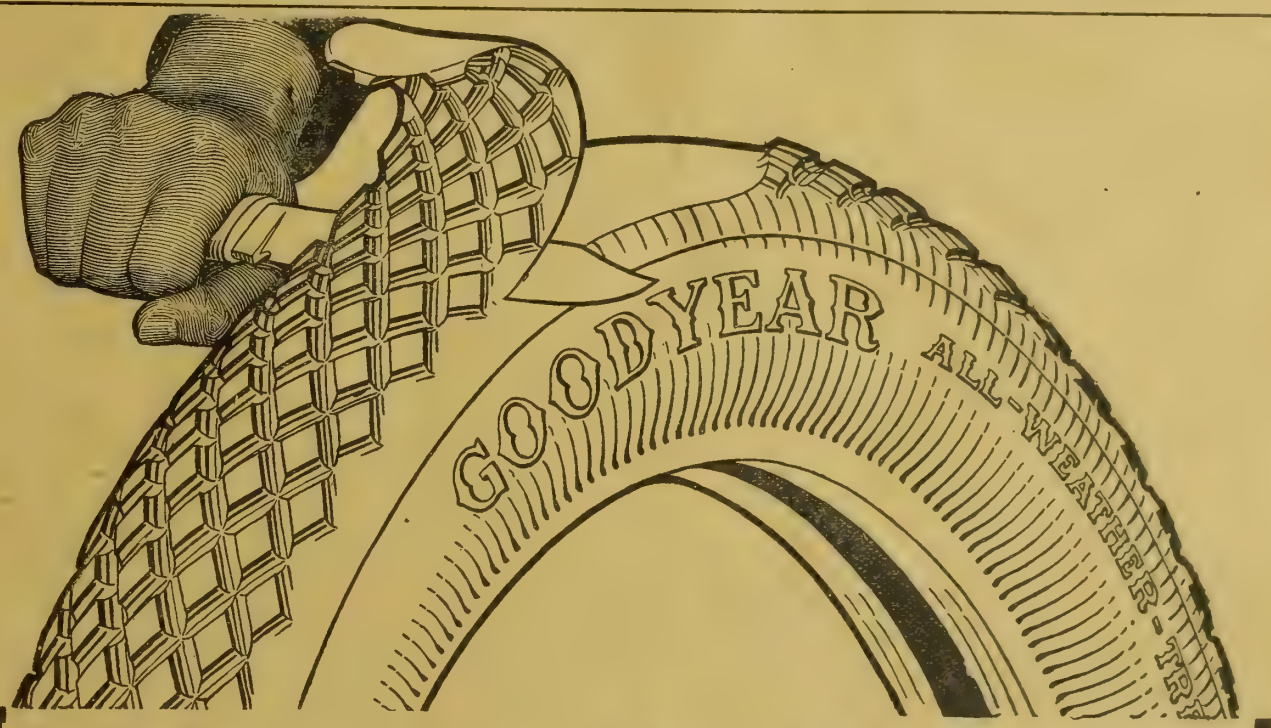
Again let him plant 40 acres under the above conditions. Experiments show a yeld of 16.3 tons per acre, or 652 tons total at $5.00 equals $3260, less $2400 (for producing), gives $860 profit.

He will find the 30 acre field then most profitable for the water available.—E. B. House, Colorado Agricultural College.

EMPLOY FARM EXPERT

B. Terry White, secretary of the Dinuba chamber of commerce, writes that the chamber has secured a series of lectures from professors in the agricultural college which are to be delivered monthly. In addition, it is being urged that the Alta Irrigation District, which serves Reedley, Sultana, Orosi and Traver, employ a farm adviser for that district, the expense to be met as other district expenses are. This idea is meeting with enthusiastic support on the part of many served by the district.

One acre contains 160 square rods, 4840 square yards, 43,560 square feet. The side of a square must measure as follows to contain: Ten acres, 660 feet; one acre, 208.71; half acre, 147.58; third acre, 120.50; fourth acre, 104.38; eighth acre, 73.79.



Suppose We Pared This Tire

Suppose this All-Weather tread—which is now double-thick—were pared to the thinness of the usual anti-skid. Do you think that the grips would endure and the tread endure as now? Or would it resist puncture like this matchless tread?

Suppose we used—as some do—one less ply of fabric. Suppose the whole tire were made lighter. Could the tire stand use or misuse as Goodyear tires do now?

Suppose we omitted our other exclusive features:

Our No-Rim-Cut feature—

Our "On-Air" cure to save blowouts—

Our rubber rivets to combat loose treads—

Our 126-piano-wire base for security.

All others do omit them. All of them are costly. One of them—our "On-Air" cure—costs us $450,000 yearly.

But could Goodyear Fortified Tires retain top place if we did not give those extras?

We're Adding Betterments

Instead of that, we are all the time adding betterments. We spend on one department $100,000 yearly to seek out new improvements.

Our All-Weather tread—always double-thick—has been made still thicker on some sizes.

We have added an average of 14 per cent to the thickness of our Inner Tubes.

And we are making our own fabric to secure an extra strength.

Price Reductions

Yet we have made big price reductions three times in two years. Our last—on February 1st—brought the total to 45 per cent. That is largely due to multiplied output.

Today you are getting in Goodyear Fortified Tires the best value ever known in tire making.

It is due to yourself that you get these tires. They are saving millions of dollars and millions of troubles to motor car owners each year. And men know this. Last year they bought about one Goodyear tire for every car in use.

Join these contented tire users. Any dealer will supply you.

GOODYEAR
AKRON, OHIO

Fortified Tires

Fortified Against
- Rim-Cuts—by our No-Rim-Cut feature.
- Blowouts—by our "On-Air" cure.
- Loose Treads—by many rubber rivets.
- Insecurity—by 126 braided piano wires.
- Punctures and Skidding—by our double-thick All-Weather tread.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

INSECTS OF CALIFORNIA

Another week we will give review of "Injurious and Beneficial Insects of California," written by E. O. Essig and printed by the state horticultural commission, but we must give the information to our subscribers that it is a most valuable book and may be had by making request to State Horticultural Commissioner Cook at Sacramento. It is a book of nearly 550 pages, giving a list of all the known insects of California. There are hundreds of illustrations, and the book is put up in a way to make it invaluable to both the specialist and the practical farmer.

LIBERTY BELL COMING

California in general, and San Francisco and San Diego in particular, have been working to secure the Liberty Bell in order to give the youth of California an opportunity of seeing the bell which announced the Declaration of Independence. They have finally succeeded, and the mayor and city council of Philadelphia have promised that the bell will leave Philadelphia, escorted by many officials of that state, on July 5. It will be exhibited first at San Francisco, and on its way to the San Diego exposition will be exhibited at Los Angeles. Organizations of thousands of school children will be formed which will act as an honorary guard and sing the national songs. California certainly will give a royal welcome to the old bell.

FLAG DAY

June 14 is Flag Day. We doubt not it will be observed this year as never before. We do not think there ever was a time when there was a more patriotic feeling over this country than at the present. This is perhaps because nearly all the rest of the world is at war, and in their war operations have more or less transgressed the rights of this country. Fortunately, our patriotism is manifested quietly and jingoism is not in the foreground. As one has stated it, the sinking of the Lusitania has taken the hyphen out of Americanism. The German-American, the British-American, the Belgian-American, who were so prominent early in the war, have largely merged into patriotic Americans. The American flag should float over every home on June 14, 1915. This is the 138th anniversary of the adoption of the flag of the United States of America.

MILLIONS IN MISTAKES

The management of the extension service of the University of Arizona estimates that mistakes in that state cost the farmers in excess of $1,500,000 annually. "It is our observation that many of these farmers, especially the new settlers, are making every year little mistakes in planting the wrong kinds of crops at the wrong time of year in the wrong way and using incorrect methods of irrigation and cultivation. These mistakes frequently result in considerable losses of time and money and yet are very easily preventable."

We doubt not the figures given are conservative; we are sure the mistakes made in California cause losses vastly greater. It is human to err, and we suppose this failing of humanity will obtain to the end of time. Meanwhile, it is well for our farmers to reduce those mistakes to the minimum. Our universities, farm advisers, horticultural commissions and farm papers are all working to the end of reducing these mistakes to the minimum. The farmer who is succeeding is using every one of these means to reduce the mistakes.

PAN-AMERICAN

This is the week of the Pan-American congress which is being held in Washington, D. C. This conference should be of great importance to the Americas, both north and south, and should be particularly important to the Pacific Coast. European attention is now largely self-centered, and if America takes advantage of this opportunity to plan its own affairs and make shipping arrangements whereby Americans may deal with each other without the invariable middleman, we believe it will be for the benefit of all.

Speaking of prosperity, by the way, when the conflict started in August this country owed to Europe in excess of $200,000,000. Orders for war supplies and breadstuffs have changed this indebtedness of $200,000,000 to a credit of over $600,000,000 now owed by other countries to America. It is estimated that by June 30 this surplus credited to this country will be in excess of $1,000,000,000. The government crop reports all show that our crop and nearly all other crops will be exceedingly large. Last year's crop of wheat was immense; this year's will be even greater and will reach a total in excess of 700,000,000 bushels.

Another saving which will keep much gold in this country, and which it is stated will aggregate at least $1,000,000 daily, is the inability of the American tourist to travel in Europe.

Incidentally, California is having expositions, all kinds of national conventions and the best climate on earth.

THE WEATHER

California's climate is perfect. Of course, there are widely separated occasions when we get a streak different from anything we have had before. Fortunately, we are now being given our regular variety—fortunately, because the chief of the weather prevailing over the United States is making a visit to California expositions and California climate. Dr. Charles F. Marvin, who has been with the weather bureau for nearly a third of a century, is making his initial visit to the coast and getting in touch with the needs of California. In Southern California he was shown a little strip of the citrus belt, where the information furnished by the weather bureau has probably saved more property than in any similar agricultural area in the world. His visit was all too short to present to him all the details of California agriculture and all the information as to the advantage which his bureau can be to California agriculture, but Dr. Marvin has wonderful powers of observation, and we doubt not our service will be greatly benefited by his visit. Another week the Cultivator will give some of the details of the weather bureau's work in this state.

COOPERATION OVERWORKED

"Recently I heard a good fruit man say, 'The word cooperation has been overworked.' I do not think so. It has won popular confidence to such extent that even the competitors of the Florida Citrus Exchange are using it to prevent cooperation among us.

"I have recently visited New York, Philadelphia and Washington, and looked into the citrus fruit condition there. In each of these cities practically every car of California fruit is handled by one man and in one place. That is cooperation.

"In each of these cities Florida fruit is handled by many men through many channels, and so not only is in competition with California fruit but is in competition with itself."

The above is from an address to fruit growers of Florida by President Ross of the Florida Citrus Fruit Exchange. Florida growers have not been organized as long as have those of California, and it is not to be wondered at that in the present time of poor marketing conditions there should be great unrest within the ranks of the exchange. The cooperators of California are watching with great interest conditions in Florida, for the exchange there received most of its inspiration from the success of the California growers. Besides we believe that fruit marketing conditions will be better by the Florida growers remaining within cooperating ranks. As President Ross says, those who are not cooperating are putting their fruit in competition with their neighbors'. It is unthinkable that California citrus growers should ever dispense with their organization, but if there are those within its ranks who are not fully satisfied with present conditions, they may well look at Florida's experience for an indication of what will occur should the greatest cooperative organization of this state be seriously weakened.

Agricultural Notes

The United States is the best customer for Greek olives.

Texas onion shipments will probably total 3500 carloads. More attention than ever before is being paid to packing and grading.

The demand for American agricultural machinery in Canada has fallen off seriously this year, presumably because of war conditions.

Eggs arriving in San Francisco from China during 1914 numbered 1,640,385 dozen, worth $193,147; also $63,622 worth of preserved eggs.

The importance of the cattle and sheep business of Australia can be seen at a glance. The country feeds approximately 11,500,000 head of cattle and 83,250,000 of sheep under normal conditions.

It is interesting to note to what extent so far the war has prejudicially affected the oversea trade of Australia. We learn that imports have shrunk by some $55,000,000 in value, whereas exports have declined by some $120,000,000 since July last, or a falling off of $175,000,000 in aggregate trade.

The shipment of wheat, flour and a large number of other agricultural products and commodities from Canada to the United States has been prohibited, it was officially announced recently except where such shipments are intended solely for domestic consumption in the United States and not for reshipment abroad.

The longest flagstaff produced in British Columbia will be forwarded to Great Britain as a present from the provincial government and will be place in the Kew Botanical Gardens, a few miles out from London. The tree from which it was made was a perfect specimen of fir pine, and the staff, which is 216 feet long, is without flaw or defect.

The Rogers Pass five-mile tunnel under the Selkirk Range, now under construction on the Canadian Pacific route, will be the longest railway tunnel on the American continent, the longest at present being the four and three-fourths-mile Hoosac tunnel on the New York Central. The $10,000,000 Rogers Pass tunnel will shorten the route four miles and materially reduce the grade.

Eighty-three head of Corriedale sheep representing the first importation made by the bureau of animal industry of the United States department of agriculture from New Zealand, left Woodland, California, recently for Wyoming where the government will use them in experimental work. They have been held on a Woodland ranch for several months to become acclimated.

American canners are taking an interest in the rapidly growing imports of tomato paste, or sauce, from Italy, and it is not unlikely that efforts will soon be made to keep at least a part of this business at home. The total imports of the paste in 1913 were valued at $2,801,974 and weighed approximately 13,000 tons. The tomato product imported into this country from Italy is made by crushing the tomatoes, straining out the skins and seeds and reducing the pulp to about one fourth its original volume by evaporation in vacuum boilers, although for special purposes it is reduced to as little as one-twelfth. It is used in Italy in a great many dishes, perhaps the most familiar of which to Americans is spaghetti.

Agricultural News Notes of the Pacific Coast

Northern California

Plans are on foot to install a cannery at Orland.

The California Viticultural Association met in San Francisco Friday, May 21.

Articles of incorporation have been filed for the California Hop Growers' Association.

The National Lumbermens' Association held a convention at San Francisco May 13.

Farm Adviser Searls of Yolo County reports shot hole fungus prevalent in the orchards of that county.

President Robinson of Alameda County's farm bureau is urging farmers to enter exhibits at the Panama Pacific.

Horticultural Commissioner Stabler of Sutter County reports mildew very prevalent in the vineyards owing to the damp weather.

Two hundred and fifty thousand pounds of butter were shipped on one boat which left San Francisco last week for Australia.

Heavy spring rains have caused the Sacramento River to rise to the 24-foot, three inch mark, which is the highest since May, 1892.

Modoc County reports 60 per cent larger acreage planted to wheat this year than last. The greatest increase is in Goose Lake Valley.

All measures passed by the recent session of the legislature will go into effect on Saturday, August 7, which is 90 days after date of adjournment.

One shipment of over 33,000 olive trees was received in Marysville, Yuba County, last week. They will be set out in the Mission District near Honcut.

The Ashley-Chandler bill intended to force fruit standardization and an honest pack has been passed and it is claimed will be signed by the governor.

A farm bureau unit has been organized at Madison, Yolo County. Regular meetings will be held on the second Tuesday of each month. Byron Archer Madison, has been elected director.

Fruitmen of Placerville, Eldorado County, estimate that 400 carloads of pears, peaches and other deciduous fruits will be shipped from the Placerville section this year. This is 100 carloads over last season's shipments.

Oroville celebrates today the turning of the waters of the Feather River into the Western canal. This canal will bring irrigating water to 20,000 acres of land. All the nearby towns are asked to join in the celebration.

Farm Adviser Baade of Napa County has mixed a quantity of poisoned grain according to government formula and this will be supplied by the farm bureau to members at cost price to use in the fight against the squirrel pest.

The board of supervisors of Sutter County has passed an order requiring extermination of squirrels on all property in the county. Horticultural Commissioner Stabler has been appointed inspector, with authority to prosecute the work.

Central California

Tulare peach growers report an unusually heavy crop setting.

Automobile registrations for the state during the month of April numbered 7,813.

The engineer's report on the Lindsay-Strathmore irrigation project has been given out.

Monthly cream checks paid to Kings County dairymen the middle of the month aggregated $140,000.

The citrus growers of Tulare County are still much interested in the fight against the gray scale.

The Denair branch of the Stanislaus County farm bureau has announced a picnic for July 4 at Denair.

The Stanislaus County farm bureau anticipates the appointment of a farm adviser for that county on July 1.

Several experimental plantings of tepary beans have been made in the Oakdale section of Stanislaus County.

Word is being sent out to all parts of the state that there is no more need for men in the orange groves and packing houses.

In the southeastern section of the Oakdale irrigation district of Stanislaus County over 1,000 acres of beans are being planted.

A large amount of newly processed fruit has just been shipped by the Tulare County board of trade to the San Diego exposition.

A special stock train of 23 cars was required to handle the spring shipment of steers from the Gill Brothers' Ranch near Exeter.

At a mass meeting of orange growers, held at Lindsay, Saturday, May 15, the Citrus Protective League of Tulare County was organized.

The government is advertising for bids to furnish 200 pure bred Shorthorn heifers and ten pure bred bulls for the Tule River Indian reservation.

Bakersfield has adopted the city manager plan. The position will be filled by Wallace M. Morgan, for many years editor of the Bakersfield Morning Echo.

The late rains have done much damage to the watermelon and cantaloupe crops in the Dinuba section of Tulare County. Some replanting is being done by growers.

A new freight schedule on dried and canned fruits has been requested of the interstate commerce commission by the Southern Pacific. The new schedule will lower prices.

At the May meeting of the Santa Clara County Pomona Grange reports from various fruit districts indicated that the coming crop of deciduous fruits will be as follows: Prunes, 60 per cent of normal crop; apricots, 63 per cent; apples, 70 per cent; cherries, 40 per cent; pears, 57 per cent; peaches, good.

The San Joaquin County Almond Growers' Association held its annual meeting at Lodi Friday, May 14. All the old officers were re-elected. They are: F. M. Cramlett, president; A. S. Lasell, vice president; T. A. Botts, secretary and treasurer. A. S. Lasell was elected to represent the local association in the California Almond Growers' Exchange.

Southern California

The sugar factory at Anaheim has contracted for about 14,000 acres.

One cotton gin at Calexico ended the season with a record of 5,700 bales.

A large acreage is being planted to beans in the Talbert section of Orange County.

Brawley, Imperial County, is now making shipments of apricots and cantaloupes.

Boys of the Fillmore high school agricultural club are talking of holding a capon feeding contest.

The Covina Farmers' Club held a picnic at Sawpit Canyon, north of Monrovia, Saturday, May 15.

Some carload shipments have been made from the newly constructed Fontana orange packing house.

Orange County reports a very large walnut crop in prospect. Considerable blight is showing in the orchards.

Manager Brock of the Heber Date Gardens expects a date crop at least three times as large as last year's.

Three carloads of cotton were shipped from Calipatria, Imperial County, to New Orleans last week.

The San Diego Floral Association held its annual spring rose show at the exposition grounds last Saturday.

The Inland Waterways Association of California will hold its semiannual congress in Los Angeles in September.

Cantaloupe growers of the Brawley district have not yet determined on a marketing plan for their this season's crop.

Dairymen of San Luis Obispo County expect that the rainy season will give them green feed for at least six weeks longer than usual.

The Protesilaus, a British steamer, sailed from Los Angeles harbor last week with 1,000 bales of Imperial Valley cotton, bound for Liverpool.

Heavy plantings of beans are being made on the big San Joaquin Ranch in Orange County. Several growers are planting between rows of young trees.

The Ventura County farm bureau will hold its annual meeting at Foster Park Saturday. There will be a basket picnic and a program in the afternoon.

The Santa Barbara and Carpinteria walnut associations have been sold out for several weeks. The growers of that section fear that nuts are setting too thickly for quality.

The Beaumont Fruit Growers' Association at its recent annual meeting elected the following directors: N. C. Beebe, R. N. McCahn, Frank Doughty, R. D. Rosenberger, L. B. Storer, K. R. Smoot and W. J. Dwyer.

The sixth meeting of the chamber of commerce of Northern San Diego County was held at Fallbrook, Wednesday, May 12. There was an attendance of 400. The next meeting will be held at Escondido June 9.

Peach growers are somewhat worried over the fact that buyers have not yet appeared for the canneries. High price of sugar and big carry-over from the 1914 pack are reasons assigned for backwardness of the canners.

The Coast

Portland, Oregon, will hold its ninth annual rose festival June 9-11.

One hundred thousand sheep are being sheared at Brogan, Oregon.

Prescott, Arizona, will have a Frontier Days celebration July 5-7.

It is reported that the prune crop of Lane County, Oregon, will be short.

Several large clips of wool have been sold at Arlington, Washington, at 25 and 26 cents.

Aberdeen, Washington, reports a forest fire near Montesano which destroyed some timber.

The Inland Empire Jersey Breeders' Association held its first annual sale at Spokane, May 10.

Many sugar beet and potato clubs have been organized among pupils of Boxelder County schools in Utah.

San Simon, Arizona, has formed a local branch of the Arizona Farm Improvement Association with Guy Sisson as president.

Wheeler County, Oregon, has a newly appointed county agriculturist in the person of Orren Beaty. Mr. Beaty's headquarters will be at Fossil.

The Inland Empire of Washington had a severe rain and snowstorm the first of the month. Walla Walla reports two feet of snow on the higher elevations.

The Oregon mohair season was brought to a close by the sale of the Lebanon pool of 20,000, which went at 33 3-8 cents. This was the highest price paid this season.

Phoenix, Arizona, has been suffering from a plague of grasshoppers. Residents requested the city council that street lighting be descontinued during the prevalence of the plague.

The North Pacific Fruit Distributors has issued a bulletin to all locals calling attention to the fact that berry crates must be stamped with weight of contents to comply with federal law.

The Cashmere (Oregon) Fruit Growers' Union averaged for its members this year 69 cents per box for apples; the Medford Association, 61 cents, or an average for a five-year period of $1.04.

The Northwest Shippers' League and the Northwest Growers' League recently assembled at Spokane and adopted rules for packing and grading apples. The grading of other fruits was also discussed.

Announcement has been made by the Southern Pacific Railroad that there will be no advance in minimum weight of carloads of canned goods to Eastern markets. The minimum will remain at 40,000 pounds.

The Washington Farmers' Union will hold its annual state convention in Spokane, May 25-27. Officials expect an attendance of 2000. The president of the National Farmers' Union will be among the speakers.

The governor of Arizona has raised the quarantine on live stock from Colorado, New Mexico and Texas, also on grain from those states. It will not even be necessary to have certificate of state veterinarian on cattle shipments.

Live Stock and Dairy

A COSTLY CONTEMPT.

THE old Bible speaks of certain men "who know more than seven men who can render reason." All the time is the truth of this saying being demonstrated in regard to tuberculosis in cattle. Herd after herd is killed that might nearly all have been saved had the owners been willing to do those things that experience has demonstrated must be done to keep a herd free from this disease. The trouble comes in most instances from a sort of self-willed contempt on the part of the farmer for the conclusions of science. Often expressions like the following will be heard when farmers converse with one another: "I don't take any stock in the tuberculin test." "The test isn't reliable." "We didn't use to have any trouble of this sort till the veterinarians got to stirring up this mess."

And so it goes that the farmer braces himself against a wise judgment and greatly to his cost in the end. He learns when it is too late that even if the tuberculin test is not absolutely reliable there is no doubt whatever that tuberculosis is a fearful reality. This sort of self-conceit, a disposition to discount in a great measure the real truth as it really exists, has cost hundreds of men their entire herds. And yet the work of destruction, as well as the same dangerous contempt of danger, is constantly going on and we presume will go on till the end of time.

"Safety First" is a motto in regard to other dangers that we read of constantly in the papers. There has been a frightful loss of life in all ways because of the lack of due caution. Before the days of kerosene, gasoline, automobiles, and a hundred other appliances of modern civilization, life was a much more simple, as well as safe, matter. And so it is with these contagious diseases in regard to live stock. As farmers we are liable to forget that just in proportion as we increase the live stock population do we increase the ratio of danger of contagion. When cattle and swine were comparatively few, as they were 40 years ago, we knew but little of tuberculosis, hog cholera, and foot and mouth disease. But we have greatly increased our live stock and so have increased our danger also.

We must incur expense in stable construction, in the use of dsinfectants, etc., that were not needed years ago. We must fill our minds with the right knowledge on these matters and be vigilant in the use of that knowledge or as sure as fate we will suffer in the end. Above all we must not take on a dangerous contempt for what science has to teach us. We must know more, do more, and exercise more caution than we have in this matter, especially of tuberculosis in cattle. And we will find in the end that it pays in a financial way to know and do all these things that make for the health and efficiency of our dairy cattle.—Hoards Dairyman.

PACIFIC INTERNATIONAL EXPOSITION

Among the very many activities of the department of live stock of the Panama-Pacific International Exposition which have for their object the showing of the utility side of the live stock industry, there is none perhaps which will appeal to a wider range of clients than the milk show which will be held by this department in Congress Hall, June 14 to 19, 1915. Classes and prizes are provided as follows:

City Board of Health Class, Milk and Cream—Gold medal for the largest total number of regular exhibits of milk and cream. Gold medal to the board of health and $100 in gold to the chief dairy inspector having the highest average score of ten regular exhibits of milk or cream, regardless of class.

Cream Dealers' Class—For the highest average score for ten or more producers, first prize gold medal; second prize silver medal. A special prize to the dealer having the greatest number of producers exhibiting in the market cream class, a medal of honor.

Milk Dealers' Class—For the highest average score for ten or more producers, first prize gold medal; second prize silver medal. Special prize to the dealer having the greatest number of producers exhibiting in the market milk class, a medal of honor.

College and Experiment Station Milk Class—For the highest scoring milk in this class, first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for the highest scoring milk or cream in the college and experiment station contest, regardless of class, a medal of honor. All exhibits receiving a score of 90 or more will be given a diploma of merit.

College and Experiment Station Cream Class—For the highest scoring cream in this class, first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for the highest scoring milk or cream in the college and experiment station contest, regardless of class, a medal of honor. All exhibits receiving a score of 90 or more will be given a diploma of merit.

Pasteurized Milk Class—For the highest scoring cream in this class, first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for the highest scoring milk or cream in the pasteurized contest, regardless of class, a medal of honor. All exhibits receiving a score of 90 or more will be given a diploma of merit.

Pasteurized Cream Class—For the highest scoring in this class, first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for the highest scoring milk or cream in the pasteurized contest, regardless of class, a medal of honor. All exhibits receiving a score of 90 or more will be given a diploma of merit.

Market Milk Producers' Class—For the highest scoring milk in this class, first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for highest scoring milk or cream in market contest, regardless of class, a medal of honor. All exhibits receiving a score of 90 or more will be given a diploma of merit.

Market Cream Producers' Class—For the highest scoring cream in this class, a first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for the highest scoring milk or cream in market contest, regardless of class, a medal of honor. All exhibits receiving a score of 90 or more will be given a diploma of merit.

Certified Cream Class—For the highest scoring milk in this class, first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for the highest scoring milk or cream in the certified contest, regardless of class, a medal of honor.

Certified Cream Class—For the highest scoring cream in this class, first prize gold medal; second prize silver medal; third prize bronze medal. Special prize for the highest scoring milk or cream in the certized contest, regardless of class, a medal of honor. All exhibits receiving a score of 90 or more will be given a diploma of merit.

Medical Milk Commission Class—To the commission having the highest scoring sample of milk or cream in the certified milk or cream classes, a medal.

To the commission having the highest average scoring for three or more regular exhibits of milk or cream in the certified milk and cream classes, a medal.

Entries are required on the official entry blanks which will be furnished on application to the department of live stock. All shipments of milk and cream must be made by prepaid express, addressed to President of the Panama-Pacific International Exposition, in care of the Dairy Delivery Company, 3550 Nineteenth street, San Francisco, Cal.

All specimens entered in the various classes must be produced on Monday, June 7, 1915, and shipped at once, if from the United States or Canada. Exhibitors not residing in the United States or Canada may secure their milk or cream at a date which will enable them to deliver in San Francisco not later than June 12, 1915.

LICE ON HOGS.

No good stockman will maintain hogs or any other kind of animals that are being constantly worried with lice, says Dr. R. H. Williams, animal husbandman of the University of Ariona agricultural experiment station. Hogs in the Southwest are especially troubled with these pests. The lice creep around on the skin causing considerable uneasiness as well as loss of blood. They are reproduced by the adults laying eggs, or "nits," that become attached to the hair where they mature.

Treatment

There are many ways of treating hogs to eradicate lice. The common methods is to corner the pigs with two hurdles and apply crude oil by means of an old broom. Kerosene and lard made up in equal proportions also makes a good preparation to be aplied in this manner. Sometimes an oil can is used to pour kerosene along the backs of the hogs. This is splendid for killing lice, but it is too active as it will remove the hair and blister certain parts of the skin.

Automatic devices which allow pigs to rub against an oiled surface have been placed on the market. The pigs soon learn to rub the portions of the body affected by lice against the oil which will kill the insects. This plan requires no time after installation except to keep the reservoir filled with oil. The medicated hog wallow has been recommended by some stockmen. This consists of pouring crude oil on the surface of the hog wallow.

The best method for destroying lice is to select a standard coal tar disinfectant and make this up according to the directions of the manufacturer. This should be placed in a dipping tank and all hogs treated. It has been found that three per cent creol, five per cent zenoleum or a kerozene emulsion will make especially useful dips. All hogs should be treated at least once a year and special care exercised to make certain that the brood sows are free from lice before farrowing. If this method is followed it will be unnecessary to dip the young pigs. To exterminate lice during cold weather it is best to use crude oil as this will not cause the animals to take cold. Some recommend the use of common sulphur which they spread in the hog's bed. This will be melted by heat of the body coming in contact with it which will cause sulphur fumes to arise, thus killing the lice.

It must be remembered that the various forms of treatment previously recommended will not destroy the eggs. One should treat a second or possibly a third time to make certain that all nits have been killed. The length of time between dippings should vary from four to eight days, the shorter time being allowed in summer when the eggs mature most rapidly.

This is a simple means of improving the quality of the animals and increasing the profits. If farmers would combine to eradicate lice and other parasites, they would obtain much better returns from their feed and animals would develop more satisfactorily. It is possible to exterminate lice by a hearty cooperation among stockmen of any district.

SHADE FOR PIGS

Too much emphasis cannot be placed upon the necessity of having suitable shade for pigs as well as suitable yards, pastures and water, advises G. W. Barnes, Livestock Specialist of the University of Arizona Agricultural Extension Service.

No great amount of expense is necessary for the construction of the shade, but it is well to plan so that the pigs may secure pasture and water and be surrounded by sanitary conditions. The chief requisite in the construction of shade is to have it as cool as possible in the hot summer months. To effect this purpose it would be well to have the shade so constructed that it is open on all sides and so situated that water may be sprinkled under shade in the middle of the day—not enough to make a mud puddle but enough to keep it cool and damp. This shade may be constructed by taking ordinary fence posts; set these two or three feet in the ground and about 8 feet apart. Fasten them together at the top by 2 x 4's; stretch and nail hog wire to and between these 2 x 4's; cover with straw or hay. This makes the best kind of shade. Movable shade may be made upon the same plan, except do not put the posts in the ground but fasten them together at the bottom by 2 x 4's or 2 x 6's, and make these so that a team may be hitched to them, thus enabling the farmer to move the shade from one pasture to another.

HOLSTEIN-FRIESIAN ANNUAL

The thirtieth annual meeting of the Holstein-Friesian Association of America will be held at Syracuse, New York, June 2. Of course there will be reports from various officials, including the superintendent of advanced registry, who is Mr. Malcolm H. Gardner, Delavan, Wisconsin. There will be resolutions touching upon foot and mouth disease, upon state and local Holstein-Friesian clubs and the tariff on milk products. The present officers, most of whom it is presumed will be re-elected, are: Treasurer, Wing R. Smith, Syracuse, New York; secretary and editor, F. L. Houghton, Brattleboro, Vermont; superintendent of advanced registry, Malcolm H. Gardner, Delavan, Wisconsin.

Much has been written on the importance of weighing the milk from each cow so that the poor ones may be discovered and sold. It may seem quite a task to weigh and record each cow's milk at every milking, but it really takes very little time and after one gets in the habit of doing it he will find it more of a pleasure than a task. If one really likes cows and is in dairying for profit—and no man should go into the business expecting any profit unless he does like cows—he will not grudge the little extra labor of weighing and testing each cow's milk.

Since mother is the most important personage in the house because of her influence, vacation, rest and recreation are of paramount importance. The children will love her better and she will have a greater influence for a happy home life if she be given ways and means of seeing more of people and of life in other neighborhoods.

Men seldom do their best until forced by necessity to do great things. This is why in ordinary times there are so few to undertake great things. In times of a crisis in a system of crop growing every one should do his best to meet conditions and bring greater prosperity.

Many men get discouraged because it seems that they are always hard up. If they would take an inventory each year and could take a look at that ever increasing "net worth," they would feel entirely different.

It pays to oil your harness — makes it last longer. Harness costs money. The longer service it gives, the more money in your pocket.

EUREKA HARNESS OIL

is a scientific preparation for preserving harness. It fills the thousands of pores in leather, resisting the attacks of sweat, dust, moisture and heat. It preserves the original life, strength and black color of your harness. Have your harness dealer dip your harness in Eureka Harness Oil occasionally, or buy a can and apply it yourself. Dealers everywhere.

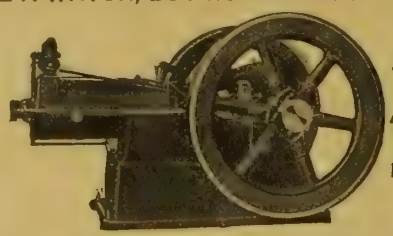
ALPHA ENGINES

BUILT UP TO A STANDARD, NOT DOWN TO A PRICE
BUILT LIKE A WATCH, BUT RUGGED AS A BATTLESHIP

No Batteries
No Coil
No Troubles



A Big Hot Spark
A Quick Start
Results

THE MASTER ENGINE OF THEM ALL

What other Engine Manufacturers are still striving for we give you in the ALPHA. There are over 500 different makes of engines today, but only in the ALPHA ENGINES will you find all of these glowing triumphs:

SUSTAINED POWER EVEN AFTER YEARS OF USE.—This engine, like the trained athlete, grows better by action. Its uniformly exposed valves are not affected by the cylinder heat. So there is no warping, no leaking, no power wasted. Think of the years of extra service this master engine will give you.

NO VIBRATION; SMOOTH RUNNING AND LONG LIFE.—Each fly wheel is perfectly balanced and machined all over, excepting spokes, which makes them absolutely true. This does away with any unnecessary strain and adds years to the life of your engine.

SPECIAL GEAR DRIVEN MAGNETO AND NO BATTERIES.—All Alpha Engines are equipped with special built-in, gear-driven magneto which is guaranteed for the life of the engine. Batteries such as are commonly used are not necessary with Alpha Engines. A big saving in time and money.

FUEL ECONOMY.—Alpha Gasoline Engines combine great fuel economy with maximum power production. According to Government Tests will soon pay for themselves in saving of fuel over other American makes.

An Engine that lacks these features may cost less. But it will cost more to operate and keep up. When once you know the years of extra service these features add, you will have no other than an ALPHA.

Built in sizes from 2½ H. P. to 100 H. P., hopper or tank cooled, portable or stationary type.

We handle complete line of Viking Pumps. Self-priming, high efficiency and especially designed for irrigation work.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Frost Injured Corn and Potatoes

A subscriber inquired some time ago as to probability of plants growing which had been seriously injured by frost. The matter was referred to an old-time farmer and he says that both corn and potatoes which are not more than three or four inches high will often recover without apparent damage.

Blasting

Have a ten-year-old orchard which I wish to blast. A black abode soil is underlaid at a depth of from three to four feet with hardpan. How far from trunks of trees will be safe to place the blast? Have been told four feet.—Subscriber, Sonoma.

When one contemplates blasting we would recommend obtaining from the company supplying the dynamite or powder complete instructions for its use. In a word, however, we may say that best results are obtained by blasting when ground is dry. Usually in the case of trees it is done at intervals, blasting one side only at a time. Four feet would be rather close unless a small charge was used, say one-half stick or less of 25 per cent dynamite.

Rat Exterminator

Mrs. Laura J. Jones of Gilroy writes in answer to a request for information as to extermination of rats that she has been informed that Azoa, which is a rat virus, is excellent for reducing the pest. This is a proprietary article put up by Parke, Davis & Co., and we doubt not if used according to directions will aid in wiping out the pest. It is supposed to work on rats and mice and is not injurious to human beings, poultry or other animals.

Fertilizing Alfalfa

Please advise best fertilizer to use on alfalfa after it is up. Cannot obtain stable manure. The land has been in grain for years without being fertilized.—Subscriber, Escondido.

The best suggestion we can offer in this case is to use complete commercial fertilizer. However, we doubt not the greatest need of your land is vegetable matter and that could only be secured by applying stable manure or some other coarse material. This is a case where the planter has an opportunity to do some practical experimenting, for the use of a commercial fertilizer in a strip across the field or in the entire field, save for a strip across it, will show the difference between fertilized and unfertilized land.

Little Leaf

Planted peach trees this season which have not leafed out as they should. They were of thrifty stock. Whitewashed them to prevent sunburn. Would this prevent growth?—Subscriber, Hemet.

See article on Little Leaf on page 511 of the Cultivator of April 29.

Black Eye Beans

What is the botanical name of the ordinary Black Eye bean?—Subscriber.

The Black Eye bean is botanically a cow pea, the scientific name of which is Vigna Unguiculata.

Weevil

When is the best season to plant beans to discourage weevil?—Subscriber.

Concerning the control of the bean weevil by varying the season of planting it has been our experience that very little can be done for the control of the insect in this manner. Since the bean weevil breeds during the entire summer in the field, a new brood being produced at intervals of about 60 days, it is found that the insects are present to damage the crop regardless of the season at which they are planted. However, beans which are planted rather early in the season because of the smaller number of insects present at this time of the year are not so apt to be seriously damaged as those planted later in the season. The most effective means of control known for the bean weevil is to use clean seed. If at harvest time any insects are discovered in the beans they should be fumigated with carbon bisulphide. If this is thoroughly done the work of the insect can be largely controlled and clean seed will be insured for the next year's crop. Some growers immerse their seed in a tub of water just before planting and skim off the badly damaged seed which float to the surface. It has also been suggested that the seed be heated to about 131 degrees Fahrenheit, which will destroy any insects which may be present.

Tainted Eggs.

Two of our hens lay brown eggs which have an awful odor when boiled. Eggs are gathered every night. Can you tell me the cause?—Subscriber, Gilroy.

What have your hens been eating? Onions, garlic, fish, and almost any strongly odorous food will taint the eggs if eaten in large quantities. Some times an egg that is perfectly fresh and sweet will absorb such odors from without. Have you used anything about the nests that might taint the eggs or have they been in a close closet with something of this sort? Are these two hens with others that lay normal eggs? Do they have range or are they confined? The pale color of the yolk indicates lack of green feed but gives no clew to the cause of the abnormal odor. I think if you confine these hens for a few days and see that they eat nothing that can possibly taint the eggs and that the eggs are kept where they can absorb no odor, you will find the eggs becoming normal again.—J. A. K.

Black Beetle.

Can you tell me what will destroy a black beetle about one inch long and with four legs, a sharp head and nose? When I was a child we called them stinkbugs. When disturbed they stick their heads down to the ground. They are destructive on crops here, nearly as bad as gophers. Can you tell me how I can get rid of them? This is the first year they have been so destructive.—Subscriber, Carpinteria.

If you will examine more carefully the bugs to which you refer you will find that like all insects they have six legs. The best treatment for these old-time stinkbugs, cabbage bugs and burrower bugs, all of which belong to the pentatomidae family, is hand-picking and destroying. In order to catch them with least labor place large leaves, boards or other covering loosely on clods on the ground and they will gather under this during the heat of the day, when they may be picked up in large numbers. Paris green spray used on the plants will help to a certain extent but this is not so sure as hand picking.

Mash For Laying Hens

Is the following formula a good one for making hens lay when used in connection with either barley or milo night and morning for the grain part or the ration? The mash to be before the hens all the time: 80 pounds bran, 10 pounds feed meal (corn), 6 pounds blood meal, 17 pounds alfalfa meal. When, what month, is the proper time to commence getting the hens ready for the forced moult in order to have them ready to commence laying again in September or October?—Subscriber, Chino.

Poultry for Profit

"SAFETY FIRST" FOR BABY TURKEYS.

Written for the California Cultivator
By Jean A. Koethen.

THE great mortality among baby turkeys seems to be due, generally speaking, to two things: a widespread misconception as to their real needs; a certain predisposition of the poult itself to "liver trouble," which is simply another name for blackhead disease. Why this should be so I do not know. Whether it is as some have held because of the very common practice of inbreeding or because of the still more common practice of breeding without regard for vigor or because turkeys have been from the beginning raised with chickens and on the same feed, the fact remains that poults must always be fed with due regard for their livers.

Rules are stupid things, but it is possible perhaps to lay down a few fundamental principles which may be a sort of guide for those who want to save their baby turkeys. If I were formulating such a set of principles I should write:

Keep Turkeys away from Chickens.

The reason for this was given quite fully in a previous article. The parasite which causes blackhead in turkeys often exists in the intestines of chickens without apparently affecting their health. These coccidia are voided in the droppings and become a source of great danger to turkeys of all ages. Turkeys should not only be kept away from chickens but they should be on absolutely clean soil. If chickens have been in the same place the soil should be purified by having a crop grown upon it for at least six months.

Feed Less than Poults Want.

Whether or not the coccidia which induce blackhead are already in the system, the amount fed has a very large influence upon their development. Overfeeding clogs the digestive organs and gives opportunity for the immediate development of these troublesome parasites. Underfeeding, that is, what seems to us underfeeding, and especially the feeding of cottage cheese, onion tops, chopped onions and lettuce, has a tendency to check the development of the parasites, and if the poult is tided safely over the first two or three months it has, so to speak, a chance for its life.

Now it is very easy to say, "Keep them hungry," but nothing is harder. Little poults are so hungry, so confiding, and the little they can digest is so very little that we are all bound to fall into the same ditch unless we keep a very firm hand on the reins.

The Rhode Island station says, "Prepare what you think the poults should have and then feed half of it or less." This is a pretty good rule, but a bit indefinite. Last year I began with a teaspoon of feed for ten turks, increasing the amount as slowly as they would let me. This year I am trying to hold myself down to the teaspoon rule and also to follow another, which is however much I offer, to remove it while the poults are still ravenously hungry. In order to do this it is necessary to feed out of the hand, and this is the method of feeding recommended by the government. It has the advantage of keeping the poults tame and gives the feeder opportunity to watch them and to take his hand away as soon as the edge of their hunger has been dulled, but it is not easy, not a bit easy. When the poults follow me, crying for more as I leave them, I feel pretty sure they have not had too much, but I may be mistaken even then. The fact is the only way to know positively that you have not fed too much is like the test for mushrooms. If the poults die you know they have been overfed; if they live they have not had too much.

Feed Cottage Cheese Every Day.

I feed it these first three weeks three times a day, mixed with chopped onion tops, stale bread and cracked wheat or pinhead oatmeal. Some breeders are successful with hard-boiled egg, chopped, shell and all, with stale bread or rolled oats; others with a ration of small grains, but the majority find cottage cheese necessary, and the Rhode Island station considers it almost essential. The cottage cheese seems to take the place of the bugs and worms the poults would find on good range and at the same time holds the blackhead parasite, if it is in the system, in check.

Feed "Little and Often."

Some breeders feed only three times a day, but there seems to be less danger of clogging the digestive organs if food is given oftener and in smaller amounts. I feed five times a day the first three weeks. Last year I gave the same food at each meal. This year after the first week I began giving chopped lettuce and onion at the mid-forenoon and mid-afternoon meals, and the cottage-cheese-cereal mixture morning, noon and night. I know a woman who keeps bran and charcoal in a pan before her poults from the first and another pan of clabbered milk which they may dip into as they will, and I do not see why such a ration with plenty of green and cracked wheat once a day should not do very well. Poults should be taught to eat grain from the first, but they must have greens and sour milk in some form.

Look Out for Lice.

I have never seen a turkey louse myself because I keep my hens and poults well dusted. When dusting is neglected, as it is apt to be in large flocks, lice will kill poults as quickly as over-feeding. If hens and poults are dusted once a week there should be no trouble.

Keep Them Dry.

Overfeeding, lice and dampness are the evil trinity of baby turks. Keep them in when the grass is wet in the morning. Protect them well when it rains. See that they have a board floor under their feet in the coop.

Grit and Greens at Every Meal

Even more than chicks do baby turks need grit for grinding their food. Even more than chicks do they need green feed to keep the liver working as it should. Chopped onion tops are the traditional green feed for turkeys and they are cheap enough. Lettuce is second in value, if not equally good. Alfalfa range as they grow older is invaluable. The Rhode Island station says green food and sour milk are the only feeds which may be given turkeys ad libitum and that they will do well on these and nothing else. The poult that is on good range with a turkey mother picks its grit and greens at every step, a nibble of grass and a grain of sand, then a nice, jucy bug or grasshopper. If we imitate this way of feeding we shall not go far wrong.

Never Confine Poults.

The second day after mine are hatched they are put with the chicken hen that hatched them in a coop to which is attached a wire run. The first three days the mother is kept in the coop by a two-inch wire but the poults have the privilege of the run. As the poults come to need less hovering the mother is given the freedom of the run but one end is raised so that the poults may come and go as they will. A chicken hen walks too rapidly for young turkeys. When she is confined they always know where to find her and she cannot drag them into the wet grass or tire them with her scratching.

A live stock show will be held at Nez Perce, Idaho, June 23-24.

INFERIOR BIRDS IN BREEDING PENS.

We make a sad mistake by allowing those inferior, weak, small, droopy, slow-maturing females in our breeding pens and expecting to get rapid growing, early maturing broilers and winter laying pulets. This is a practice too often noticed among our poultrymen and is the worst thing we can do because these inferior hens will produce inferior offspring, provided you get the eggs to hatch (and it is lucky for you if you do not). These poor eggs will take up as much room as good eggs will. This accounts partly for the small hatches you so often get, as in eggs from this type of hen the chicks very frequently die in the shell. Those that do get out will not grow fast, and a large per cent will die. If there are any disease germs flying around they will be sure to catch them and give the disease to the strong, healthy chicks. And if you finally succeed in getting them to the point where they might be expected to give some return for the time and energy expended they will not respond.

J. A. Helmreich, who has charge of the poultry plant at the Colorado agricultural college, says: "In my experience pullets hatched from poor hens grow slowly and do not mature until after cold weather sets in. Consequently they do not lay until spring, and then only for a short time, while pullets hatched the same time, fed the same feed and sheltered in the same house, from strong, vigorous hens, hatched six months or so before cold weather, will lay the greater part of the winter, throughout the spring and part of the summer. Then after moulting in the fall they start on another profitable year of egg production."

Mr. Helmreich also suggests that you select your breeding stock in the following way: Mark those hens which are the first off the roost in the morning and the last on in the evening; those good old hens which seem to be busy all the time, rustling for themselves in order to collect enough food to produce the eggs a good hen must produce and at the same time keep up the requirements of her body. Then get the cock bird who is "boss" of the flock and mate him with these hens. By doing this a large per cent of your troubles will be solved.

BLACKHEAD

A number of our neighbors are having poor results with young turkeys, they droop and die after about four weeks of age, do not seem to have much particularly wrong with them, but begin to droop in the morning generally and in three or four hours die. Examination shows diseased liver and intestines blackened and hard. Feed rolled oats, hard boiled eggs, ground up and entire egg fed, shell and all, plenty of green cut alfalfa and onion tops. Also feed each noon, only, cottage cheese blackened with charcoal. We have a bunch of turkeys coming on and wish to avoid the same trouble. Three of our neighbors have lost the larger percentage of their young turkeys in the above manner. One of these neighbors last year marketed about 500 and didn't have this loss with the young birds.

We are told the trouble is blackhead and is inherited from the gobbler.—Subscriber, Escondido.

Poults with "liver trouble," which is generally only another name for blackhead disease, always have some diarrhoea. Probably your neighbors' did, but it was not noticed, and in the end they seemed to die suddenly, though they may have been ailing a little for days. When turkeys die in this way it is safe to assume that they have been overfed, but by no means so easy to say just how much food they should have had. Last year I fed a teaspoon to ten turks five times a day, increasing the amount as they demanded it, but keeping them always ravenously hungry, and raised nine of the ten. This year I am going to reduce the number of meals to three after the first week, and give a little more, if necessary. The poults should be kept so hungry that they will hunt for food for themselves. This gives them exercise and

For Sale—Registered. Berkshires:. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy. Perkins, Sacramento Co., Cal.

Registered O. I. C. Swine—Litter of swine, the finest I ever bred. Farrowed Feb. 23, 1915. Bred right, fed right. Won't last long on market. Price, Twenty Dollars each. G. H. DuBois, San Martin, Cal.

For Sale—Fine, registered 3-year-old, 600-pound Tamworth boar for $75; also young Tamworths and young pure-bred Polled Angus bulls. Fred B. McCay, Cathay, California.

Blatchford's Pig Meal weans pigs easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Cholera Immune—Registered Berkshires of all ages, both sexes, from large-boned pigs. Riccomi Bros., Mountain View, Cal.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Novato, Cal.

Berkshires Registered—Young stock from Masterpiece Strain at $10 each. Weaning age. G. A. Casey, Box 7, King Rd., San Jose.

Registered Toggenburg Buck Kids. An exceptional chance to secure the best stock. H. W. Shepard, National City, Cal.

Poland Chinas—Young stock; either **sex.** Write for pedigree. **Reasonable prices.** Edwd. A. Hall, Watsonville, Cal.

Glenview Poland China—Stock for sale. Chas R. Hanna, R. F. D. No. 3, Riverside, Cal.

Pedigreed Duroc Jersey Boars or sow pigs —Extra fine. John Kincaid, Box 151, East Bakersfield, Cal.

For Sale—Thoroughbred Duroc Jersey Boars and Gilts, strong and vigorous stock. Fred Hart, Exeter, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

For Sale—A well furnished creamery, equipped with two 600-gallon Jensen Ripeners; one No. 9 Simplex Churn, all new; other accessories and implements; located in one of the best localities in Imperial Valley. Must be sold for cash. Address C. B. Johnson, Calexico, or H. L. Welch, at El Centro.

For Sale—Milk Route, about 300 customers, $600 per mo., lease on 3 acres and all equipment in South Pasadena. $1500 takes all. Herbert F. Clark, 31 N. Granada, Alhambra, Cal.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

For Sale or Trade — $500.00 equity in $950.00 lot just out of Los Angeles. Will consider Ford or what have you? B. C. Dodson, Glendora, Cal.

Wire Fence and Netting—American and Square Deal, at CUT PRICES. FREE Catalogue. Old Hickory Sup. Co., Dept. 4, Los Angeles, Sacramento, San Francisco.

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

Pure-Bred Heavyweight Flemish Giants—Young stock. May trade for other rabbits and pet stock. Herbert Habecker, Hughson, Cal.

Bosworth's Imperial Red New Zealand Hares sold at hard times prices. NOTHING BETTER. Geo. M. Bosworth, Geyserville, Cal.

Caldwell's Royal Red New Zealands scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

Belgians—Heavyweights. With or without pedigree; express paid. Old Hickory Supply Co., Dept. 4, Capitola.

QUESTIONS AND ANSWERS

(Continued from Page 616)

Bran is too bulky and at present too expensive to be made so large a part of the mash. It would be better to use middlings and ground barley instead of part of the bran, in equal proportions, and beef scrap or fish scrap instead of the more concentrated blood meal, adding extra protein in one of the vegetable meals. Your formula would then read: 20 pounds bran, 20 pounds middlings, 20 pounds ground barley, 10 pounds feed meal, 10 pounds alfalfa meal, 10 pounds beef scrap, 10 pounds fish scrap, or 20 pounds of either beef scrap or fish scrap. A little salt and charcoal. You can use either beef scrap or fish scrap or half of each, as in the above formula, or you might use 15 pounds of beef scrap and five pounds soy bean meal. The mash ration in use at the egg-laying contest at the exposition consists of five pounds bran, five pounds shorts, five pounds ground barley, three pounds meat scraps, two pounds soy bean meal, one-half pound charcoal, one-tenth pound salt, but cracked corn is used in the grain ration. When no corn is fed in the scratch ration it is a good plan with Leghorns to use a little feed meal in the dry mash, except in hot weather. The animal portion of the mash should be from 15 to 20 per cent.

I should not begin to prepare hens for the forced molt before the first of August unless you mean by "prepare" the cutting down of the ration of overfat hens, which may well begin with the beginning of hot weather. People who think it best to force the molt begin to starve the hens early in August when they should all be molting, but the plan is not highly recommended. It is easy to make hens stop laying but by no means so easy to make them begin again, and the safest plan seems to be to let them molt when they please. Feed them well right through the summer. Some will lay till November; others will molt early and get to laying early; others will lay right through the molt. Don't tamper with the laying hen.—J. A. K.

Rabbit Feeding.

My rabbits are very thin and seem to have diarrhea. Feed green alfalfa and keep pens clean.—Subscriber, Corning.

This question was referred to Mrs. J. M. Sevier who answers:

"Where looseness of the bowels occurs it is best to sprinkle a little sulphur with the grain; eliminate green food entirely for awhile and give about a teaspoon of Epsom salts in one-half pint water. Green food in quantity is always dangerous to the health of young stock and very unsatisfactory for fattening rabbits except when used very sparingly as an appetizer; in such cases a little cabbage, carrots, kale or chickory may be used each day—the latter being preferable as the rabbits do not overeat of it and it acts as an astringent rather than a cathartic. This, with plenty of dry alfalfa hay and a handful of rotted barley twice a day to each doe, plenty of clean fresh water and a lump of salt close by should constitute the diet of a perfectly healthy rabbit. There should be no limit to the amount of food given to the fattening stock providing there is of course no waste—"little and often" being a good policy to follow. The object is to fatten and turn your market stock as quickly as possible. Green alfalfa as a substitute for dry alfalfa hay is very unsatisfactory to those raising market rabbits, for it not only gives them bowel trouble but also makes the dressed meat soft and flabby and very unpleasing in appearance."

Curing Egg Eating

A subscriber at Glenn writes of having noticed an inquiry as to curing hens of egg-eating and says "We have never known a case that could not be cured by putting salt into soft food and giving the hens two or three meals of it. Use the salt in the same proportion as you would food for human beings."

Poults Blind

Have our first turkeys and the first hatch has four out of 16 blind. What causes this? What will prevent it? Can anything be done for the blind ones? They were hatched by chicken hens.—Subscriber, Merced.

Blindness in your stock, either chickens or turkeys, is usually due to roupy breeding stock. The only way to prevent it is to see that your eggs are from vigorous stock which has never been sick and that the male bird is not related to the females. A rundown condition in turkeys can always be traced sooner or later to the pernicious habit of inbreeding. If poults are really and entirely blind there is nothing to be done for them. If you have any doubt on this point you might try dropping a little of the ordinary boric acid solution in the eyes twice a day. Half a teaspoon of boric acid to a cup of warm water is the right proportion.—J. A. K.

Kidney Disease of Turkey

Turkey gobbler appeared droopy in morning, head turned black and in one day he died. Found rough, white coating in liver just as if it had been whitewashed.—Subscriber, Delano.

I think your gobler had what is known as visceral gout, a disease of the kidneys which is supposed to be due to a diet too rich in protein and lacking in green stuff. Death comes suddenly and the disease is not noticeable beforehand except by loss of weight. It would be well to give your flock a dose of epsom salts all round (one-half teaspoon per bird for full-grown stock), feed plenty of green food, which means all they will eat, and see that they exercise. Turkeys are quite inclined to stuff themselves with food and then loaf around in the shade.—J. A. K.

Feeding Poults

In feeding my young turkeys I give a mixture five times daily composed approximately of three parts onion tops, three parts rolled oats and wheat, one part hard boiled egg chopped together with sufficient charcoal to make mixture very dark. I keep water and granite grit before them; have no milk or alfalfa. The yard has burr clover. I try to feed enough so the crop will feel about the size of half a marble on a ten-day turk. I keep hen in coop, letting little ones run in the grass pen made of three 12-inch boards. When weather is fair I turn them out to range. They do well for eight or ten days, then get weak, have a thin white discharge, paste up behind and die in two to four days. They continue to eat until nearly dead but when examined there seems to be very little in the crop. The back part of the body seems to turn green and in some cases is swollen.—Subscriber, Merced.

I should not dare to feed as much as you are feeding five times a day. It might be all right to have the crops as full as this at night, but it is certainly too much for every meal. After I feed my ten-day-old poults I can hardly tell by feeling the crop that they have eaten anything. Two teaspoons for ten poults is enough at this age. It is a good plan to put a pinch of grit in the feed each time, then you are sure the poults eat it, which you are not if it merely stands before them. Hard boiled egg is not a very safe feed. Sometimes poults do well on it but it is hard to digest and often fatal. I would rather give dry bread moistened with milk and squeezed dry for the first feed. If I had no milk, sweet or sour, I believe I would rather take my chances with small grains (steel-cut oats and cracked wheat) or rolled oats, mixed with green, than with egg. I find cracked wheat bread when it is stale a very satisfactory food when used with the steel-cut or rolled oats. It is drier than white bread, and when chopped fine with the green stuff makes a wholesome and palatable ration. A mixture of one-third stale bread, one-third lettuce and onion tops and one-third cracked wheat and rolled oats, with a pinch of fine grit added would make a fair ration, but it lacks the animal food which you get in milk and egg and cottage cheese. To supply this lack you might after ten days or two weeks begin feeding a little liver, boiled and chopped fine. Mix it into the rest of the ration just a little at first. I do not see any use in feeding charcoal as many people do. A little is valuable as a corrective, but it has not the effect on the bacteria in the intestines that cottage cheese has nor is it necessary in digestion as grit is. I should not attempt to raise poults if I could not get cottage cheese for them. I have to buy it from the delicatessen stores, but when so little is fed it is not expensive, certainly not as expensive as losing the poults. A mixture of one-third green food, one-third cereal (grains and bread), and one-third cottage cheese, with the pinch of grit always added, makes an ideal ration, and if you do not feed too much you are pretty sure of raising your poults. I prefer lettuce and onion tops to onion tops alone.—J. A. K.

Globe Artichokes

Answering a query for information as to the growing of globe artichokes Mr. D. F. Reichard writes:

"Globe artichokes will grow on most any soil but seem to be more particularly adapted to heavy adobe. I consider planting them six feet apart better than closer. They may be grown from seed or from division of the roots. Seedlings are not always of the best varieties and the plants have to be selected as many of them will have spiny fruit which is not desirable. By using sprouts that come from the roots for resets your young plants will produce the same grade of fruit as the parent. These sprouts are taken generally the latter part of the summer when they have made at least two good sized leaves. By setting them out at this time the plant will be well established by winter and under normal conditions should produce a small crop."

Laying Out and Planning Farm

I have an 80-acre alfalfa ranch which I propose to make my home. At present there are no buildings on it. Before starting operations I wish to make a study of the proyer layout of the buildings, yards, orchard, garden, well, etc. It seems these things should be worked out and yet the office of farm management at Washington, D. C., is unable to aid me. Kindly advise through your paper what you have to offer as a solution of the problem. I expect to devote myself largely to alfalfa and stock raising.—Subscriber, Phoenix.

Of course it would be impossible to give any definite aid unless one knew the number and kind of animals, the amount of money to be invested and other essential points, but as a starter we would suggest getting in touch with the farm adviser of your county, who is James A. Armstrong, Phoenix; also with Stanley F. Morse, superintendent of the University of Arizona agricultural experiment station, Tucson. We notice in a recent issue of the Weekly Press letter reference to the work of Professor Morse and this statement:

"Many farmers are failing to 'make good' because they are continually jumping from one kind of crop or livestock to another in the hope of 'getting rich quick.' The surest way to success in farming in Arizona is to determine from the information and data available what type of farming is best adapted to one's local conditions, plan out the farm development for a series of years, and then to stick to the plan. Such a plan should take into consideration the farmer himself, the soil, climate, size of farm, market and transportation facilities and the farmer's pocketbook. It must be evipent to any one that the farmer who works along a certain definite farming plan is going to know more about the business than a farmer who changes his practive every year. The experts of the University of Arizona agricultural extension service and the agricultural experiment station are anxious to help farmers to prepare such working plans for the development of their ranches."

Cherries in Southern California

Will the cherry tree bloom and bear fruit in a climate similar to that of San Diego or Los Angeles Counties? If such a tree bore early, marketable fruit would it be profitable?—Subscriber, National City.

Of course it is impossible to say what cherries wil do under conditions afforded by these sections. We have not heard of cherry trees bearing satisfactorily in Southern California, excepting at a very few mountain localities, and we doubt not it will be many years before a variety will be found which will do well. However, we will be glad to hear from our subscribers.

FOR OUR DEAD—MAY 30.

I.

Flowers for our dead!
The delicate wild roses faintly red,
The valley lily bells as purely white
As shines their honor in the vernal light,
All blooms that be
As fragrant as their fadeless memory,
By tender hands entwined and garlanded,
Flowers for our dead!

II.

Praise for our dead!
For those that followed and for those that led,
Whether they felt death's burning accolade
When brothers drew the fratricidal blade
Or closed undaunted eyes
Beneath the Cuban or Philippine skies,
While waves our brave bright banner overhead
Praise for our dead!

III.

Love for our dead!
O hearts that droop and mourn, be comforted!
The darksome path through the abyss of pain,
The final hour of travail not in vain,
For Freedom's morning smile
Broadens across the seas from isle to isle.
By reverent lips let this fond word be said—
Love for our dead!

—Collier's Weekly.

A SOLDIER'S GRAVE.

During the civil war there was a good deal of irregular fighting—that is, the southern forces were made up of enlisted troops, aided by partisan bands, and citizens would occasionally take up arms for the southern cause. No unenlisted troops came within the province of civilized warfare, and during the struggle between the north and the south the question was constantly coming up as to the treatment of these partisans and citizens—whether they should be treated as prisoners of war or shot as illegitimate combatants.

Usually when a citizen was taken in arms, being brought before the officer in command, after a few words as to the case, he would say: "Take him away. I don't ever wish to see him again." This was understood as an order to take the prisoner away and shoot him. On one occasion when a citizen was captured and thus executed the Confederate commander on the other side of the line, taking the ground that the man who had been shot had recently been enlisted, resolved on retaliation by shooting one of his own prisoners of war.

"Take one of those two men captured this morning," he said, "and shoot him."

"Which one, general?"

"Whichever you please. I have no time to attend to trifles."

This sounds harsh, but in wartime human life is very cheap, and the responsibilities often resting upon the shoulders of a commander are a great strain upon him. The officer, not wishing to decide such a question, approached the two men, undecided as to what to do. He was not preoccupied, as was the general, by other duties. It was too cold blooded for one in his sober senses.

Then he bethought himself that he had only a verbal order for what he was about to do, and, turning, he went to the chief of staff and asked him to write out an order to shoot a prisoner in retaliation. The chief of staff rather than trouble the general with the matter consented, asking what name to insert in the order.

"Leave it blank," said the other. "I was ordered to shoot one of two men, and I shall decide which is to die by lot."

Having received the paper, Captain Claybourne, the officer who bore it, approached the men it concerned. They were sitting on the ground just outside the guard tent whiling away the time playing cards. Soldiers usually carried cards with them during campaigns as a preventive against homesickness or ennui when unoccupied.

"I am sorry to announce to you two men," said the captain, "that one of you is to be shot in retaliation for one of our men, accused of illegitimate warfare and shot by your people on the other side."

The two men looked up, for a moment not realizing what the speaker meant. When they did a slight shudder passed over both. They were Walter Treadway and Sergeant Knowlton. They had lived in the same town before the war and had enlisted in the same company, though Knowlton was ten years Treadway's senior.

"Which?" was the laconic reply of Knowlton, who first found his voice.

"That is to be decided by lot. I will

Try This Popular Recipe for Making Buckwheat Cakes

An Old Fashioned Recipe That Never Grows Old

From a little cook book compiled by one of the leading women writers of this country, on culinary subjects, we have selected the following old-fashioned recipe for making the kind of buckwheat cakes "that mother used to make." Try this recipe once, and we are sure "the folks" will demand its preservation for many future uses.

One quart buckwheat, ½ cup warm water, 1-3 cup Kingsford's cornstarch, 1 tablespoon Karo Syrup, 1 heaping teaspoon salt, 1 quart warm water, 1-3 yeast cake. Sift the dry ingredients together, soften the yeast in the warm water and add it and the Karo Syrup to the rest of the water. Mix with the buckwheat, beat 8 minutes and rise over night. In the morning add warm water to make thin enough to pour onto the griddle. Serve with Karo Syrup.

Karo Syrup is recommended particularly in this recipe, because experience has shown that as good results cannot be obtained with inferior syrups. Good dishes are often ruined by experimenting with ingredients of whose quality you are not sure. Karo can be obtained at all modern grocers. Insist upon it, and ask for the Karo cook book containing the above and hundreds of other valuable recipes.

L. ANDERSON CO., Mfrs.,
Martinez, Cal.

put a white and a dark stone in a hat. One of you, blindfolded, may draw. If he draws the dark stone he loses, if the white he wins."

Treadway was unable to speak, though he tried to say something. His companion said

"If you will permit we will play a game of seven up, the loser to die, the winner to live."

"As you please," said Captain Claybourne.

Knowlton took up the cards and dealt them. Treadway took up his hand, trembling as he did so. It required a great effort to control himself sufficiently to sort them. Claybourne stood looking on. As Treadway lost nerve Knowlton seemed to gain it. They were to play five games, the loser of three to be the loser in the game of life. While Knowlton had the self control to play the games fairly well, it was soon evident to the Confederate looking on that he was playing to lose. Once when the sergeant purposely played the wrong card Claybourne essayed to stop him, but a look from Knowlton deterred him. Knowlton won the first game: Treadway won the next three. The winner could not repress a long drawn sigh of relief, but relief accompanied by pain that his companion must die instead of himself.

Clapbourne marched Knowlton between two men to an unoccupied tent, where he suffered him to make preparations to die. The prisoner told the captain that he wished to write a letter to a girl in the north to whom he was engaged. Materials were furnished, and he wrote, stating the manner of his approaching death, making no mention of the fact that he had voluntarily given his chances for living to a companion. Claybourne received the letter, agreeing to take every precaution that it should reach its destination. Then he said to the man who was about to die:

"Were it not that my general is momentarily expecting to be slaughtered by your people I would make an effort with him to save you. When not under the strain of war he is as tender hearted as a girl. But with the welfare of his troops and the cause absorbing his whole nature he seems brutal. To intercede for you now would only accrue to my detriment and be of no service to you."

"I understand you perfectly," replied the other. "Goodby."

Half an hour later a volley was heard in a wood near by, and the body of Sergeant Knowlton was buried where it fell. Yet the volley was followed by a second—not customary in such cases—fired by Captain Claybourne's order over the grave of a soldier who has died without dishonor.

Some months later Treadway was exchanged, and, having, in addition to his shock, been ill in a southern prison, he was so disabled that he was discharged from the military service of the United States. When he reached home he was welcomed with tears by his family, while one of his sisters held him in her arms and looked at him with a strange, faraway look without tears. Presently she kissed him and went away by herself.

It was she to whom the man who had died for him had been engaged. Captain Claybourne in transmitting to her the last farewell of her lover had indorsed on it. "This man purposely became a loser in the game of life between him and his friend."

Not till after the war had ended did Treadway learn from his sister of the sacrifice in his behalf. Then he went south, exhumed the body of the man who had made it—the grave had been carefully marked by Claybourne's orders—and brought it north. After it had been deposited in its permanent resting place brother and sister for years made it an object of pilgrimage on every Memorial day. The brother, whose health had been undermined by his experiences in the south, lived but a few years. The sister, now a very old woman, contines on every Memorial day to place flowers on the grave of her soldier hero.

There could hardly be a braver act, no greater heroism, than for one, uninspired by the drum, the rattle of musketry, the boom of cannon, in cold blood—so to speak—to give his life for another. Yet today the only especial honor accorded on Memorial day to Sergeant Knowlton is the homage of the woman who inspired the act.—Credit Lost.

IDEAS FOR THE COOK.

Written for the California Cultivator By Isabel Cottle.

Breakfast

Raspberries
Calves Liver with Bacon
Baking Powder Biscuits Plum Jelly
Coffee

Lunch or Supper.

Shepherd's Pie
Baked Apples with Cream Rolls
Cream Sponge Cake Tea or Milk

Dinner.

Brown Chicken Potpie with Dumplings
Potato Puff Spinach a la Creme
Watercress and Cucumber Salad
Date Souffle Coffee

Brown Chicken Potpie with Dumplings

Select plump fowl, not too young, dress, cut up, wash and drain thoroughly. Place in kettle with about one quart of boiling water. Watch carefully, adding a small amount of hot water occasionally if needed and cook until almost tender, then remove cover and allow liquid to cook away. When nearly dry turn the pieces of chicken and allow to brown the same as pot roast. When nicely browned pour over sufficient hot water to make the desired quantity of gravy. Salt to taste. Add a generous lump of butter and thicken with flour rubbed smooth with a small amount of milk. Add dumplings, cover and cook for ten to 15 minutes without removing cover.

Dumplings.

Beat two eggs until light and add two cups of milk. Measure one cup of flour and sift with two level teaspoons of baking powder and one-fourth teaspoon salt. Stir into the egg and milk, then add enough more flour to make rather a stiff batter that will stand up on the spoon. Add two tablespoons melted butter and beat thoroughly. Drop in small spoonfuls on top of the chicken.

Spinach a la Creme.

Two pounds spinach, pepper, salt, and nutmeg to taste, two tablespoons butter, one-half cup thick cream or rich milk, and one teaspoon sugar. Wash and pick spinach, throw it into a pan of boiling water containing a little salt and soda; boil until tender, 10 to 15 minutes; pour on to a wire sieve and squeeze out all the water and cut up fine with a sharp knife. Put spinach into a saucepan, with seasoning, butter and cream. Reheat and serve.

Shepherd's Pie.

Chop one pound cooked meat, mix in two tablespoons breadcrumbs, one chopped onion, one tablespoon chopped parsley, one cup gravy, salt and pepper to taste, two tablespoons butter, one-half teaspoon powdered herbs, one tablespoon tomato catsup. Turn into fireproof dish and cover with a thick layer seasoned mashed potatoes. Brush over with beaten egg and dot with pieces of butter. Bake 20 minutes.

Date Souffle.

Stone and chop one-half pound dates and cook them in one-half cup boiling water, mashing until smooth. Add one tablespoon melted butter, stiffly beaten whites of five eggs, one-fourth cup sugar, one tablespoon lemon juice and salt to taste. Pour into buttered souffle mold and bake until brown, about 25 minutes. Serve cold with boiled custard or whipped cream.

Ants Easily Exterminated

By a Method As Simple As It Is Effective.

Even though you have tried without success many remedies for ridding your place of ants, do not despair—for a very simple yet effective method of relief is at your disposal.

Your case can be no worse than that of the Los Angeles baker, whose shop was over-run with ants to such an extent that he either had to get rid of them or go out of business altogether. After long experimenting he devised a paste which not only drove all of the ants out of his place in one day, but kept them out forever.

So great a demand was immediately created for this wonderful remedy that it was put up for general use under the name of Kellogg's Ant Paste. It can be obtained of all good druggists. Ask for a package today, and you will be surprised at the ease with which your ant troubles will be ended.

Facts About Cornstarch

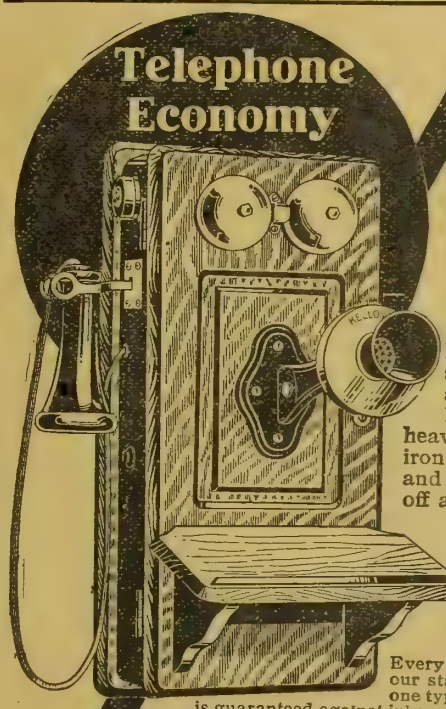
Valuable Information Regarding This Most Important Food Product

In a little cook book compiled by Emma Churchman Hewitt, formerly Associate Editor of the Ladies' Home Journal, and a recognized authority on culinary subjects, there is to be found most interesting information on the subject of cornstarch. It appears that many otherwise experienced cooks have a very limited knowledge of the possibilities contained in this delicious food product—with the result that where many cooks use cornstarch merely in the preparation of a few puddings and desserts, a thorough knowledge of its possibilities would result in their often using it a dozen times a day in all kinds of dishes.

It is important, therefore, that housekeepers should familiarize themselves with this most useful cooking ingredient—with a view to enlarging the scope of their cooking, as well as improving it.

It should be borne in mind, however, that there is a great difference in Cornstarch—and the best results cannot be obtained with inferior brands. Mrs. Hewitt states that her correspondence with housekeepers all over the country showed conclusively that those who had the greatest success with cornstarch recipes always depended upon Kingsford's.

Kingsford's can be obtained at all modern grocers, as can also a copy of the Kingsford's cook book referred to above.



THE Kellogg farm telephone will save you money because: It is carefully made of the best material. It is easy to install and simple in construction. It does not get out of order easily, and is constructed for the heaviest farm line service. It is long lived. Thousands and thousands of Kellogg telephones are now in service over ten years. It is not affected by climatic conditions; has proper insulation of all parts, heavy nickeling of outside metal; iron and steel parts are copper plated and oxidized—they cannot rust, scale off and cause short circuits.

Kellogg Telephones

Every Kellogg telephone is equipped with our standard transmitter, over a million of one type in service today. Every transmitter is guaranteed against inherent defects for five years. This phone will ring over the longest, heaviest loaded farm lines. It can be equipped with a condenser, vastly improving the service of your lines. It can be equipped with a push button, enabling you to call central secretly and call other parties without disturbing your neighbors.

"Use is the test," judging solely by the service this telephone is giving today in all parts of the world. It will give you telephone transmission superior to anything on the market. It is the master telephone.

Write today for our bulletins describing in plain language just how the Kellogg telephone will do these things for you. *Write for Bulletin 24.*

Citrus Fruit Market

LOS ANGELES, May 26, 1915.

Immense quantities of strawberries and other small fruits are filling the market, and this in addition to the large quantities of oranges which have been going forward has induced a slight sagging in demand. However, fair prices are still obtained. Good stock is receiving much more attention than the lower grades, especially of Seedlings and Sweets. There are very few Navels yet to go and from this time on Valencias will have to be depended upon.

Immense quantities of lemons are coming from Mediterranean ports. It is barely possible they will be used as ballast for large vessels coming to this country for ammunition for Italy which has now entered the war. The first requirement of the lemon market is hot weather and that has not been given for the last few weeks.

Shipments

Shipments of oranges to date from Southern California since November 1, 1914, 25,017, lemons 3,682, total 27,699. To same date last season; oranges 26,458, lemons 1,476, total 27,934. From Tulare County; oranges 5,396, lemons 197, total 5,593. To same date last season; oranges 5,183, lemons 30, total 5,213. From Northern California; oranges 628, lemons 2. To same date last season; oranges 404, lemons 5.

NEW YORK, May 24.—Forty-four cars navels, two Valencias, six St. Michaels, two seedlings, one sweets, one bloods, twenty mixed cars, and six cars lemons sold. Oranges, 10 to 20 cents lower. Lemons, 15 cents lower. Raining.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Rupture

Mare foaled on May 1st. During the last week of carrying the colt she became ruptured. What caused this? The rupture is not bad, just a swelling about an inch over a space as large as a saucer. How soon can she be worked? Would it be safe to breed her again?—C. A. N., Paso Robles.

A direct injury is usually the cause of a rupture in a grown animal. Feed her very sparingly to relieve the pressure and the rupture may disappear. Do not work her until the swelling has entirely disappeared. It may do no harm to breed her again. Usually ruptured mares carry a foal all right.

Indigestion-Dyspepsia

Colt two months old chews boards. Can you tell me cause and remedy? —Subscriber, Linne.

Feed the colt smaller quantities at a time and feed it oftener. Add half a teaspoon of phosphate of lime to the feed twice a day. Also put some good hay where it can reach it.

Losing Blood

Mare seven years old is losing blood from vagina. She aborted after six months' gestation.—Subscriber, Escondido.

A physical examination by a veterinarian would be necessary to determine the cause. He could probably treat it for you all right.

Garget

What treatment do you recommend for garget?—Subscriber, San Jose.

To relieve the cows of garget; mix six pounds of Epsom salts, three pounds common salt and eight ounces powdered nux vomica. Give each cow a large handful once a day. Also get six ounces tincture of aconite and give each cow a teaspoon once a day in a little water. This will thin the blood and help to relieve the pressure in the udder. Bathe udder with hot water and rub them carefully with the hands morning and evening and milk out all you can get. Reducing the feed and giving plenty of water to drink will also help.

BLACKHEAD

(Continued from Page 617)

the kind of food they need. Grit should be kept always before them. The ration given these poults would have been all right if they had not been fed too much. It is possible too that they had lice or were allowed to run on wet grass or in the rain. Overfeeding, lice and dampness are the three enemies from which poults must be carefully guarded.—J. A. K.

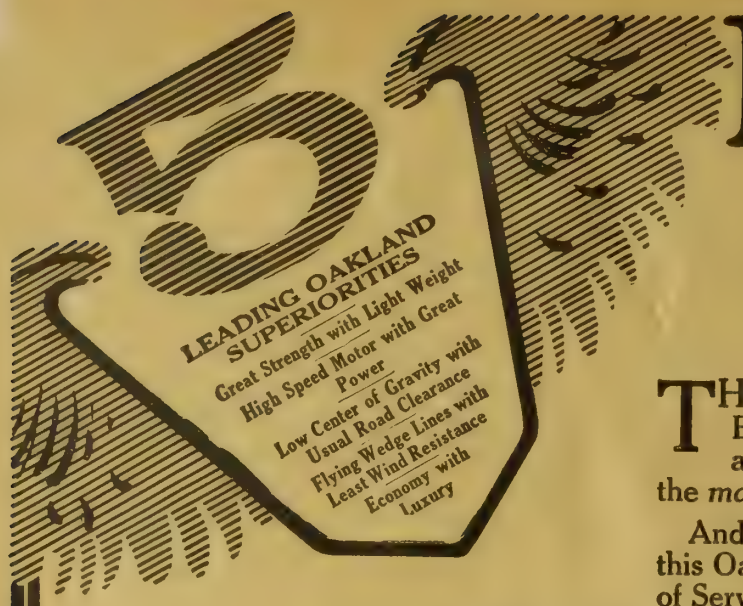
FINE SERVICE

This country was recently visited by a party representing the Chinese government, made up of men of affairs in China. The party investigated as to trade conditions in America and as to possibilities of larger relations between that country and the United States. At Los Angeles the party was taken in charge by the Southern Pacific Railway and the members of the commission were taken directly to New Orleans. On arrival there a telegram was sent by the commission to Passenger Traffic Manager Fee, as follows:

"Arrived on schedule after fastest run ever given train over Sunset Route. Service perfect, and on behalf of our honorable commissioners of China and associated chambers of commerce. I desire to congratulate your company not only on account of splendid hauling but attention shown by every employe in assuring comfort, safety and convenience of entire party."

Secretary John J. Ferguson of the United States Live Stock Sanitary Association, Union Stock Yards, Chicago, is mailing the annual report of the association. Its price is one dollar.

Keep the flower-beds out of the lawn. Grass is at its best when not broken by patches of plants.



Reconstructing Car Values

THE order was: "Build a new Oakland Four. Build it to a new standard of Quality and Service—at a new price. Build a Four which is more than ever the *master* of any hill or road task."

And now after months of planning and building and testing, this Oakland is ready for you—a New Model, a New Standard of Service—every inch a Monarch of Fours!

"Make it extra *powerful*—for power has been a big asset in building up the new Oakland prestige."

"Build it *light*—so it will be easy on tires and fuel."

This new Oakland has surplus power—not an ounce excess weight.

"Make it *durable*—our reputation is based on *sturdiness* with simplicity."

"Build it with low center of gravity, for extra safety and smooth going." The new Oakland hangs to the road true and steady, yet has the usual road clearance.

"Make it *comfortable* for five—no crowding."

So—while this Oakland has the air of having been designed for brilliant dashes of speed—it is made to last and do real *plugging* service—and the "comfort" order was carried out to the letter.

"We are going to sell the new Oakland Four for $1050."

With Oakland standards of uncompromising quality this means only one thing—*volume*.

The essentials which round out this car are—four-cylinder Oakland-Northway high-speed motor, 39 h.p.; Delco electric starting, lighting and ignition system; Oakland Stewart gasoline vacuum feed; comfortable roominess for 5 passengers; also one-man top; crown fenders; extra rim; speedometer. In short, *complete* equipment.

This new 1916 Oakland is now ready for delivery. Other important additions to the 1916 Oakland line will be announced soon.

Armies Must Have Hay

Many Shiploads Will Go to Europe. Farmers Advised to Plant Heavy Forage Crops. Farmers' Notes Taken in Payment for Seed.

Every sign says to the farmer, "Plant all you can of some good drouth-resisting forage crop."

Our hay this year must feed the livestock of Europe as well as our own. This should mean a huge demand for hay.

Besides, already in large sections of America the weather is too dry. This is bad for hay that is not drouth-resisting. Good drouth-resisting hay should make splendid money for every farmer this year.

Money in Sudan Grass

Sudan Grass is a sure drouth-resister, yielding plentiful choice hay through the driest season. It yields more tons to the acre than any other forage crop—three to ten tons per acre. First cutting, fifty to sixty days after planting. Additional cuttings every thirty to forty days till frost kills dead.

Follow Small Grains With Sudan

After your wheat or oats are off, if it is not later than July 25th, you can plant the stubble to Sudan Grass and get a good hay crop before frost. Take two crops from your land this year.

Pay for Your Seed With Note

If you will plant ten acres to Sudan Grass, I will supply you with a liberal quantity of seed and accept your four months' note for $20.00 in settlement for the seed.

How to Pay for Seed With Hay

If you will plant forty acres or more, I will supply a liberal quantity of seed for planting at the rate of $1.75 an acre, accepting your four months' note in settlement, and will buy sufficient of your baled Sudan hay to pay for the seed, at $15.00 a ton, delivered at your nearest railroad station.

The Agricultural Department has declared that Sudan Grass is the best forage crop known. I am the biggest grower of Sudan Grass in America, and believe it will bring millions of dollars to the farmer. I know it is so good that I am making you this extraordinary offer. I am negotiating for army hay contracts. I recently wrote a book entitled "SUDAN GRASS—ITS HISTORY, USES AND METHODS OF CULTIVATION." It gives just the information you should know. I will send it free if you ask for it.

The seed I will ship is of the very highest class, and a certificate of inspection signed by the State Experiment Association, vouching for its purity and freedom from all other grasses and weeds will accompany the shipment.

If you prefer to pay cash for seed, I will allow you a discount of 5% providing payment is made within five days of receipt of seeds.

Please write me at once, stating whether you will pay cash or give a note. If the latter, then give number of acres you will agree to plant. State whether you own your own farm and give references. Promise to give me your four months' note in settlement, and I will ship seed at once, and send note for your signature. Act quickly. Planting time is on us, and I have only seed enough to plant 20,000 acres.

DAVID B. CLARKSON
P. O. Box 561 Robstown, Tex.

Not Acreage But Production is the True Measure of Profit

Profit is the difference between what your crops cost you and what you get for them. The ratio is the same whatever the acreage of the farm.

The farmer who can cut down cost and increase production is the one who will make the most money on his investment.

G-E ELECTRIC MOTORS FOR RANCH AND FARM

will positively accomplish the following results:—

Save loss from drought and increase crops by supplying steady, dependable power for irrigation.

Save labor by driving farm machinery formerly worked by hand.

Save repair bills—owing to their simple, sturdy construction, G-E motors operate for years without getting out of order.

Save time,—G-E motor-driven machinery does job or "chore" in a fraction of the time taken by slow hand methods.

Ask your local power company to demonstrate what electricity will do for you in the house, dairy, barn and field.

General Electric Company

Los Angeles Office:

Vol. XLIV No. 22 LOS ANGELES: THURSDAY, JUNE 3, 1915 One Dollar Yearly

Dairying in an Orchard

Dr. Leroy Anderson Writes for Cultivator Readers of a Plan for Securing Greater Profits on High Priced Orchard Lands. It Expenses Can be Made by Producing Milk and Butter There are Abundant Profits in Manure and Wastes

A SERIOUS problem with most orchardists is securing supply of fertilizer and humus needed for profitable fruit production. It is quite generally conceded that the best source of this supply is in the form of stable manure, but how to obtain it is another question. An illustration of producing it on the ranch is found on the Sorosis Fruit Farm in Santa Clara Valley, where a dairy was established in June, 1911, by the manager, Mr. Frank Abernethy. Sorosis Farm comprises 250 acres of which all but ten or twelve acres are in fruit; 185 acres are in bearing prunes and the remainder are peaches and apricots. The story of the dairy, how it is equipped and managed and the results therefrom is of interest to all fruit growers.

Equipment

The chief structures consist of a milking barn 30 feet by 120 feet, two hay sheds with feeding racks each 40 feet by 50 feet, a concrete silo 16 feet by 30 feet, and a concrete reservoir 8 feet by 16 feet by 14 feet to hold liquid manure (capacity 13,000 gallons). These are located in a eucalyptus grove on the bank of El Quito Creek and with surrounding corrals occupy about four acres of land. The well equipped milk room is in the tank house near the manager's residence.

The machinery or power includes a gas engine and No. 3 centrifugal pump for emptying the reservoir and a blower, cutter and engine for filling the silo.

The milking barn has a capacity of 70 cows. The floors are of concrete with gutters draining to the reservoir situated about 20 feet from the barn. Since the barn is on a side hill the reservoir is only about one-half below the surface of the ground and has a wooden cover. The manure spreader is so placed that its top is below the floor level of the barn.

The buildings are of simple but substantial construction. Carpenters were employed only for framing the barns and all the rest of the work, including concrete, was done by the regular men employed on the farm at $1.25 per day and board. The lumber was purchased in San Francisco at $12 per thousand but a good grade of shingles was used for the roof.

Cows

An average of 40 head is kept in milk throughout the year. This means a total of 50, counting dry cows and a few heifers about to calve. The cows are grade, showing Jersey, Holstein and Shorthorn blood. For the first three years a registered Jersey bull was kept, but for the last year a Holstein has been used with the idea of changing to the latter type in order to secure a larger flow of milk. The herd is kept up by rasing a few heifers from the best cows and by buying a good cow now and then. A milk record is taken of each cow twice a month by weighing the yield for two 24-hour periods.

Heifer calves that are raised for the herd are fed whole milk from four to six months, after which their feed is the same as the milch cows except for grain. They run in the corrals and do most of their eating when the aged cows are being milked. Bull calves and heifers not desirable to raise are vealed by feeding on whole milk for four to six weeks. However, if milk is scarce such calves are sold at a very few days old to someone who raises them. Pasture may be hired on ranges surrounding the valley, but the manager considers it cheaper in the long run to keep the heifers with the herd. Then he knows they have good care; knows when they are bred and what to, and he is sure to have them handy at calving time.

The average daily production for the cows in milk is from two and one-half to three gallons. Various tests at the market end have shown the milk to contain five per cent fat.

Feed

Silage is made of pea vines purchased at canneries about the bay. The vines cost $2 per ton, f. o. b. cars at Sorosis, as the farm is located on the electric railway. The vines are then run through the cutter and blown into the silo. They are available about June first, and from that date until usually January, pea vine silage is a main cow diet. It is fed in the milking barn, while the cows always have access to alfalfa hay outside.

Pasture is provided in the orchard usually during January, February and March. Early in the fall barley, Canadian field peas and German vetch are sown and this is ready for feeding in January. In 1915 the cows had this for the major part of the first three montths. German vetch was not used this year because the seed could not be obtained; but it is the variety preferred on account of its larger growth. A single barbed wire is stretched around each orchard and stapled to the trees. This serves to keep the cows in and is easily taken up when plowing season opens. When pasturing, the cows are out three hours daily, one and one-half hours each morning and evening after milking. Sorosis soil is gravelly in its nature and seems not to be injured by the cattle. There are times when even it is too wet and then the cows are kept off. The trees are so large that no damage to them results from the cow contact.

One block of prune trees was sown to alfalfa in the spring of 1914. The rows of trees are twenty-five feet apart, and a strip ten feet wide, midway between rows, was sown to alfalfa. This now (May) is in a beautiful stand and has been cut once. It is used as a soiling crop for the cows. Tree cultivation is done on the seven feet on each side of the row by a single horse. It is plowed twice —first toward the trees and later away from the trees and toward the alfalfa, where a ridge is left to aid in keeping irrigating water on the alfalfa. Water is supplied from a deep well at the upper corner of this block of trees. It is too early to tell the effect of such alfalfa cultiure upon the trees, but at the present writing they are looking splendidly and are carrying a good crop. No trouble was experienced in harvesting the 1914 crop by properly timing the irrigation and cutting of the alfalfa.

Alfalfa is the staple hay fed and is in the sacks daily. It is purchased loose from alfalfa fields near Santa Clara, which necessitates a haul of six miles. One man with four horses and a trailer wagon hauls from five to six tons at a load. Since the major part of the hauling is done in the summer when team work is slack in the orchard, the cost of hauling is counted to be the wages of the man. Hauling and unloading into the sheds costs about 50 cents per ton on this basis. Second and third cuttings of alfalfa are purchased and taken from the cocks in the field.

Grain is fed when the dairy is most in need of increasing the milk supply and in cold, wet winter weather. The chief standbys are cocoanut oil meal, dried beet pulp, and rolled barley when not too high.

Handling Manure

The liquid, with all washings from the stable floor, runs into the concrete reservoir, which is thus filled about three times each month. When full it is pumped out by the No. 3 pump stationed on top and distributed in the orchard through surface irrigation pipe. The reservoir has been in use a year, and previous to its construction the liquid was run into a tank on a truck and thus hauled into the orchard. In the four years of the dairy, some eight to ten acres of orchard have been supplied with liquid manure.

Solid manure from the stables is placed immediately into a spreader, which is emptied onto the orchard at least once a week, and during the summer twice a week.

The corrals are cleaned three or four times a year, when convenient to put all hands at the job. The manure is placed in the orchard where the trees seem to be most in need of assistance. Since there is so little straw in any of the manure no difficulty is encountered at any season, either in working the soil or harvesting the crop.

Pigs

Five brood sows are kept, from which two litters of pigs are raised each year. The pigs consume garbage from the boarding house and skimmed milk from the sale of cream. The young pigs are sold as soon as weaned, the demand from the neighborhood being so brisk that sometimes purchasers will scarcely wait till wean-

THE OLD RELIABLE

San Dimas Citrus Nurseries, Inc.

Citrus Trees Exclusively **San Dimas, Cal.**

OPENING OF

Leffingwell Heights Lemon Land

Here's your opportunity to buy real choice Lemon Land, in the highly favored Whittier-La Habra citrus belt. This fine rich land adjoins the famous Leffingwell Grove, that in 1913—the year of the big freeze—yielded a lemon crop of over $500 net profit per acre. This was in 1913, the test that distinguished the real from the so-called Lemon Land.

You will remember that many so-called citrus sections had to quit that year. And that the Whittier-La Habra lemon and orange groves came out, wearing a beautiful bright green, in bold contrast to the general dull, dead brown of less favored sections.

Why take chances with far out, exposed lands, when you can get your choice of the cream of sheltered lemon lands at the opening price of $500 per acre (net acreage) with ample water, delivered to highest point on each tract.

Leffingwell Heights lies in a beautiful valley, sheltered against harsh winds, by the Puente Hills. Only 16 miles to Seventh and Broadway, the heart of Los Angeles, via Whittier Boulevard, Pacific Electric or main line Santa Fe Railway.

Here's YOUR opening to break away from your limited and uncertain income. Get five or ten acres of this choice land now at the opening price. Have it set to lemons, avocados or valencia oranges and get a good income for life.

Automobile excursions every morning at ten o'clock. Write, phone or call and make reservations.

Citrus and Tropical Fruits

CITRATE OF LIME

By H. P. D. Kingsbury in Redlands Facts

ONE of the most important products of the lemon is citric acid. This is the acid which imparts its acidity to the juice. It is a pure fruit acid, and the lemon is its source. It is largely used, and up to this time is the only product of commercial importance produced from the inside or juice of the lemon. This acid is made in this country in the larger eastern cities from the raw material, which is called citrate of lime or calcium citrate. Little if any of the pure acid is produced in California, the efforts of the lemon products manufacturers being confined to the production of citrate of lime, which is shipped east and there refined into the pure citric acid.

Lemon oil is made from the peels of the same fruit, the juice of which produces the citrate of lime, and the two operations are carried on in the same plant at the same time, thereby using up practically all of the fruit.

Outside of the amount of lemon oil and citrate of lime produced in California, the whole supply is imported from the Mediterranean countries.

Citrate of lime is an intermediate product between the raw lemon juice and the refined citric acid. It is a white powder, with no particular taste, and the standard quality is capable of producing 64 per cent of its weight of citric acid when refined.

The method of manufacture is carried on as follows: To four pints of lemon juice or any multiple of this quantity add four and a half ounces of finely pulverized calcium carbonate, increasing the amount of calcium carbonate in proportion to any increase in the amount of lemon juice. Heat the juice to its boiling point, and add the calcium carbonate slowly. Effervescence will take place, and the calcium carbonate should be added until this effervescence ceases. The effervescence is caused by the chemical change produced, which causes carbonic acid gas to be given off. A whitish precipitate will now be found, which is the citrate of lime or calcium citrate. The liquid is now drawn off and discarded, the precipitate is collected and washed with hot water until the filtered water passes off colorless. The precipitate is then carefully and thoroughly dried, and is packed into suitable containers, casks, for shipment.

Calcium carbonate is merely pure lime-rock. Chalk or bolted whiting may be used. The Crestmore quarries produce a lime-rock which is over 99 per cent pure, and which, when pulverized is exactly suited to this purpose.

The important things to watch in making citrate of lime are, first, to treat the lemon juice promptly after squeezing it from the fruit and before any fermentation sets in, second to see that the citrate of lime precipitate is thoroughly washed, third, and this is the most important, to see that it is thoroughly dried. If made in this way, the standard of 64 per cent citric acid content will be attained by the product.

A by-product of this operation as was noted above, is the effervescing carbonic acid gas, and this may be used, if led off through a pipe, for the purpose of making bicarbonate of soda.

As to the yield and cost of citrate of lime, a ton of cull lemons will produce, with adequate pressing facilities, about 90 gallons of lemon juice, or some 750 pounds. This juice should run about 7 per cent citric acid content, so that there will be some 52½ pounds of citric acid in this amount of juice. As the citrate of lime standard is 64 per cent citric acid, we shall have some 82 pounds of citrate of lime to the ton of fruit. This same fruit, on extracting the essential oil of lemon from the peels will also produce about eight pounds of oil of lemon.

The cost of production of the citrate of lime is as follows, when made in large quantity, handling say 20 tons of fruit in a day: Fuel, $2.00; water, 20c; lime rock, $3.70; packages, $4.15; freight east in car lots, $14.00; labor, $21.00; fruit at ½c per pound, $200.00; power, $1.50; peeling cost, $30.00; a total factory cost without the "overhead" of $275.55. This quantity of fruit will produce some 1640 pounds of citrate of lime, and the cost is therefore 16 8-10 cents a pound delivered east. But we have left on hand the peels of this fruit, which will produce 160 pounds of oil of lemon. The additional cost of making this oil from these peels is as follows: Labor, $7.00; fuel and power, $8.63; supplies, $1.10; packages, bottles, $7.50; freight east in small lots, $7.25; chemicals, if the solvent method of extraction is used, $62.50; making a total cost for the oil, without the "overhead," of $93.98.

The citrate of lime and the lemon oil then have cost $369.53 to produce and pack and deliver east. The average price for the citrate of lime of standard quality—not the war-time price—is 14 cents per pound delivered east, and the present price for lemon oil is $1.50 per pound. Therefore, these products which have cost $369.53 will bring back $469.60, a profit of $100.07, after having paid ½c per pound for the fruit. From this must be taken the overhead expenses of operating, the office expenses, etc., and if the balance is distributed among the growers they ought to get about five-eighths of a cent per pound for their cull lemons, much better than to throw them away.

The lemon oil market fluctuates, but may be considered low at this time, and the citrate market at the present time is abnormally high. The average returns then should be somewhat better than under the above scale of prices. The foreign competition is strong on both of these products, as the Italian government is helping the producers of lemon oil and citrate of lime to control the market. Over five and one-fourth millions of pounds of citrate of lime were imported into the United States in 1911, and nearly half a million pounds of lemon oil. This is about the average amount imported under normal conditions. There is a duty of 10 per cent on lemon oil, and also a small duty on citrate of lime imported into this country.

ADVERTISE FRUIT

The citrus production of Florida is increasing by leaps and bounds. Demand must be made to keep pace with the increasing supply.

There is just one way by which to make markets for the coming citrus crop of Florida—by intelligent advertising to develop wider use of our oranges and grapefruit.

The Florida Citrus Exchange foresaw present conditions some years ago and began to plan for taking care of the future. It has been the only aggressive force in the work of increasing the demand for Florida oranges and grapefruit.

There have been remarkably good results considering the limited amount of money the Exchange has had for this educational work. It has been proven that there may be made ample demand at good prices for all fruit that can be grown in the state. Join the Exchange!—Advertisement of Florida Citrus Exchange, in Florida

GRAPEFRUIT CROP

We have small branch taken from pomelo tree on the ranch of W. L. Whepley, Lemon Cove, Tulare County, which indicates there will be an immense crop of fruit another year. "Clusters" of these fruits aggregate a dozen or more and there are many clusters on the tree.

Mr. Whepley writes that these branches are from grapefruit trees three years old, of which he has five and a half acres. Heretofore most of the fruit has been cut off. This year but a small quantity will be left, giving the trees opportunity to grow more stocky. During the 1913 cold snap the trees escaped comparatively unharmed.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Will

Can a woman will all the property that stands in her name to her children or does the husband get part? If a woman having property in her own name dies without leaving a will can the children claim it all? If the husband dies before a final settlement of the deceased wife's property can his children by a former wife claim the property that would have come to him from his wife's estate?—Subscriber, Covina.

The wife has the absolute right of disposal by will of all of her separate property which she can dispose of to her children or to anyone else whom she may desire. If the property, although it may stand in her name, is in fact community property, the husband and heirs of the husband are entitled to it and will by the wife is ineffectual.

In the case of a woman dying without a will her separate property must be distributed, in the case of husband and one child living, one-half to the husband and one-half to the child; in the case of husband and more than one child,—one-third to the husband and the remainder in equal shares to the children or issue of any deceased child.

The rights of all heirs of a person are crystalized at the moment of death; therefore, although the husband may die subsequently and prior to the distribution of the estate, his heirs may assert the rights which the husband had at time of the death of the wife. In such case children by a former wife would inherit equally with the children by the second wife of the one-half or the one-third, as the case may be, of the separate property of the estate of the wife.

Moving Fence

A rented farm four years and bought six bales of barbwire to fence some brush and for pasture. Has he the right to take the wire when he leaves the place?—Subscriber, Solvang.

A tenant may remove, from the premises he rents, at any time during the continuance of his term, anything affixed to said premises for the purpose of trade, manufacture, ornament or domestic use, if the removal can be effected without injury to the premises, unless the thing has by the manner in which it is affixed become a part of the premises; therefore, during the period of your lease, it would seem that you would be entitled to remove a barbwire fence.

Tenant Refuses to Pay

What protection have owners of rental property against tenants who won't pay their rent after the first month's possession and won't get out when notified in writing to do so? If I am obliged to wait 30 days without getting rental shall I then send a constable to put them out without further parley?—Subscriber, Los Angeles.

A tenant of real property for less than life is guilty of unlawful detainer when he continues in possession after default in the payment of land pursuant to the agreement under which the property is held, and after three days subsequent to service of notice in writing upon him requiring payment of the rents and stating the amount due or demanding possession of the property, if he does not move at the expiration of the three days, it is necessary to bring a suit, which is entitled to a very early hearing; in such suit the court is entitled to award a judgment in favor of the plaintiff that the sheriff put the tenant out of possession of the premises and that the defendant pay the plaintiff three times the amount of rent found due.

Overcharge

I shipped grapes through cooperative association which also supplied me with shook. The association retained $41 more than should have been collected for the shook delivered. Is it legal for them to do so? How can I collect the $41.00?—Subscriber, Acampo.

Unless there is something in the by-laws or articles of the association to the contrary, it stands in the same position as any individual who retains money that belongs to its principal. The principal has an action against its agent for the recovery of the monies so detained by it.

Road Right-of-Way

Some years ago I bought one-half interest in a ranch and finally purchased other one-half. Now I find I have no way of getting out. This was a piece of a Mexican land grant. It is about one-half mile from county road. I have tried to get a right-of-way across another portion of same grant, but can only secure a right for a year with a continuance not fully granted. It will cost me $800.00 or $1000.00 to build road. Is there no way for me to secure an outlet?

A right-of-way of necessity arises in favor of grantee over the land of the grantor. When grant of the land is made, which is wholly surrounded by other land of the grantor or partly by the land of the grantor and partly by the land of a stranger, this is the general rule of the common law.
It is quite probable that you would have an action against the parties who sold the land to you for the expense to which you might be placed for procuring the right of way.

Deciduous Fruits

SUMMER PRUNING

Written for California Cultivator
By Sacramento Valley Contributor

SUMMER pruning of young trees, particularly those one or two years old, is coming to be a common practice in some sections of the Sacramento Valley.

The theory is simply this. With a rich soil and an abundance of moisture young trees have frequently made as much by the middle of the summer as would ordinarily be made in a whole season. Instead of permitting this growth to continue until the branches are "whips" six, eight or ten feet long, they are pruned in June, cutting back for a strong head just as would be done with an ordinary tree, and the growth for the balance of the season forms the framework of what would otherwise be the growth of one year later. In other words, the framework and branches for two years growth are formed in one season.

The idea is to take advantage of the growth made by the tree in such a way as to eliminate as much as possible the waste of wood in pruning. Some wood must of necessity be taken off, but all that can be put into the permanent branches of the tree, without seriously checking the growth, is a distinct gain.

A horticulturist and fruit grower from an Eastern state recently visited a young Sacramento Valley orchard. On the way to the place it was remarked that what was considered a good job of summer pruning had been done. Without waiting to see the trees the visitor remarked, "I am absolutely opposed to summer pruning. It always stunts our trees and gives them a setback from which they do not recover before another season. They do not make much more vigorous limb growth after the pruning, but frequently send out weak shoots and fruit spurs which we do not want on our young trees."

Nothing more was said on the subject until the prune orchard was visited, and here were seen fine specimens of trees with a double tier of branches. There were some fruit spurs, but they could easily be taken off with the winter's pruning, and all that was necessary to be done with the new limbs that form after June or July—when the summer pruning was done—was to shorten them in, take out interfering branches and thin out the centers a bit.

But when the pears were visited there came the most enthusiastic praise of the practice and the remark that "Under these conditions of soil and moisture summer pruning is certainly the only practice. In fact, this is the best "heading" I have ever seen on a Bartlett pear, continued the visitor.

It is possible by carefully cutting to outside buds to form a beautiful open vase shaped head on the pears, at the same time making the branches short and strong so as to hold up the heavy loads of fruit the trees are expected to bear.

One pear grower who has a young orchard planted on very rich river bottom land summer pruned all of his trees this year but three short rows. In this block all of the trees were planted in March, 1914, and the summer pruning was done in July. The trees were pruned just as they would have been this winter if nothing had been taken off. On the pruned trees there is a fine two-year old head, while the unpruned ones grew such a rank growth of willowy limbs that some of them literally broke down in the wind before the end of the growing season and all of them must be cut back to the same length of limb as were those that were pruned in July. Of course the limbs are larger on the unpruned trees than they were on the others in July, but the total amount of wood left after this winter pruning will be much greater on the July pruned trees.

Two years ago on another orchard summer pruning was done, but the pruner was afraid that too much of a check would be given the tree by taking off the large percentage of the leaves that would be necessary if the limbs were shortened back to twelve to eighteen inches, the length of limb required for the first branches. Consequently the tops were merely shortened back a foot or so, leaving limbs three to four feet long. But this proved to be a mistake. The branches simply came out at the ends of these willowy limbs and the following winter the whole top had to be cut back to three or four limbs twelve to eighteen inches long. Now, this pruner cuts back in June or July to the permanent length of limb.

It has also been found to be a mistake to wait too late in the summer to do the pruning. If the trees get a good start in the spring the work can be done in June and early in the month at that.

In order to see how far summer pruning could be carried one prune tree was pruned every time the limbs reached a length of twenty inches or so. They were then cut back to about fourteen or sixteen inches. Four decks or sets of limbs were grown in one season, but this is rather too much of a good thing. Undoubtedly the tree will come out all right, but now all of the limbs are quite small in circumference. On many strong, growing trees, however, it would seem quite feasible to make two cuts during the summer instead of one, or produce three tiers of limbs instead of two.

For the man who loves trees and studies them and lives with them there is much of pleasure and profit to be gained in the orchard business in the Sacramento and San Joaquin valleys of California.

WHEN TO SPRAY FOR CODLING MOTH

In response to inquiries as to how many sprayings should be given for the codling moth, Dr. A. L. Melander, the entomologist of the Washington experiment station, suggests that sprayings be repeated as long as their cost is exceeded by the increased returns they assure. To expend a dollar in spraying in order to save 50 cents worth of fruit may generally be considered economically a poor policy.

It is undoubtedly true that many orchardists spray more times than is necessary, that they get less than a dollar return from a dollar's spraying. It is equally true that more orchardists do not spray enough, that it would pay them to invest more in their spraying. When the successful man sprays three times and the unsuccessful man four times, it seems paradoxical to state that the former has sprayed too much and the latter too little. An analysis of the reason for the latter's failure will most likely disclose two violated factors, the most important features of codling moth spraying; an incomplete calyx application and incorrect timing of the later sprayings.

Spraying for the codling moth should not be left to any convenient time, as it is definitely determined by certain periods in the life history of this insect. The spray is an arsenical poison that is effective only when eaten by the newly hatched worms. To give a spraying when worms are not hatching means a practical waste of material. Hence the importance of correctly timing the applications. A thorough wetting into every flower at the first spraying persists in its effects throughout the season and reaches the majority of the worms. As no other spraying does this the importance of thoroughness of the first application can scarcely be overstated.

The first spraying for the codling moth is given as soon as the blossom petals have fallen. The second spraying follows a month or six weeks later, at which time the first orchard worms are entering the fruit. These tiny worms are produced by moths which have practically all passed the winter in the ground in the shape of last year's cocooned worms. As the ground temperature is approximately the same year after year, irrespective of the earliness or lateness of the season, the date for the second spraying can almost be stated by calendar. The first of June at North Yakima will time the second spraying as well as is accomplished by the usual breeding cage observations. This date, of course, would change with other locations.

The early worms must feed in the apple, cocoon, emerge as moths and produce eggs before the appearance of the second generation of worms makes a third spraying necessary. This date can readily be determined by trapping the first generation of worms in strips of burlap fastened around the tree trunks. The cocoon, moth and egg stages together require about six weeks, placing the date for the third spraying at North Yakima at about the third week in July. Other localities will vary according to climate. The effect of this external application of spray wears off in a month, at which time a fourth spraying may be given. For late apples a fifth application may be desirable during September.

These five applications do not all have the same value. The first spraying can be given so as to be worth more than all the others combined. If thorough, wetting into every blossom, this spraying has time and again protected the crop. If poorly given, no amount of later spraying can make good the neglect.

To test the effectiveness of the first sprayings some trees should be banded and a close watch be kept for wormy fruit when thinning. Obviously if such tests disclose many worms later sprayings should not be omitted, but it should be equally obvious that if these sprayings have annihilated the first brood of codling moth little danger from a second brood need be feared.

CHERRIES INJURED

The late continued rains did enormous damage in early cherry producing sections of California. The fruit was just in that state of ripeness which caused it to crack and even decay on the tree. The later crop is coming through in fine condition.

In casting your bread upon the waters, don't wait until it gets so stale you have no further use for it.

North Fork, June 28.

I have just returned from a visit to the mountain centers. Prof. T. F. Hunt made the trip with me and lectured to the different centers on "Control of Insects and Diseases in the Orchard."

During June Miss Lillian D. Clark will speak at the several mountain centers in the interests of womens' clubs. Two more clubs have been organized as an auxiliary to the farm bureau, one at Coarse Gold and one at Oakhurst.

San Diego County, H. A. Weinland, Adviser, San Diego

Fallbrook, Wednesday, June 2.

Mission Valley, Thursday, June 3, special meeting in the evening with Prof. Bryant of University of California.

Bonsall, Friday, June 4, Regular meeting in the evening, Prof. Bryant attending.

San Diego, Saturday, June 5, 11:00 A. M. Chamber of Commerce. Regular monthly meeting of the directors of the county farm bureau. 2:00 P. M. meeting of ranchers interested in the formation of Winter Vegetable Union.

Encinitas, Monday, June 7, Regular farm bureau meeting held at Olevenheim Colony.

San Pasqual, Tuesday, June 8, Special meeting 2:30 P. M. at the creamery, Prof. True of the dairy husbandry division of the university being present. Discussion of the formation of a cow testing association.

Ramona, Wednesday, June 9, 7:30 P. M. regular farm bureau meeting, Prof. True attending.

Lakeside, Thursday, June 8, 7:30 P. M. special meeting of dairymen interested in the formation of a cow testing association. Prof. True will be present.

Dehesa, Friday, June 11, 7:30 P. M. regular farm bureau meeting. Prof. True may attend.

Alpine and vicinity, Monday and Tuesday, June 14, 15, Meeting Alpine Monday P. M.

Poway and vicinity, Wednesday and Thursday, June 16, 17, Meeting Poway Wednesday P. M.

Spring Valley, Friday, June 18.

Nestor and vicinity, Monday and Tuesday, June 21, 22, Meeting Nestor, Monday P. M.

Otay and vicinity, Wednesday and Thursday, June 23, 24, Meeting Otay, Wednesday P. M.

Jamacha, Friday, June 25.

Potrero, Monday, June 28, Meeting Potrero Monday P. M.

Campo, Tuesday, June 29, Meeting Campo Wednesday, June 30.

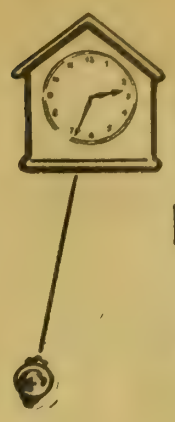
PAINT ADDS BOTH TO APPEARANCE AND SERVICE

All buildings and appliances on a poultry farm will be improved greatly, both in appearance and in serviceability by the addition of paint. One may buy ready-mixed paints or may purchase paste pigments and oil and mix them. All surfaces should be clean and dry before they are painted. Use a priming coat made of equal parts of paint and linseed oil and cover with one or more coats of paint, which should be thoroughly rubbed into the surface.

Whitewash is the cheapest of all paints and may be used either for exterior or interior surfaces. It can be made by slaking about ten pounds of quicklime in a pail with two gallons of water, covering the pail with cloth or burlap and allowing it to slake for one hour. Water is then added to bring the whitewash to such a consistency that it may be applied readily.

A weatherproof whitewash for exterior surfaces may be made as follows: (1) Slake one bushel of quicklime in 12 gallons of hot water; (2) dissolve two pounds of common salt and one pound of sulphate of zinc in two gallons of boiling water; (3) pour (2) into (1), then add two gallons of skim milk and mix thoroughly. Whitewash is spread lightly over the surface with a broad brush.

Mr. Elwood Mead, formerly engaged in irrigation investigations for the United States department of agriculture, and for some years chairman of the water supply commission of Australia, has resigned his position to take up work with the University of California.



Every minute counts when you're busy hauling the crops. Save time by using

MICA AXLE GREASE

It takes less grease to do the work and half as many applications. The ground mica does it—makes the grease last twice as long—forms a lasting lubricating film on the spindles. Dealers everywhere.

PIPE

When writing advertisers, mention the Cultivator.

But another example of Samson efficiency are the one hundred and thirty-two Samson agents throughout the State. They safeguard the interests of Samson Sieve-Grip owners. At any hour of the day or night you may rely upon them for assistance in the field. Each one is bound by a specific agreement, by the terms of which they become service stations, fully equipped and prepared to give advice and help.

Greatly superior is this system to that of the traveling service representatives, his whereabouts always uncertain, here today and gone tomorrow. Delays in the field cost money. The Samson system wastes no time and gives that feeling of security so very pleasant in a busy season.

This same method of organization, of systematized procedure, is common to the entire business of the Samson Iron Works. No confusion, no slipshod carelessness characterizes our work. Everything is well-ordered and well administered. You benefit by it.

You should have the new book, "The Price of Harness and Two Good Mules." It is yours for the asking. It contains full information about the four to five horse-pull Sieve-Grip.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Reclaiming Alkali Land

Have a field containing 11 acres of level bottom land in the center of which there is an oval shaped tract of three acres of alkali soil which produces a heavy crop of salt grass but cannot grow any crop of value. In plowing the whole piece the salt grass roots are spreading to the good land and it seems a difficult matter to kill them by cultivation. Have been told that the salt grass may be killed by plowing under in July or August and leaving the roots undisturbed. Is this possible? The soil is always damp just beneath the surface. Could asparagus be profitably grown on such land?—Subscriber, Escondido.

The plowing will aid in killing out the salt grass. We think its destruction may be accomplished more quickly, however, if cultivation follows the plowing. Then if underdrainage can be given to dispense with the alkali it is probable that one of the richest spots on the place can be made of this worthless land. If black alkali prevails make a heavy application of gypsum.

Little Leaf or Root Knot

My five-year-old peach trees had a fine crop two years ago. Last year they died down and threw out a number of small limbs around the trunk. This year this growth died and more new growth is coming. What can I do for them or should I dig them up and replace? Also have apricots five years old which fail to bear.—Subscriber, National City.

Possibly these peach trees are affected with little leaf or more probably with root knot. In either case there is little which can be done for them and it is probable after two years' failure to maintain growth it would be best to replace with other trees. If root knot is the cause then care should be taken in excavating so as to remove all diseased or knotty growth. In addition it would be well to plant new trees in the center where there were no trees formerly. Perhaps the apricots had to endure unfavorable conditions at blossoming time so that no fruit could set. Possibly it is a matter of variety not suited to your conditions.

Poultry Manure On Grapes

Is hen manure good for bearing grapes?—Subscriber, National City.

We think poultry manure is good for any crop but we would advise using in very small quantities and working well into the soil.

Pear Blight

What is the trouble with Bartlett pear leaves which I send? The trees were grown in black adobe soil with plenty of irrigation. What does pear blight look like?—Subscriber, Orosi.

The greater part of these leaves were affected with pear blight which should be handled as described in our columns by pruning off all affected parts as soon as they appear. The other leaves sent have been submitted to a university specialtist who will tell us as to whether there is any other trouble with the trees. Pear blight, which is often called fire blight, causes the leaves to look as if they had been burned and they turn dead and brown. At the first attack the leaves are blackened and later turn brown.

Preserving Fruit for Exhibition

We are frequently requested to give formula for preserving fruit in glass jars where it is desired to keep in good condition to show type of fruit or for exhibition purposes. This matter of preserving fruits is a trade in itself and one in which the novice will probably make many failures before he learns the game. Much depends on variety, condition of fruit and other factors, and the solutions are modified in many ways to meet conditions. However, we may give the following general directions and from these may be worked out more specific lines of work:

Select the finest specimens of the fruit both as to form and size. Handle them carefully to avoid all bruising, and place them in bottles, arranging the specimens so as to show them to the best advanatage. Fill each bottle to the neck with fruit, then pour on the fluid recommended, filling the bottles to within half an inch of the stopper so as to entirely cover the fruit. Then place the stopper in the bottle and run a little beeswax or paraffin over the joint to make it air-tight. Tie the stopper down with a piece of strong cotton and attach to each bottle a label containing the following particulars: Name of the variety of fruit, name and address of the grower. Write also in each case in one corner of the label the letter suggested to indicate the fluid which has been used. Wrap the bottles in paper to exclude the light and preserve in a cellar or other cool place until required for shipment. Strawberries and raspberries should be cut from the plants or bushes with a pair of scissors, leaving a short piece of stem attached to each. Fluid—Formalin formaldehyde), one pound (16 ounces); water, 44 pounds; alcohol, five pints. Allow the mixture to stand, and should there be any sediment, pour off the clear liquid and filter the remainder through filter paper. This two per cent solution of formalin has been found very useful for preserving strawberries so as to give them a natural appearance.

Diabrotica

I send bugs which are destroying squash and melon vines. Have used arsenate of lead but it seems to do no good.—Subscriber, Gardena.

These little green bugs with black spots are diabrotica and they are a most perplexing pest. The three pounds of arsenate to 50 gallons of water which you used should have been sufficient. Would advise very thorough application, using care to reach lower sides of leaves. We do not know of any better treatment.

Spraying Lemons

When and how should one spray three-year-old lemon trees for black scale?—Subscriber, Upland.

As there would be danger of injury to young fruit by spraying at this time of year it is best to defer this work until August or September, or even any time before the last of December. Spray with kerosene emulsion, made as follows:

Kerosene, 20 gallons; Whale oil soap, five pounds; Water, ten gallons. Dissolve the soap in hot water. Add the kerosene while the suds are still hot (be careful not to get the kerosene too close to the fire) and stir thoroughly. After thorough emulsification dilute with cold water 1 to 8.

Balanced Ration for Man

I notice in looking over the inquiry column of a recent Cultivator the item from a reader who wants to know the proper rations for a normal man. Why not refer him to page 133, "Field Service Regulations," Service of Supply, United States Army, where they provide six different kinds of rations to meet the different existing conditions, which may be compared very nicely with the ordinary work and conditions met with on a ranch. Here he will find six different kinds of rations provided for all kinds of labor and emergencies as follows: Garrison rations, field ra-

Panama-Pacific Exposition Night Illumination. View from Main Entrance. The Jewel City is Wonderfully Beautiful at Night.

MANY CONVENTIONS

THERE are to be 833 conventions and congresses held in connection with the Panama Pacific International Exposition. Of these 34 are agricultural or horticultural. Education seems to call for the greater number, with 129. Business comes next with 75, and religious organizations call for a good one-third, or 71. Conventions of other organizations run down to as low as seven, the latter in the interests of historical and literary societies Music comes in for a great showing, and during the next few weeks there will be wonderfully attractive programs by some of the best musicians in the world.

Today is Alameda County day. Other days to follow within the next two weeks are as follows: June 4, American Sweet Pea Society Day, Berkeley Day, International Conference of Women Workers to Promote Peace Day, Traveling Ticket Agents' Day; June 5, Denmark Day, Oakland Day Childrens' Day; June 5-9, World's Light Harness Race June 6-12, Denmark Week; June 7, Norway Day, Benicia Day; June 8, Special Elks Day; Vallejo Day, American Library Association Day; June 9, San Jose Day; June 10, Reading (Pennsylvania) Day, Santa Clara Day; June 11, W. C. T. U. Day, Kamehameha (Hawaiian) Day, Newark (New Jersey) Day, Santa Cruz Day; June 12, Stockton Day; June 14, Flag Day, Salinas Day, South Carolina Day; June 15, All Oregon Day, Magna Charta; June 16, Portland (Oregon) Rose Day, Fresno Day; June 17, Boston Day, Bunker Hill Day, National Conference on Weights and Measures, Massachusetts Day, Friends of the Pacific Day; June 18, San Luis Obispo Day, United Swedish Singers Pacific Coast, American Medical Association Excursion; June 19, Bakersfield Day.

TO OUR READERS

You who take an interest in the big things of life, the things that are worth while, will attend the great Panama Pacific International Exposition. Many will go several times to view the splendid architectural wonders which have been wrought by the master architects of the world. In no similar space has so much beauty and utility ever been brought together. It is the culminating achievement of many men who have given their lives to the creation of beautiful buildings, life-like statuary and mechanical progress.

PRESIDENT WHEELER ON THE EXPOSITION

Here is what President Benjamin Ide Wheeler of the University of California thinks of the Panama-Pacific International Exposition, as set forth in a signed letter published in the last issue of "Current Opinion."

"An American who does not attend the exposition will have to explain why all the rest of his life.

"The architecture of the buildings and courts, the scheme of colors which draws all into unity, and the general plan constitute each and all of them landmarks in the history of art. The exposition and its features will be quoted for years to come, and the man who has not been here will have to go and sit down in a corner while the other people talk.

"The position of the exposition at the Golden Gate touches the imagination of all who see it and can never be forgotten. The exhibits mark the progress of invention and art up to this precise day of the world, and to see them is an education.

"Most important, however, of all is it for an American citizen that he should see the western coast of his country, and particularly the California that is set here to represent it. We of the West are inclined to think that anyone who has not seen that part of our land which looks out upon the Pacific is not living up to his full occasion for rejoicing and pride that he is an American citizen."

There are now on exhibition Percheron, Shire, Arabian, Thoroughbred and standard bred horses. The standard breds will remain in the barns of this department only until after the June races, which cover the period between June 5 and 15, when they will go to other race meetings and return for the fall races which will be held on the exposition track from October 30 to November 13.

The "Baby" Creeping Grip

$1100 and Up

F. O. B. California Common Points.

Cultivate with a

"Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator. The upkeep on the two tracks on each Baby Creeper will be insured for $25.00 per annum.

Catalogues of this and larger size tractors for the asking.

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

JUST at this time the most important work to be performed is keeping the soil thoroughly cultivated and irrigated. With the approaching warm weather this must not be neglected if best results are desired. If water for irrigation is lacking it would be a good idea to thoroughly mulch all plants, trees and shrubs with a good covering of straw or light manure. Weeds or other protection to shade the ground will assist materially in holding the moisture near the surface. The majority of planting should be done by this time. However, one may still plant beans, corn, potatoes, melons and cucumbers, table and stock beets, carrots, lettuce, pumpkins and squash.

Early cabbage and extra early cauliflower are being planted for late summer or early fall marketing. The best variety of cabbage for planting now is All Seasons or Succession. This is a large cabbage which is a bit late in maturing. It has large foliage, which protects the head from the extreme heat of summer. In cauliflower the only variety recommended for planting at this time would be Extra Early, Snowball or Dwarf Purple.

Peppers for field crop can be planted directly where they are to grow if the soil is in perfect condition. Plant the seed in hills about 12 to 14 inches apart. It is best to lower the hill an inch or two below the surface and plant about one inch deep. It is absolutely essential that the soil be thoroughly irrigated before planting.

Tomatoes may be treated in the same manner for a late crop.

This is the best season of the year to plant casabas. There is such a large variety of these that one may choose liberally from the different classes. The improved hybrid is a large, early maturing variety of fine quality. The Golden Beauty and Winter Pineapple are late varieties which may be kept in storage up until February. These do not mature as early as the hybrids.

If one has good sub-irrigated soil onions may be planted. These require naturally moist soil or an abundance of irrigation water. They should be watered every week or ten days and given continuous cultivation until the bulbs are formed.

Celery plants should be transplanted to the field or seed for winter crop may still be planted. The most popular variety on the coast is the Golden Self-Blanching. By some, however, the White Globe is preferred.

ADVANTAGES OF SPRAYING POTATOES

Potato growers have long realized that in seasons when blight is present spraying will check the blight and considerably increase the yield, but some growers have doubted that spraying is profitable on the average. It is impossible to foretell the appearance of blight, but since the disease generally does not appear every year, the tendency has been not to spray regularly in the belief that the aggregate gains will not repay the expense of spraying for a series of years. The 20 years' potato-spraying experiments at the Vermont station and 10 years of similar work at the New York state station recently completed answer the question as to the profitableness of spraying potatoes regularly in the affirmative and show such a margin of profit therefrom that the subject should command the earnest consideration of all potato growers.

The work at the Vermont station was begun in 1891. In the early experiments comparative tests of different fungicides were made, but the superiority of Bordeaux mixture soon became apparent, and in the subsequent years Bordeaux alone was used. The results showed conclusively that Bordeaux mixture very efficiently protected plants from the attacks of the early and of the late blight and seemed to serve in some way as a stimulus to the plant, so that it remained green from one to two weeks longer than the unsprayed plants and also yielded more and larger tubers.

The physiological effect on the plant is shown by the fact that even early in the season the sprayed plants stored more starch in their tubers than those not so treated. While the plants themselves from the sprayed and the control plats were of approximately the same size, "the weight of the tubers at this time was 24.8 bushels per acre in favor of the potatoes to which the Bordeaux had been applied. This would seem to indicate that during the months of July and August, while the tubers were growing, the unsprayed plants were not able to fix as much carbon dioxid and transform it into starch as were those that had not been so treated."

The results of the entire 20 years' work at the Vermont station show that Bordeaux mixture, even in years when no blight ocurs, increases the yield of the plants to which it is applied. This increased yield is always sufficient to pay for the cost of spraying operations. Spraying is to be regarded as an insurance that pays for itself. If the blights are prevalent the potatoes if thoroughly sprayed are insured against loss therefrom; if the season is a dry one and no disease occurs still the crop will be enough larger to pay for all the cost of spraying. The careful potato sprayer wins either way, no matter what the weather or disease conditions.

The results with iron sulphate-copper sulphate mixture indicate that Bordeaux mixture "in which part of the copper is replaced by iron has as great a stimulating effect as does the ordinary Bordeaux. Whether it is as good a fungicide has not yet been proved."

The increased yields from plats where the Bordeaux mixture was applied only to part of each plant indicates that even here there was a sufficient effect produced to manifest itself in a yield of 28 bushels per acre more than that obtained on the plats left entirely untreated. This is about what would be expected if half the leaves were touched by the Bordeaux.

In applying the mixture it is important to cover the plants uniformly and very thoroughly. The following directions for spraying are given by the New York state station:

In general commence spraying when the plants are six to eight inches high and repeat the treatment at intervals of 10 to 14 days, in order to keep the plants well covered with Bordeaux throughout the season. During epidemics of blight it may be advisable to spray as often as once a week. Usually six applications will be required. The Bordeaux should contain four pounds of copper sulphate to each 50 gallons in the first two sprayings and six pounds to 50 gallons in subsequent sprayings. Whenever (potato) bugs or flea-beetles are plentiful add one or two pounds of Paris green, two quarts of arsenite of soda stock solution or three to five pounds of arsenate of lead to the quantity of Bordeaux required to spray an acre.

Thoroughness of application is to be desired at all times, but is especially important when flea-beetles are numerous or the weather favorable to blight. The more frequently and thoroughly the plants are sprayed the better. There is no danger of injuring the foliage by too much spraying. Using the same quantity of Bordeaux frequent light applications are likely to be more effective than heavier applications at long intervals; that is, when a horsepower sprayer carrying but one nozzle per row is used it is better to go over the plants

(Continued on Page 647)

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

PLANTING operations at this time are confined mainly to asters, stocks and chrysanthemums. If chrysanthemums already planted are showing too tall a growth they should be cut back to within four to six inches from the ground and allowed to make new growth, leaving about three canes from each root. Remove all other growth and thoroughly mulch with good stable manure or commercial fertilizer. The chrysanthemum requires plenty of water and should be kept in good growing condition from now on. If the supply of asters is short seed may be planted in permanent bed or border. Plant in drills, in rows about two feet apart, covering the seed about one-half inch with good soil. Snapdragons, winter stocks, centaurias and delphiniums should be planted as early as possible if flowers are wanted for the holidays. Foxgloves, Canterbury bells, sweet william and hollyhocks planted now will give strong plants for fall bedding. These will not bloom this season, but will furnish early spring bloom. Florists about Los Angeles plant in succession nearly every month in the year the annual gypsophila. These require about four months to come into bloom. Planted in this manner one may have flowers the better part of the year.

If possible to obtain gladiolus bulbs they may be planted for midsummer blooming. Large bulbs will bloom more quickly than the smaller ones. For a succession plant the baby bulbs and the small, medium and large-sized bulbs, thus insuring a blooming period covering the better part of the summer. The little bulblets or corms separated from the larger ones in the early spring will bloom in about six months.

PLANTING GLADIOLI

A succession of plantings can be made from now on until the end of June. Plant them in rows from two to three feet apart, leaving about three to four inches between the bulbs in the rows. They should be set at least four inches deep. By planting the bulbs at intervals of about two weeks we secure a long season. See that the soil is worked deep and that there is plenty of well-decayed manure mixed into it. When they show above the ground keep the cultivator going every week until they have reached a height of about eight inches. During limited rainfall they should be watered at intervals quite profusely. It would be well to sort the corms over and plant all the small ones at first planting, leaving the largest for the last. Just before the last cultivation give some quick-acting fertilizer between the rows. It can be put on at the rate of three or four hundred pounds per acre. —Horticulture.

BILTMORE ROSES

One of the handsomest catalogs we have ever seen is that of the Biltmore Nursery of North Carolina. It devotes more than 100 pages to description and beautiful illustrations both in halftones and colors of the latest and finest in roses.

Don't expect to have fine blooms if you fail to feed the plants good manure every year.

The old fashioned garden pink is again coming into favor.

THE WHITE GRUB IN LAWNS

IT takes two years or more for these white grubs to reach maturity from the egg. In the first season they are so very small that the effect of their work is not noticeable, but the second year after the egg is laid we are apt to receive dozens of complaints.

There are several ways of combating this injurious insect which not only attacks lawns, but also the roots of strawberries and other plants. Copious watering of the lawn where possible will sometimes keep the grass ahead of the ravages of this grub. The robins, too, seek out and devour these, to them, delicious morsels. An entomological friend—a practical man—claims that he has got rid of them by putting tobacco stems thickly on affected parts of the lawn, allowing rain to leach them, as it were, and take the tobacco solution into the soil. Of course, water from a sprinkler would take the place of rain in a rainless season. We have caught with lantern traps a large number of mature June beetles or "June bugs," and eggs have been laid after females were trapped; indicating that lantern traps are a very good thing, used early in the season, and may attract females before the period of egg-laying. At Lakewood cemetery, Minneapolis, following our suggestion, they have used lantern traps made by placing lighted lanterns over tubs, and in each tub a little water covered with kerosene—which latter is deadly to all insect life—and caught hundreds of these brown beetles. Of course the effect of this wholesale slaughter of the brown beetle would not be seen on the lawn the summer the lantern traps were used, for the grubs doing injury at that time come from eggs laid a year or so before. It is possible that some apparatus may be devised for piercing the grubs as they lie an inch or so below the surface of the ground—some kind of "pounder," filled with spikes closely set together, might be used with success, where the sod has begun to show brown.—F. L. Washburn, Minnesota University Farm.

BULBS MAKE INDOORS MORE BEAUTIFUL

There are no other plants that can take the place of bulbs indoors in the winter. They need but slight attention to give a profusion of bloom through the cold winter months. They blossom freely where there is but slight sunlight and return to their owner many times their original cost.

"It is well to get your bulbs early and pot them in rich loose soil," says R. H. Denniston, assistant professor of botany, University of Wisconsin. "The pots should then be put in a dark cool place to let the roots develop. Do not water them after planting unless the soil becomes very dry. The soil used for potting should be thoroughly moistened and the bulbs planted so that just the tips show above the ground. If the conditions are right, the roots will begin to develop at once and when a good growth has been produced, green tips appear at the tip of the bulb. Then put the pots where the light is not too strong and let them remain till the buds show plainly. Remember that bright light is good for the bulb only after the buds appear."

The Chinese sacred lily and paper white narcissus may be grown in water and always give satisfaction.

Roman hyacinths and the various kinds of narcissus are easily grown if the above simple rules are followed.

Freesias, tulips and crocus will do well in pots if grown in a cool place.

The two lilies, candidum and harrisi, are grand bloomers, but are slow to develop.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

BEAN SITUATION

The board of directors of the Lima Bean Growers' Association will not meet until next Tuesday. It is rumored, however, that the 50,000 acres which it was stipulated should be signed up for the coming year's crop before June 1 have not been signed up. The final action which will be taken next Tuesday can only be guessed at, but it is assumed the original intention will be carried out and the association discontinued. We fear this will be a serious misfortune for the bean industry. However, it is the growers' own decision, and presumably members feel this step is safest.

FREE FAIR

Kansas inaugurates a departure in state fairs. In common with all other state fairs that of Kansas has charged a regular admission to all comers. Some other fairs have gone somewhat farther in absolutely refusing passes for any reason whatsoever; everyone who entered paid his 50 cents. Now Kansas proposes that its fair gates shall be wide open, and all the world is invited to come and view, without price, what agriculture can accomplish in Kansas. A special tax levy has been voted to pay for all premiums and to cover all expenses. Kansas anticipates that this may revolutionize fairs everywhere.

The Kansas fair grounds cover 78 acres near the state house at Topeka. The county has already invested about $320,000, and the city of Topeka and the county are aiding this movement for a free fair. This fair has been held at Topeka for 30 years, and this will be the first exposition without charge for admission.

LABOR WANTED.

The post office department is acting as intermediary between the wheat growers of the Middle West and the laborers. A call is being sent out for 18,000 men to aid in the harvest fields of Kansas. We doubt not Kansas will find it difficult to secure competent help to harvest her great crop. There are thousands without employment, but a very small proportion are fitted for the strenuous and intelligent work required in the harvest fields.

ATTRACTIVENESS PAYS.

We note in an eastern farm paper, "In these days of autos and rapid travel there is no beter advertisement for the farm than a good lawn and well-kept flower garden. This pays now that direct dealing with consumers is on." Attractiveness pays in so many ways that it hardly seems necessary to call atention to it, and it is not necessary to call attention to it so much in California as in Eastern farming sections, but of course there is always room for growth. If we would attract better people to make homes in our neighborhood we must first offer what they like. If we do not, the people who come in will be of a class which will join with us in maintaining the lower standard.

STANDING PAT

We note in the resolutions passed at the regular meeting of the board of directors of the Lindsay-Merryman Citrus Exchange that "It is resolved, That, having every confidence in the present management and general policy of the California Fruit Growers' Exchange, and feeling satisfied that they are fully awake to the necessities of our industry, we hereby desire to go on record as endorsing their general policy, believing they will protect our interests in every way."

From the whereas's which precede these resolutions it is shown that the members "have full realization of the fundamental and well-known causes which are responsible for the low prices—the excessive production of citrus fruits in other sections, the European war, the poor shipping quality of much of California's fruit, etc."

The citrus people are thinkers and of a class which will not be stampeded, and it will take even more than two or three seasons of disaster to make them desert the one organization which stands between the state's greatest industry and failure.

PURE MILK

Chief Lively and Superintendent Quisenberry of the department of live stock of the Panama-Pacific Exposition write that there is much interest manifested in the pure milk and cream show which will be held at the exposition June 14-19. The exhibits will be made in Congress Hall which is headquarters for the live stock department and for live stock people in general.

City and state boards of health and the dairy division of the United States department of agriculture are cooperating with Chief Lively in his efforts to bring together a creditable exhibit and to create an interest in more, better and purer milk and cream. Such exhibits as this will tend to impress upon the producers and dealers the great importance of cleanliness and better methods in producing and handing milk and cream.

It may appear to some dairymen that this is in the interests of the consumer, and perhaps that is true, but if it is, it certainly is in the interests of the producer, for unless producer and consumer keep fairly close together, the service or returns of the one or the other will be less satisfactory.

RURAL EDUCATION

Colman's Rural of May 29, 1875, makes this statement: "We have in the United States 38 agricultural colleges, with 389 professors and 3,917 students. Few of the graduates, however, become farmers."

This indicates a material difference in conditions 40 years ago and today. Outside of the increase in numbers—and there are single states which exceed in number all the agricultural students in the country 40 years ago—there is a vast change in sentiment as to the needs of the farmer. As stated in the above quotation, but few of the graduates of the agricultural institutions followed farming. While it is possible today that all who attend agricultural colleges do not become farmers, yet we believe the vast majority of those taking the agricultural work are doing it because they intend to make agriculture their lifework. Forty years ago agriculture was largely followed by main strength and awkwardness, and with the rich prairies just coming under cultivation, the crude methods yielded fortunes. Today the problems are greater and a better education is demanded to solve them. The boy of today who would become a farmer is compelled to fit himself to the limit if he intends to bring success out of farming.

AUTOS TO EUROPE.

It is possible that one good thing will come to Europe out of the war, and that is the introduction of vast numbers of autos and trucks. This suggestion is made, not in a spirit of sordidness, but from the standpoint of European interests. For example, writing regarding conditions in Russia, Mr. W. V. Logan of the Goodyear Tire Company, says:

"Take the automobile industry; when the war started there were only 12,500 motor vehicles in Russia, trucks, pleasure cars, large and small. The government purchased between $15,000,000 and $20,000,000 worth while I was there. After the war American automobile products will be very well known."

Of course this was written more from the commercial standpoint, but when we consider that in all Russia prior to the war there was not one auto for every ten now in California, it may be seen there was not very rapid transit in that country, especially when we take into account the fact that most of the railways are narrow gauge, single track affairs. Russia's greatest handicap during the war has been lack of transportation facilities. It is likewise a handicap in times of peace. Modern day methods call for quicker service. In other words, "Let gasoline do it."

In fact, Mr. Logan says that his trip from London to Petrograd required seven days, part of the trip being made in reindeer sleighs.

Agricultural Notes

A wireless telegraph station at Rio Grande, Tierra del Fuego, has been inaugurated and will shortly be opened for public service.

The tuna pack of California for 1914 was nearly double the 1913 pack. It amounted to 310,000 cases, valued at over a million and a half.

Eggs are forming a new and important factor in our exports to Argentina. One recent report showed 2,842,000 eggs, valued at $64,942, sent in a single shipment to Buenos Aires.

The smallest homestead in the United States is eight-hundredths of an acre. It is on Turtle Lake, Minnesota. It was commuted after 17 months' residence for 10 cents.

Sixteen thousand to 18,000 men will be needed in Oklahoma for the grain harvest, reports the commissioner of labor at Oklahoma City. Wages will be from $2 to $3 per day and board. Most of the farmers have expressed a preference for English-speaking white men.

Before the outbreak of the present European war practically all the fresh fruit and much of the dried fruit imported into Goteborg, Sweden, came through Liverpool or other intermediate ports. Now Goteborg fruit agents are ordering direct from the United States.

A report received in Paris from Basle says that all the employes on the Berlin Underground Railway are now women. Women are also employed on suburban lines, where they are to be seen cleaning the cars and even working with the picks and shovels.

The department of state of the United States has issued programs for the Second Pan-American Scientific Congress which will be held in Washington, D. C., December 27, 1915, to January 8, 1916. Appropriations aggregating $50,000 have been made by the United States for the congress.

The apple yield of the island of Tasmania this year was cut to one-half normal by drouths and frost. Nevertheless after supplying domestic needs and using large quantities of apples in cider and jam factories, Tasmania exported 2,000,000 cases of apples to the other states of Australia and to foreign countries.

Large quantities of coffee and cocoa from South America are now being re-exported from the United States to Europe. Over 40,000,000 pounds of coffee, chiefly from South America, has been exported during the period from August 1 to March 1, against about 7,000,000 pounds in the same months of last year, and approximately 20,000,000 pounds of cocoa, against 3,000,000 pounds in the corresponding months of last year, and nearly all of it has gone to Europe.

One vessel leaving New York for the eastern coast of South America a few days ago carried for Brazil $25,000 worth of printed and advertising matter, $3,000 worth of agricultural implements and $10,000 worth of miscellaneous machinery; for Montevideo, Uruguay, $6,000 worth of paper, $13,000 worth of malt and $40,000 worth of miscellaneous merchandise; for Buenos Aires, $20,000 worth of automobiles, $11,000 worth of fertilizer, $12,000 worth of agricultural machinery, $17,000 worth of electric material, $20,- worth of dry goods, $25,000 worth of shoes and $25,000 worth of miscellaneous machinery.

Agricultural News Notes of the Pacific Coast

Northern California

Orland's alfalfa meal mill was opened last week.

The first shipment of peaches was made from Placer County May 17.

Colusa County expects to have a county library established in the near future.

The early cherry crop was practically a total failure owing to rainstorms.

Some rust has been showing in the wheat and barley fields of Butte County.

Improvements costing nearly $38,000 will be made on the Tahoe national forest this season.

A steel lookout tower will be built by the forest service in the Truckee-Sierraville district.

Approximately two and a half tons of butter were shipped from Orland on Monday of last week.

The citriculture class from the University of California visited orange and lemon groves of Orland last week.

The Alameda Sugar Company has entered into contracts with farmers for nearly 5,000 acres of sugar beets.

The Placerville Fruit Growers' Association has awarded a contract for the erection of a new fruit packing house.

A dairymen's association was formed at the farmers' picnic, held at Greenwood Grove, Glenn County, on May 29.

Farmers' short courses at the university farm, Davis, Yolo County, will begin on Monday, October 4, continuing for six weeks.

It is reported that Cedarville, Modoc County, will soon have a modern creamery with capacity for handling butter fat from 2,000 cows.

Farmers of the section about Bogue, Sutter County, met at Bogue on June 1 to organize a local branch of the Farmers' Protective League.

There will be a big farm bureau picnic at Newark, Alameda County, June 19. Demonstrations of cattle and poultry judging will be given by experts.

The Congressional Rivers and Harbors Committee will visit California in July. The irrigation districts will then present their claims to appropriations.

El Dorado national forest service crews are now busily engaged repairing telephone lines and putting the system in perfect working order to all fire stations.

The Grass Valley High School Agricultural Club announces there will be 18 entrants among its membership in the potato growing contest conducted by the state farm school.

Prof. Davidson, recently elected professor of agricultural engineering at the university farm school at Davis, will superintend construction of a testing plant for agricultural machinery.

The Oroville Chamber of Commerce has received word from officials of the Missouri Pacific Railway that extensive publicity is being given by their passenger service to the gift of flowers made by the people of Oroville to exposition visitors passing through on the trains.

Central California

Ceres, Stanislaus County, is now assured of a $50,000 condensary.

Last month California shipped 500,000 pounds of butter to Australia.

Large plantings of beans are being made in the Porterville district this spring.

Livingston, Merced County, shipped out 30 crates of summer squash last week.

Kings County claims to be shipping 150 tons of alfalfa hay per week to New York.

Redbanks, Tulare County, made the first shipment of early peaches, consisting of 97 crates.

Weather conditions have delayed the tomato crop of central California for some two weeks.

Hundreds of acres of walnuts have been planted in the section about Visalia this last season.

The McFarland, Kern County, cooperative creamery is manufacturing 100 pounds of butter daily.

A meeting of citrus growers at Sultana, Tulare County, is called for June 5 to organize a citrus fruit exchange.

The Farmers' Union of Gilroy, Santa Clara County, has purchased a site for a cooperative packing house.

The cutting of grain has started in Kings County. It is estimated the yield will run an average of about 40 sacks to the acre.

The Tulare Cooperative Poultry Association transacted a business during May amounting to within a fraction of $6,000, exceeding last month's business by $700.

Fresno commercial organizations are discussing method of disposal of a bumper peach crop. The estimated crop of the valley this season is 40,000 tons.

The Visalia Creamery, the Lakeview Creamery Company of Corcoran and the Tulare Cooperative Creamery have joined in opening up Los Angeles headquarters for their products.

Many orchardists along the Pajaro river are reported to be planning to dig up their orchards, as they are losing in thrift, presumably from the high water of the last few years.

The Wells-Fargo Express Company has asked for a rehearing of the butter and cream rate case recently brought against it by the Dairymen's Cooperative Creamery Association of Tulare.

Stanislaus County has declared off its squirrel extermination campaign, as it is considered too expensive to continue it at the present time, although good work has been done in the past.

Members of the state water commission visited Owens Valley the last week in May. Many petitions have been received by the board to determine water rights of residents of Owens Valley.

Raisin growers of the San Joaquin Valley estimate that there will be a saving to them of $350,000 a year on raisins shipped from the Valley because of lower fruit rates recently applied for by the Southern Pacific Company.

Southern California

A broom factory has been established at Huntington Beach.

Banning peach growers are busily engaged in thinning a big setting of fruit.

An unusually heavy grain crop all over the southern part of the state is indicated.

The walnut aphis is said to be doing considerable damage in orchards of Santa Paula, Ventura County.

A report from walnut groves of Ventura County states that walnuts are setting in clusters like grapes.

Two crates of bell peppers, raised in Villa Park, Orange County, brought the record price of 40 cents a pound.

A laboratory has been established at Brawley to conduct experiments in utilizing cull watermelons and cantaloupes.

Ranchers of the San Fernando Valley are already putting in pipe lines which will connect them with the Los Angeles aqueduct.

The new $30,000 plant of the Pomona Valley Canning Company has just been completed. Its apricot run will begin about June 20.

All Southern Pacific and Santa Fe trains operating on the San Joaquin Valley lines are being detoured by the coast route owing to a tunnel fire in the Tehachapi.

Eighteen hundred more acres will be planted to beans this year along the coast between Oceanside and La Jolla than in 1914. Much of this land will be planted to blackeyes.

Fourteen extra rangers will be added to the force of the forest bureau of Southern California this summer. This will make a total of 50 men at work south of the Tehachapi.

The Victor Valley reclamation project, which contemplates the irrigation of 56,000 acres, has been placed in the hands of engineers of the United States reclamation service.

The annual meeting of the Ventura County Farm Bureau, held at Foster Park Saturday, May 29, was addressed by Dr. Thomas Forsyth Hunt, dean of the college of agriculture, University of California.

Taking walnut growing sections of the state as a whole, the crop this year is a good average one, according to reports received at a recent meeting in Los Angeles of the California Walnut Growers' Association.

David Coey of Yucaipa, San Bernardino County, has been made general chairman of the committees which will arrange for the annual apple show this fall. The date for the show has not yet been set, but it will probably be some time in October.

The San Gabriel Valley Potato Growers' Association has chosen J. D. Cleminson of El Monte president for the ensuing year. The organization has about 100 members in Puente, El Monte, Baldwin Park, Whittier Heights, Bassett and Arcadia sections.

The Ventura County Dried Fruit Association was reorganized at its annual meeting held Saturday, May 15, at Santa Paula. It will hereafter be known as the Ventura County Cured Fruit Association and will market through the California Cured Fruit Exchange.

The Coast

Boll weevil has been found feeding on wild cotton in Arizona.

Northern Idaho is reported by the state veterinarian free from hog cholera.

The sixth annual state horse show was held at Ritzville, Washington, May 14.

Chandler, Arizona, is forming a local of the Arizona Farm Improvement Association.

Chandler, Arizona, has promise of a new creamery and ice plant to be erected very soon.

A summer session of the Washington Agricultural College will be held at Puyallup, June 23 to July 31.

Dairymen of the coast district of Washington are organizing a company to establish a cheese factory at Palouse.

The recent Idaho legislature created a department of farm markets under the directorship of W. D. Scholtz at Boise.

The Texas Cattle Growers' Association is urging Governor Ferguson to remove the quarantine against Mexican cattle.

It has been estimated that the Pima and Papago Indians in Arizona will receive about $125,000 for their grain crop this season.

The Northern Pacific is handling from 10 to 15 carloads of horses weekly, shipping them East for use on the European battlefields.

The Farmers' Union and Granges of Washington and Adams Counties of Idaho held their third annual union picnic at Cambridge May 27.

A flock of 1,200 sheep at Boyds, Washington, were crazed by eating death camas and many of them jumped to their death in the Kettle river.

Farm Adviser Armstrong of Maricopa County addressed members of the Farmers' Union at Chandler, Arizona, Saturday evening, May 22.

A quarter of a million head of sheep have been gathered at Riverside, Oregon, for shearing. This shearing plant runs through about 5,000 head daily.

Tick fever or spotted fever is more prevalent in eastern Oregon this year than ever before, according to the statement of the state board of health.

The Tillamook Cow Testing Association of Tillamook, Oregon, now proposes to organize a branch association for cooperative calf marketing.

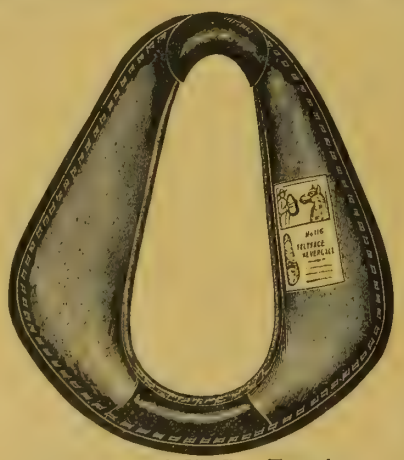
Oregon requires that all buyers of milk and cream for manufacture and all operators of Babcock testers on milk or cream offered for manufacture must secure a license.

The United States department of agriculture will assist in destruction of coyotes of eastern and southern Oregon, to put an end to the epidemic of rabies in those sections.

The Inland Empire Jersey Breeders' Association held its first annual sale on the fair grounds at Spokane Monday, May 10, when 46 pure bred Jerseys and 23 grade cattle were sold.

O. T. Clawson of Wenatchee, Washington, has been chosen to inspect fruit shipped from the Wenatchee Valley this fall, his services to be paid for jointly by the state and the Growers' League.

SORE SHOULDER INSURANCE



If you could get insurance against your horses becoming sore-shouldered when most needed, you would take it at any reasonable price.
Why not take it FREE by using
W. DAVIS & SONS'

Horse Collars

"Felt-Face" .....each $5.00
"Cushion" Collars.....each 3.00

This "Cushion" Collar is a combination of leather and canvas, guaranteed to cure sore shoulders and "stand the racket."

The "Felt-face" collar is all-leather, first-quality of oak-tannage, hand-thonged throughout. It has a facing of felt under the leather face, producing a soft yet firm surface against which the animal pulls.

It is natural for any manufacturer to say that his collars are "the best," but it is only about "FELT-FACE" collars that letters like this are written:

W. DAVIS & SONS, San Francisco.
Gentlemen:—I sold the Red Bands Orchard Co. two Felt-face collars about a month ago for two sore-neck mules which are all healed up now. They came in today and ordered one dozen. Please send me soon as possible 1½ dozen, from 17 to 22-inch. Very truly,
W. F. INGWERSON,
(Harness-maker) Visalia, Cal.

Live Stock and Dairy

REPELLENTS FOR PROTECTING ANIMALS

VARIOUS kinds of flies tend to injure cattle by weakening them and reducing their milk supply. It is fairly well established that the stable fly does considerable damage, especially in northern Texas, where it was found that it killed stock directly, made cattle more subject to the recurrence of Texas fever and reduced milk supply, causing a loss estimated at over $25,000 in a single year. The test experiments with dairy cows seem to indicate that the effect of flies on milk is not of great economic importance, although evidence seems to show that animals protected from flies feed better and are generally in better condition. Reduction in milk, some authorities believe, is due as much to the fact that cows do not graze as freely in the hot sun in summer as at other seasons.

In general the conclusions are that many of the substances, such as pyrethrum powder, camphor, citronella and sassafras, while temporary repellents, lose their effectiveness very shortly. Ten per cent solutions of the liquids in cottonseed oil, therefore, commonly have to be applied daily.

Various oils, emulsions of oils and mixtures of oils are used in repelling flies. Crude petroleum, cottonseed oil, fish or train oil, and light coal-tar oil may be used pure.

Jensen (1909) recommends the following formula, which is said to protect cows for a week: Common laundry soap, one pound; water, four gallons; crude petroleum, one gallon; powdered napthalin, four ounces.

Cut the soap into thin shavings and dissolve in water by the aid of heat; dissolve the naphthalin in the crude oil; mix the two solutions, put them into an old dasher churn and mix thoroughly for fifteen minutes. The mixture should be applied once or twice a week with a brush. It must be stirred well before being used.

Fish oil is rated as one of the best repellents and has been used alone and in combination with various other substances. Other substances that have repellent qualities and that have been used in various mixtures are pine tar, oil of tar, crude carbolic acid, oil of pennyroyal and kerosene. The protective action of fish oil is stated to range from less than two days to six days. Moore's formula is said to protect for two days. This mixture is safe when applied lightly with a brush, but not when applied liberally with a pail spray pump. The formula is as follows: Fish oil, 100 parts; oil of tar, 50 parts; crude carbolic acid, 1 part.

Laurel oil is a very effective repellent. Mayer found that the protection lasted from two to twelve days. The oil when used pure has an irritating effect unless it is applied lightly. According to Mayer, the irritating effect may be overcome by combining it with linseed oil in the proportion of one to ten. In the experiments of the department of agriculture it was found that 10 per cent of laurel oil in cottonseed oil was active for less than a day.

A number of formulas for repellents for application to wounds have been recommended by various authors.

In experimental tests carried out by the department the following results were obtained:

A 10 per cent mixture of crude carbolic acid (21.8 per cent phenols) in cottonseed oil has a very strong repellent action on flies, but this lasts less than a day, in consequence of which it is necessary to apply the mixture every day. The mixture should be applied lightly with a brush, since a heavy application with a spray pump is likely to cause phenol poisoning.

Mixtures consisting of 10, 20 and 50 per cent of pine tar in cottonseed oil have marked repellent qualities. They should be applied lightly and it is necessary to apply them every day. A liberal application of a 10 per cent mixture is deleterious to animals.

GLANDERS VACCINE NOT SATISFACTORY

That glanders vaccine is not effective in rendering horses immune from this dangerous disease is the conclusion reached by specialists of the Bureau of Animal Industry, United States Department of Agriculture, as a result of extensive experiments with horses and other animals. The experiments show that while mallein is highly effective as a means to discover the presence of glanders in a horse, neither mallein nor glanders vaccine has shown any positive value in curing animals sick with glanders.

In the experiments 17 horses were used. These were stabled under such conditions that vaccinated and unvaccinated horses could be brought into contact with a good discharging case of glanders. Mallein and eye tests were used carefully to determine the results. The investigators report the following conclusions, which appear in a professional paper published by the department, entitled "Immunization Tests with Glanders Vaccine":

"The results obtained by these investigations appear to be sufficient to demonstrate the unsatisfactory results of this method of immunization. Of the 13 immunized animals nine contracted the disease from natural exposure, which is a large proportion when it is considered that all animals were aged and kept most of the time during the exposure out of doors. Of the four remaining immunized horses one died of impaction after the second vaccination, while the other three animals were killed August 20, 1913, in order to ascertain by post-mortem examination the possibility of glanders existing in these animals which had given positive serum reaction, but which had returned to normal. In artificial infections of the vaccinated animals they showed no resistance whatsoever, as both vaccinated horses promptly developed an acute form of the disease from touching the Schneiderian membrane with a platinum loop which had been touched to a growth of glanders bacilli. For the present, therefore, it seems advisable to abstain from immunizing horses by this method, as a practice of this kind may do more harm than good. Owners having horses which are supposedly immunized would naturally become careless, thinking their animals were resistant to the disease, and thus even a better opportunity would be offered for the propagation of the disease than if the horses were not vaccinated. Furthermore, the fact that the blood of vaccinated animals cannot be utilized for serum tests for two or three months after the injections is also a great disadvantage in the eradication of the disease.

"As a result of this preliminary work it appears that the control and eradication of glanders must still be

dependent upon the concentration of our efforts in eliminating infected horses and the adoption of proper precautions against the introduction of infected animals into stables free from the disease. The results achieved in Germany, Austria and Canada by these methods have proved very encouraging, and no doubt if executed in the same spirit in this country a marked reduction in the cases of glanders would result."

FURNISH PLENTY OF GOOD WATER

I have had a good many years of experience in raising hogs with pleasing results and have always been very careful in seeing that their water supply was the purest to be had on the farm. I believe it is just as important to furnish hogs good, clean water as it is any other animal. I know by closely observing them that they prefer it to any other kind. Some men are particular about the drinking water for their cows or other stock and for themselves, but consider anything to be good enough for their hogs. This is a mistake. If furnished with plenty of good water the hog will more than repay the trouble with a goodly gain in pounds and many grateful grunts of satisfaction.

The question of the amount of water is usually left to the hog to decide for himself, and this is a pretty good way to settle the matter, unless the owner knows of a better one. One of our greatest authorities on swine, Prof. William Dietrich, says that a hog will drink too much water during hot weather and not enough during cold, and that better results can be obtained by forcing him to take a definite amount according to his size by mixing the water with his feed, so that he will be sure to get enough and not too much. This is reasonable, for the hog consumes a great amount of carbonaceous food, especially when fattening is going on. Such food, with the large amount of fat carried in his body, would cause a feverish condition during hot weather, and the animal will drink much water in an effort to lower the temperature of his body.

As to the proper time to supply the water, that can be left for the hog to decide, if a supply is always accessible. But if the water is pumped to them or carried and poured into troughs, I consider it a good plan to water just before each meal. The stomach of the hog is comparatively small and if he does his drinking after eating a full meal there is danger of part of the feed being washed from the stomach before the digestive juices have had sufficient time to act upon it as they should. During warm weather they want another drink just before time for the next meal, so it is best to refill the troughs after all have taken a drink.

This subject of watering hogs may seem a small matter, and it may not be of as much importance as some others connected with the growing of swine, such as breeding and feeding, but the majority of us spend nearly all our time looking after those bigger things and do not give enough thought to some of the lesser details, while our time should be divided according to the importance of our different operations among all the subjects pertaining to our work. The watering isn't such a small matter, either, for practically one-half the weight of the hog when he walks over the scales is made up of water, while many times this amount has to be used during his life to carry the food to the parts of the body where it is needed and in removing the waste matter from the tissues. —Farmers' Guide.

POINTS IN FAVOR OF SILAGE

More feed can be stored in a given space in the form of silage than in the form of fodder or hay.

There is a smaller loss of food material when a crop is made into silage than when cured as fodder or hay.

Corn silage is a more efficient feed than corn fodder.

An acre of corn can be placed in the silo at less cost than the same area can be husked and shredded.

Crops can be put in the silo during the weather that could not be utilized in making hay or curing fodder.

The silo must be plastered inside with a one to three mortar, wetted with strong alum water. Sift the sand. A two-inch square strip should be

SEEING the Difference BETWEEN THE DE LAVAL AND OTHER Cream Separators

IT DOESN'T TAKE AN EXPERT knowledge of mechanics or a long working test to tell the difference between the De Lavel and other cream separators.

ON THE CONTRARY, WITH A 1915 De Laval machine placed beside any other separator the difference is apparent at first sight to the man who never saw a separator before.

IF HE WILL THEN TAKE FIVE minutes to compare the separating bowl construction; the size, material and finish of the working parts, particularly those subject to wear and requiring to be occasionally taken apart and put together; the manner of oiling, and everything which enters into the design and construction of a separator as a simple, durable machine, he will still further see the difference.

IF HE WILL GO A STEP FARther and turn the cranks of the two machines side by side for half an hour, particularly running milk or water through the bowl, he will see still more difference.

AND IF HE WILL TAKE THE two machines home, as every De Laval agent will be glad to have him do, and run them side by side in practical use, the De Laval one day and the other machine the next, for a couple of weeks, he will see still greater difference in everything that enters into cream separator practicability and usefulness.

THE MAN WHO TAKES EVEN the first step indicated in seeing for himself the difference between the De Laval and other cream separators doesn't put his money into any other machine one time in a thousand.

THE COMPARATIVELY FEW buyers of other separators are those who merely read printed matter claims or listen to the argument of some dealer working for a commission, and who do not think it worth while to see the difference for themselves.

THE WISE BUYER OF A CREAM separator today does see this difference when buying his first separator, while the unwise or careless one usually finds it worth while to do so when he comes to buy a second cream separator a year or two later.

EVERY DE LAVAL AGENT CONsiders it a privilege to show the difference between the De Laval and other separators, and to afford every prospective buyer the opportunity to try out and prove the difference to his own satisfaction, if on first examination he feels the slightest doubt about it.

THAT'S THE REASON WHY four buyers out of five are buying De Laval Cream Separators in 1915, and why the use of De Laval machines will, before long, be nearly as universal on the farm as already is the creamery and milk plant use of power or factory separators.

Thornburgh SIDE DELIVERY BUNCHER AND WINDROWER

Make more money on your clover, alfalfa, timothy, peas, flax, vetch, soy beans—all short grain crops, by using the Thornburgh Side-Delivery Buncher and Windrower. Save waste of time, seed, fodder. Chalmers, Oregon, writes, "Best assistance I've had in 16 years. Cuts a third more acres in half the time, cuts clean, puts hay in shape for quicker loading, turns it out of horses way, no waste of seed."

Easily Attached to any Mower Leaves crop in either loose bunches or windrows. Heads and leaves in center, stems out to dry quick. Saves seed and leaves. No raking or tedding. Buncher can be folded for moving, not necessary to detach. Thornburgh Bunchers used in every state. Positively warranted to work right. Costs little—pays for itself every day. Write for catalog. Mention dealer's name. Write nearest distributor or to us.

DAIRYING IN AN ORCHARD

(Continued from Page 627)

ing time. The pigs are counted as a dairy asset and do not figure on the books as a separate item. Undoubtedly they are very profitable.

Labor

Two men care for the 40 cows, doing all feeding, milking, cleaning the barn, separating cream and delivering milk and cream at the electric car. They have nothing to do with gathering feed or disposing of manure after it is once out of the barn. Such work belongs to teamsters. If the milker has a family he receives $60 a month and a cottage to live in. If single, $40 and board.

Results

The dairy product is sold chiefly as whole milk to foothill towns. A little cream is always separated, and when there is a surplus of milk there is more sweet cream to sell. The price obtained for milk is 20 cents a gallon and for sweet cream, $1.25 a gallon for about 30 per cent fat, all f. o. b. electric cars at the farm and cans washed and returned free.

During 1914, the sales of milk, cream cows, calves and pigs exceeded the dairy expenditures by $1400. The investment in buildings, equipment and stock is inventoried at $7000. Interest on this at six per cent still leaves a profit margin of approximately $1000 for the year. Into this calculation the value of the manure does not enter. Neither does the dairy carry the cost of distributing the manure, as that is charged to the orchard. The value of the manure made by a cow is variously estimated at $12 to $18 per year. If this were considered, there would be at least $600 more to be added to the profit side. However, since the dairy is not charged with the value, or cost, of orchard pasture, nor with the green alfalfa, there had best be no manure credit. Probably the benefit to the orchard from nitrogen fixation by the legumes, humus added by winter crops not consumed by the cows, and soil penetration by alfalfa roots, balance the cost of growing these crops.

For the crop season of 1912 a test was made of the effect of applying liquid manure. Four hundred gallons of liquid were placed about five prune trees, or eighty gallons per tree,—this in the early winter. The following fall these trees bore fruit at the rate of twelve green tons per acre, while the average for a similar orchard was four tons. Returns from the application of solid manure are not so quickly apparent, but if slow they seem to be sure.

If a good market could be obtained for the milk product, it would seem that many an orchard would profit by a dairy equally well and carefully managed as the Sorosis.

The feeding of the boar is often neglected, since he is used for only a brief period each year. He should be always kept in good condition and his feeding should not be neglected even though he is not being used. For best results he should not be too fat or too thin but kept always in good breeding condition and should be kept in such condition the year around.

One mistake which is often made is selecting the best looking pig in the litter at the time of weaning the pigs, as at that time he is perhaps short of leg, compact and very blocky in appearance. Experience has shown that oftentimes the leggy, more rangy pigs in a litter will later grow out into the type of a much better sire.

With proper care and handling of the boar he should, if fully mature, be able to handle about 50 sows. After one has obtained a satisfactory sire he should be kept in the herd and used just as long as he produces satisfactory animals, since a tried sire is worth a great deal more than an untried one.

When a farmer is breeding up his herd by raising heifers to take the place of his poorest cows it is especially important to keep records of production, for in no other way can he know whether he is advancing or standing still. Guesswork as to which are the best cows is an unreliable way as has been proved in many cases.

Loss is due often to a failure to recognize the fact that the fattening period with most hogs is but a continuation of the growing period and that the greatest difference in the rations used during the two periods should be in the amount rather than in the kind of feed.

A clean yard is a great help in keeping the cows from becoming soiled by mud and manure. The yard should drain away from the buildings and manure should not be allowed to accumulate in it.

A THOROUGHBRED OR A SCRUB?

WHY EXPERIMENT

with a "Near Silo" when you can buy the IDEAL GREEN FEED SILO, a thoroughly practical piece of equipment built by a concern that knows how.

A silo to be of any value to you must be absolutely air and water tight in all joints, and of such design, material and workmanship that the shrinkage, while empty, can be taken up and the silo made just as effective after a period of years of use as when first constructed.

UNLESS YOU BUY A GOOD SILO you had just as well do without one for it will be a source of loss to you instead of profit.

THE IDEAL GREEN FEED SILO is the result of over twenty years' practical experience in silo building, and will return to you as good ensilage every pound of good feed you put into it.

ECONOMICAL FEEDING.

Written for the California Cultivator
By Jean A. Koethen

ECONOMY in feeding has two sides, the side of actual saving and the side of efficiency. The man who reduced his horse to a straw a day accomplished a feat in saving, but the plan was far from efficient. If we can think of saving in money as one straight line and of efficiency of feed used as another straight line, then we may expect to find real economy at the point where these lines intersect.

In the feeding of chickens we have a definite aim, according to the age, sex and character of the stock. The laying hen must have materials for the manufacture of eggs, protein for the white, fat for the yolk, lime for the shell. The growing chick needs material for building tissue and muscles; this again is protein. The pullet that is being developed into a fall layer will not develop into the right sort of layer unless she has the right feed and plenty of it, and here again protein is needed. In the case of the chick and the maturing pullet time is the very essence of economy, for the sooner the chick can be passed on from the rich feed of baby chickhood to the cheaper grains that are used for general feeding the less will be the cost of raising. In the case of chicks intended for market this is doubly true; every week taken from the time before the broilers are placed in the fattening coops is so much clear gain.

But another factor comes in here which must be considered more or less in all feeding. I mean the bird itself. Some breeds reach market size considerably earlier than others; some strains reach market size more quickly than others of the same breed; and, to bring the matter to a still finer point, there are great differences among individuals of the same strain and even of the same parentage. Ability of the bird to digest and assimilate food seems to be quite as important a factor in economical feeding as the character of the food given. Some hens will lay on almost any feed; others will not lay however they are fed. Some chicks will grow and thrive on the poorest ration; others never thrive at all. The bird that can digest and assimilate the greatest amount of food is almost always the bird with a good appetite, and a good appetite is the first and most important mark of vigor.

This brings us down to constitutional vigor as a basis for economical feeding as well as for almost everything else. No matter where you start all roads lead to a strong constitution in the bird itself as the basis of all profit in poultry culture.

The first step to economy in feeding must be then to eliminate from the flock all birds that are not worth the feed you give them; the hen that consumes feed to the tune of a dollar and a half in the course of a year and does not lay 100 eggs; the chick which falls behind the rest of the brood the first month; the pullet that is undersized and likes to linger on the roost; cull them out, every one. Here is where economy begins. I do not know how true is the statement I have seen made more than once that half the hens the country over do not pay for their keep, but I suspect it is at least half true of the hens kept on farms and in backyards. Get rid of the boarders, sell off all but one breed, build that up by the addition of better blood, and then you will have a basis for the study of economy in feeding.

Next to good stock in building up a scheme for economical feeding comes exercise. Unless you are feeding market stock with the intention of increasing weight as much as possible in a given time, there is absolutely nothing to be gained by giving stock feed which shall merely go into layers of fat, and this is just what happens when stock is fed all it will eat and not compelled to exercise. This is not saying, of course, that exercise takes the place of protein, but even protein does not accomplish its full purpose unless the muscles are developed by exercise. With birds of all ages there is always danger when exercise is not provided for, of a flabby, over-fat condition which often induces disease. Hens stop laying, young stock get leg weakness and turkeys, blackhead, unless there is a chance for using the muscles which protein builds up. Feed given under such conditions is obviously wasted.

Wheat has been known as "the perfect food," containing as it does, just the right amount of protein (about one part to six of fats and carbohydrates), but wheat just now is out of sight, and the question is what can take its place. With wheat go bran and middlings which are by-products of the milling of flour. Eastern poultrymen turn to corn in place of wheat, but we of the Pacific Coast look to barley, partly because it is cheaper than other grains, partly because in the warmer portions of California corn is found to be too heating. The nutritive ration of whole barley is a little wider than that of wheat, being 1:7.7, and its per cent of digestible protein is also a little less, being 8.75 where that of wheat is over 9 per cent, but it is easily balanced with beef scrap or milk and is a very good feed after the birds have been taught to like it. Probably it is more palatable sprouted than in any other form, but it loses a large part of its protein content when it has been sprouted five days and is of most value as green feed. Rolled barley has a nutritive ratio of 1:9.6 as against the 1:7.7 of whole barley and is by that much a poorer feed, but it may sometimes be had so cheaply as to make it worth while. Some poultrymen have good success with rolled barley. I have never been able to teach my hens to eat it dry, and they soon tire of it when it is steamed. This is on account of the hull I presume. Doubtless they could be starved to it.

Ground barley, which has a nutritive ratio of 1:8.1, is by no means as good a feed as wheat bran, yet it may be substituted for part of the bran in the mash, and this is quite generally done. At the Panama-Pacific egg-laying contest the following mash formula is being used: Five pounds bran, 5 pounds shorts, 5 pounds ground barley, 3 pounds meat scraps, 2 pounds soy bean meal, ½ pound fine charcoal, 1-10 pound salt. The management of the contest declares that, while it is possible to give these hens other good rations, "it is not thought possible to give them a ration which will be productive of best results and which will exceed in economic value the one here named." With this mash ration is given a scratch feed consisting of 15 pounds wheat, 7½ pounds barley and 7½ pounds cracked corn. A daily ration of sprouted oats is also given. Barley, it will be seen by examining these two rations, is one-third the ground grain and one-fourth the scratch grain. A greater proportion than this is not considered economical.

The term protein is applied, not to a single material that can be isolated and identified, but to the nitrogenous materials of the body. Some of these are more digestible than others. Some of them are more often used as if they were carbohydrates, the sugars and starches which are converted into heat and energy. But all are classed as either protein or crude protein and all are useful for growth and egg production. They are found to a greater or less extent in all kinds of feed, and their availability depends partly upon their digestibility and partly upon the digestion of the bird to which they are fed. Sometimes perhaps their digestibility depends upon the foods they are used with. Thus it is said that corn when used with a large amount of animal food loses its objectionable features. I have read that some poultrymen in this state have been successful in using corn in this way, but how permanent the success was I cannot say.

Alfalfa contains a relatively large proportion of protein in spite of the fact that it is 80 per cent water and could probably be used advantageously in much larger quantities than is common. Some experts see in its use the easiest method of cutting down the feed bills. Fowls are very fond of it, and hens and chicks that have alfalfa range certainly eat less grain than those without it. Cut alfalfa in the mash is very wholesome, and even dry alfalfa hay when used for scratching litter furnishes considerable nourishment. Alfalfa meal in the dry mash takes the place to a certain extent of bran and is quite generally used.

Some careful feeders advocate the use of the moist mash in place of the dry. It is claimed that the mash goes farther in this way. Undoubtedly young stock does grow more rapidly on a moist mash ration, and it is well to use it once a day when rapid growth is desired, especially if it can be moistened with sour milk, but I have never found that a meal of moist mash, even twice a day, quite takes the place of the always accessible dry mash. "Little and often" is the rule for feeding of all fowls. It is the way they like to eat, and we are going against nature when we compel them to fill their crops in a few minutes. If the mash is left standing before them, so that they may eat when they will, there is always the chance of its souring or becoming contaminated, and the still greater chance of waste.

The use of sour milk is one of the greatest economies, since it takes the place of the expensive animal and vegetable protein in the shape of meat meals and the various oil meals and bean meals. I should like to see the experiment tried of feeding hens and growing stock on green alfalfa and sour milk with a minimum amount of grain. I believe there would be a very great saving of grain with a corresponding increase in the health of the birds. Some whole grain is of course a necessity, and it is hard to see how bran could be left out of the dietary, but there seems no good reason why unlimited access to these two nitrogenous foods should not greatly reduce the grain bills. Sour milk is a by-product too valuable to waste, and those who have figured the thing out say it brings a greater profit when fed to chickens than when given to hogs. When milk is used it should be served in vessels which keep it from the contamination of the chickens' feet and which can be thoroughly cleaned, for a dirty milk vessel soon becomes a source of disease. The pan or fountain should also be placed on a wooden platform where it cannot be spattered onto the ground, for the soil on which milk has been spilled soon sours and becomes a breeding place for gape warms. Properly fed, milk is one of the cheapest and most valuable of poultry foods.

Is there any economy in cutting down the ration? Yes and no. Many of the hens in our back yards today would be better off with less food, but the caretaker needs to study the needs of his flock, and not cut down the feed simply for the sake of saving. When hens are laying well and not over fat they may be assumed to be eating the right amount. When they feel soft and flabby in the abdomen, and sit around in the sun instead of hustling for food, they will probably be better off for a less liberal ration. The hen whose crop is empty when she goes to roost, either is underfed or lacks the appetite she ought to have.

A liberal use of green feed, other than alfalfa, and of waste vegetables, is a help in saving grain. Hens should have all the green they will eat at all times. It is better to keep it always before them, so that they may nibble at will. On one of the most up-to-date ranches in California I saw the breeding pens supplied not only with boxes in which alfalfa was kept growing under a wire, but with pans full of cut up greens at which the birds could pick all day. When Emperor William, a few months ago, urged his people to feed every scrap of vegetable waste from their kitchens to their domestic animals and fowls I don't suppose he was thinking about economy in feeding hens, yet the suggestion is worth while. All sorts of vegetables and vegetable skins may be cooked and chopped and fed to chickens either in a moist mash or by themselves. I have seen the use of small potatoes in this way advocated repeatedly, and one eastern expert goes so far as to say that potatoes cut up raw make one of the best of feeds for chicks. Here on this coast we can hardly call potatoes a cheap feed, and they are undoubtedly too fattening for heavy birds, if fed liberally, but the skins and potatoes too small to be marketable may often be utilized in this way.

The use of stale bread, when one is within reach of restaurants and bakeries, is another economy. The only trouble is that it is quite likely to be moldy, and moldy bread can never be safely fed to any bird. When the bread is free from mold it can be soaked and mixed with cooked vegetables and a little bran into a most economical mash.

Gilbert Hess
Doctor of Veterinary Science
Doctor of Medicine

Now is the Time Your Hens Need a Tonic

Moulting weakens a hen—it brings her vitality down to low ebb. To help the hen over this period you ought to feed her a tonic to keep her system vigorous, well able to force out the old quills, grow a new feather crop and get back on the job laying eggs well before the winter sets in. Keep your hens toned up.

What your hens need right now is Dr. Hess Poultry Pan-a-ce-a. This splendid tonic is the result of my lifetime experience as a doctor of veterinary science, a doctor of medicine and a successful poultry raiser. It tones up the dormant egg organs, offsets the weakening effects of moulting, quickens quill shedding, makes for a new feather growth and makes hens lay.

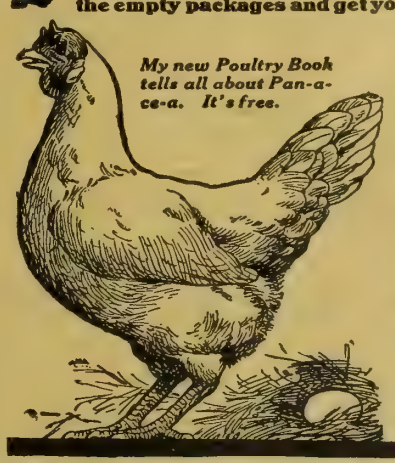
Dr. Hess Poultry Pan-a-ce-a

Not a Stimulant, but a Tonic

Shortens Moulting Period—Makes Hens Lay

This is also a splendid tonic for fattening poultry for market. It helps the birds digest the maximum amount of their ration and convert it into flesh. It keeps poultry healthy and fit while cooped up. Besides, my Poultry Pan-a-ce-a is an excellent constitutional remedy for roup.

So sure am I that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy, make hens lay, help chicks grow and shorten the moulting period, that I have authorized my dealer in your town to supply you with enough for your flock and if it doesn't do as I claim, return the empty packages and get your money back.



My new Poultry Book tells all about Pan-a-ce-a. It's free.

Sold only by reputable dealers whom you know, never by peddlers.

Buy On My Money-Back Guarantee

West of Rockies: 1½ lbs. 25c; 3 lbs. 50c; 7 lbs. $1.00; 25-lb. pail $3.00. Pan-a-ce-a costs only 1c per day for thirty fowl.

Dr. Hess Stock Tonic

Taken off pasture, put on dry feed and closely confined, your stock are apt to get out of fix during winter. Some are liable to get constipation, dropsical swellings, stocky legs, but most common and dreaded of all diseases, especially among hogs, is worms—worms. Dr. Hess Stock Tonic will keep your stock toned up, enrich their blood, keep their bowels regular and will rid them of worms. West of Rockies: 25-lb. pail $2.25; 100-lb. sack $7.00. Smaller packages in proportion.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or keep it in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans. West of Rockies: 1 lb. 25c; 3 lbs. 60c. I guarantee it.

DR. HESS & CLARK,
Ashland, Ohio.

COULSON'S EGG FOOD

Contains every ingredient that hens need—mixed just right to give a balanced ration—makes hens lay longer—keeps them healthy—pays for itself by increasing egg production—saves your time —puts money in your pocket.

Scientifically mixed by machinery from a formula based on years of experience.

Get COULSON'S EGG FOOD from your dealer. Send for Free book "Chickens" to

TREES

Rialto Seedless Lemon Trees—Write or phone for Brief History and it will be mailed to you. The coming Lemon for California. Also Seedless Grapefruit—Valencias, Washington Navels—Eureka and Villa Franca Lemon—Mexican Lime—Ganter and Harmon Avocado Pears. We are making special inducements to planters. Prices on application. We have first-class stock and can make deliveries from San Bernardino, San Diego and Los Angeles Counties. We are not jobbers but selling our own grown trees. Buds selected from the best bearing trees. 25 years in Southern California growing and handling citrus trees. Yours for good business.
CALIFORNIA ORCHARD DEVELOPMENT CORPORATION
303 South Hill Street
Main 884 Los Angeles, Cal. F-7406
or
Cyrus W. Wilhite
Home 303 Glendora, Cal.

Lease Expires Next Spring—Must sell. Have left about 2,000 Eureka lemons, three-quarters inch and up, buds selected from trees producing heavy crops of fancy fruits. 2,500 Valencia Late five-eighths inch up, 2,000 Marsh Seedless grapefruit five-eighths inch up. These are stocky and especially adapted for desert planting. Will sell with loose roots or balled. Prices as follows for loose roots: Eureka lemon, three-quarters up, $16.00 per hundred; Valencia Late, five-eighths up, $15.00 per hundred; Marsh seedless grapefruit, five-eighths up, $12.50 per hundred. All information cheerfully given. E. J. Van der Sluis, Glendora, Cal.

For Sale or Trade—Finest two-year-old Washington navel and Valencia trees in the country. Tops especially grown 3 to 5 limbs. Budded by myself from good old bearing trees, no sucker buds. Will sort to any size if preferred. Price, 20 cents loose roots; 25 cents balled f. o. b. Glendora. Also fine sour seed stock, $500 per 1000. All inquiry cheerfully answered. Will trade for anything I can use. B. C. Dodson, Glendora, Calif.

Very Fancy Citrus Stock—Eureka Lemons, Valencia and navel oranges and Marsh Seedless grapefruit. Very strong one and two-year-old trees, heavy root growth. Very low prices. Get our quotations for any quantity wanted. Smith Citrus Nurseries, 619 Oakland avenue, Pasadena, Cal. Colorado 4089. Los Angeles office, 315 Marsh-Strong Bldg., Main 3604, F-2729.

AVOCADO TREES
Investigate the wonderful Avocado industry. A ranch planted now will make you independent in a few years. Write for further information and literature. Vigorous field-grown budding trees of standard frost-resistant variety, from four to seven feet high, $1.50 to $2.00. W. A. Spinks, Duarte, California.

For Least Work, largest and quickest profit plant now LUTHER BURBANK AND MEDITERRANEAN SPINELESS CACTUS. Our citrus trees are not the lowest priced, but the cheapest, best. ROBINSON CITRUS NURSERIES, R. F. D. 35-A, San Dimas, Cal. Covine phone 902.

Prices Reduced—Ganter and Harman Avocados, 4 to 7 ft., extra fine field grown trees with large, even heads; on rented ground and must be sold. Our prices will surprise you. Citrus also reduced. Magnolia Nursery, Whittier, Cal.

Eureka Lemons, Late Valencia, Washington Navels—⅝ up. Thrifty, clean stock 20c open root, 25c balled. Quality considered, you can not beat it. Call or write Wilbur K. Howard, Loraine avenue and Santa Fe crossing, Glendora, Cal.

For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoas, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

For Sale—Navel, Valencia and lemon trees, three-quarters inch and up, 20c loose root, 25c balled. Budded Avocados, 4 to 7 feet high. Address Box 54, Glendora, Cal.

The 1200-Acre Nursery, growers of 1500 varieties of trees and plants. OREGON NURSERY CO., Orenco, Oregon. Sales office, 522 Chamber Commerce, Los Angeles, Cal.

Budded Avocado—Select field-grown trees of standard varieties for the home or orchard. Sapota, Feijoa, etc. Catalogue free. Semi-Tropic Nursery, Monrovia, Cal.

Very Fine Sweet and Sour Orange Seed-Bed Stock — PRICE REASONABLE. MIGHT TRADE FOR GOOD AUTO OR TEAM. ORANGE COVE NURSERIES, OROSI, CAL.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holve, Fullerton, Cal.

Challenge Avocado Trees—We have some — first come, first served — they are scarce. C. T. James Nurseries, 210 Braley Bldg., Pasadena, Cal.

For Sale—Avocado and citrus nursery. Cheapest proposition in the country. Write for particulars. Martin Fesler, Covina, Cal.

100,000 Citrus Trees—Choice Seedlings and Buds. Wanted, a budder. Butler's Morning Side Nursery, Lamanda Park, Cal.

For Sale—Field-grown budded avocados, Harman, Ganter, Taft; 2 feet to 7 feet high, $1.00 to $3.00. Home Phone 444. A. B. Rogers, Glendora, Cal.

You should plant my olive trees. They are SELECTED from good bearing trees. Bishop's Nursery, Highland, Cal.

Nurserymen—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Cactus and Trees—Cash Nurseries, Sebastopol, Cal.

TREES

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

SEEDS AND PLANTS

Sudan Grass Seed—Pure, recleaned, clear of Johnson grass, 20c lb. cash, orders of 20 lbs. or over 15c lb. Sudan grass makes better feed than Cane or Millet and twice as much per acre; can be sown any time in May or June. 3 lbs. of seed per acre makes hay crop in 60 days, and seed in 90. Instructions for planting, cultivating and harvesting with each order. F. M. Grundy, Lubbock, Tex.

Spineless Cactus — Plant now. Tremendous yield of our plants makes possible these prices: Per 100, $10; per 1000, $75. Special collection of 20 fruiting and forage varieties, only $3. Parent stock purchased direct from Luther Burbank. El Dorado Cactus Nursery, Cupertino, Cal.

Burbank Spineless Cactus—Hardiest varieties, "Melrose" and "Special." Strong, matured slabs. $8.50 per 100; $50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

$udan Gras$ and Spineless Cactus—Plenty of time to plant these wonderful drouth resistants. Write now. Special prices; also Giant Rhubarb. BLACK BROS. NURSERY, 455 Lucas, Los Angeles.

For Sale—Yellow sweet potato plants, $1.50 per thousand F. O. B. Santa Ana, Cal. S. D. Teel, R. D. No. 3, Box No. 8, Santa Ana, Cal.

Attention Dairymen—Plant Sorghum for green feed or ensilage. Seed for sale in lots to suit. A. L. Sayre, Madera, Cal.

FARM LANDS FOR SALE

VICTORIA, AUSTRALIA, WANTS SETTLERS
Special inducements; government land, railways, free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa, corn, grains, fruit, etc.; climate like California; ample markets; reduced passages; special excursion being arranged. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

OREGON ORCHARDS

Ten acres or 40 acres 5-year-old Oregon apple orchard for sale. A No. 1 condition. Get our free booklet describing these orchards. We may consider some exchanges if you have good property to exchange for Oregon lands.

Dudley Moulton, 1202 First National Bank Bldg., San Francisco, Cal.

Exchange—Wanted a dairy and chicken ranch from $5,000 to $8,000 for San Francisco improved and unimproved property. No agents. F. D., 662 Lisbon St., San Francisco, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—You can own your own 10-acre ranch and home with water for $750.00, $150.00 cash and $150.00 a year; 7 per cent interest, in Fruitland Colony Lands. F2467. 1005 S. Main St., Los Angeles, Cal.

For Santa Clara Valley properties, improved or unimproved in vicinity of Palo Alto and Stanford University, call on or correspond with BYXBEE & SLOCUM, 101 Lytton Ave., Palo Alto, Cal.

I have some cash buyers for salable farms and ranches, owners only, write C. C. Buckingham, Houston, Texas.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

For Sale or Trade — $500.00 equity in $950.00 lot just out of Los Angeles. Will consider Ford or what have you? B. C. Dodson, Glendora, Cal.

Dairy Ranch, 6 miles west Napa. To lease, 1400 acres. Well watered. cross fenced. F. L. Morehouse, Napa.

MUSICAL INSTRUMENTS

We repair, buy, sell and exchange musical instruments; used instruments, good as new, sold cheap. Write for bargain list. Bolander's Fiddle Hospital, 52 Second street, San Francisco.

Girard Piano Co., 3d floor, 517-519 14th st.; take elevator and save $100 on your piano or player-piano; splendid values; used pianos, all makes, $75 up to $200; liberal terms; pianos rented $3 per month up. Phone Oakland 4571.

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

Bosworth's Imperial Red New Zealand Hares sold at hard times prices. NOTHING BETTER. Geo. M. Bosworth, Geyserville, Cal.

Caldwell's Royal Red New Zealands scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

KODAK FINISHING

Developing, 10c per roll. Printing, 2¼x3¼, 2½c; 2½x4¼, 3c; 3¼x4¼, 3c; 3¼x5½, 4c. Denver Store, 706 S. Hill St., Los Angeles.

POULTRY

Just Out—The Cultivator Poultry Book, "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions—it tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price $1.00 postpaid, or with Cultivator one year, $1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

Baby Chicks—Rhode Island Reds and White Leghorns. My guarantee safe arrival, full count, strong, vigorous; fine bred chicks, Leghorns, $9.00 per 100. Will lay in five months. Reds, $11.00 per 100. Will lay in six months. J. W. Lyon, Gardena, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately . National Poultry Co., 607 E. Third St., Los Angeles, Cal.

Petaluma Hatchery—The one that's different. We challenge the hen, or anybody else. Don't compare prices, compare quality. Circular free. L. W. Clark, Petaluma, Cal.

Single Comb White Leghorn Pullets—Two months old, also yearling hens and breeding cockerels at reasonable prices. Model Poultry Farm, Corning, Cal.

Chicks—Day old chicks from my healthy, vigorous, heavy-laying, free range stock of S. C. White Leghorns. Price $6.50 per hundred. H. P. Hansen, R. 4, Box 177, Petaluma, Cal.

Trapnested White and Buff Leghorns, records 120-279 eggs per year. Eggs, chicks, stock. Arthur R. Schroeder, R. 18, Box 179-D, Mountain View, Cal.

Revenue Strain—White Wyandotte eggs, $3.00 for 15, from prize winning stock; 221 pen average, chicks 25c. Mrs. W. L. Duvall, Franklin Ave., Pomona, Cal.

Barred Plymouth Rocks—"The kind that Lay and Win." Choice stock for sale. Catalog free. C. H. Vodden, Los Gatos, Cal.

At Your Service 365 Days in the Year—First-class chix; eggs for hatching, eight breeds. Hawkeye Hatchery, Turlock, Cal.

For Sale—Barred Rock Cockerels, also Barred Rock, R. I. Red, Anconas, Buff and White Orpington chix. Enoch Crews, Santa Cruz, Cal.

MACHINERY

USED RANCH MACHINERY, PUMPS, WINDMILLS, TANKS, ENGINES, HAY MACHINERY, PUMPING PLANTS, SPECIAL SNAP, PRACTICALLY NEW
38 H.P. White Middleton engine complete with $65 friction clutch, $75 belt, 5 two-step B. J. centrifugal pump with frame, shafting, pipe, fittings, pulleys, gates, 50,000 gal. redwood tank, 30-ft. stand. Take entire plant for $1200, engine alone cost $1500, or will separate.

1½ H.P. new engine	$25
3 H.P. Olds, fine shape	65
4 H.P. Peerless	65
5 H.P. Stover	85
20 H. P. St. Mary's	195
25 H.P. Lambert	295
60 H.P. Columbus, new	900

WHY BUY NEW? SAVE HALF
MATERIAL GUARANTEED
PUMPS—PIPES—CYLINDERS
Double - acting LUITWEILER pump, complete with cylinder, pipe and rods, $325; pump alone cost $680. Bulldozer jack, $32; many other pumps, all kinds and sizes.

WINDMILLS, TANKS
8-ft. mills, $19.50; 10-ft., $27.50; 12-ft., $45. NEW 1000-gal. tanks, $19.50; 2000, $29.50; 3000 used redwood and stand, $30; 30,000 redwood like new, $125; many others 50 gallon up. FINE wagon and tank, $75; H. P. BALER, $90; SOUTHWICK power baler, $350, cost over $700; WHITMAN power baler, $200. Steam tractor with complete baling outfit, $600.
Mowers, Rakes, Sprayer, harrows, potato, beet machinery, Fan Mill, Corn Sheller, Ensilage Chopper; small ranch tools.

ENGINES, PUMPS, BOILERS
Eighty H. Boiler, Smith Valle Steam engine 14x18 and Compressor 12x18, $1000, cost $6000. Absolutely cheapest serviceable material can be produced for. Pioneers in our line. DEMMITT CO., UPSTAIRS, 120 N. Main, Los Angeles. Yard, 816 Yale. Buy Tools of All Kinds.

For Sale—Used and new Gas Engines, 2 H. P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild Gas Engines correctly. Get prices. Lloyd, 806-808 N. Main St., Los Angeles. F7020—Broadway 4103.

For Sale—40-Horse Power Distillate Engine, nearly new. Near Pasadena. Address Box 144, Altadena, Cal.

WANTED

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property free. American Investment Association, 12 Palace building, Minneapolis, Minn.

Wanted—Cows, calves and weaned pigs or cash in exchange for spineless cactus or citrus trees. LUTHER BURBANK AND MEDITERRANEAN SPINELESS CACTUS PLANTATIONS, SAN DIMAS, CAL. Covina phone 902.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

DUCKS

Mammoth Pekin Indian Runner Duck Eggs, $1.00 per eleven. Black Minorca and Ancona Eggs, $1.50 per fifteen. Mrs. W. L. Duvall, Pomona, Cal.

Select Pekin and Indian Runner Duck Eggs. Ducks all ages. Special prices. Black Bros., 455 Lucas, Los Angeles.

LIVE STOCK

Billiken Herd—Pure bred, registered. O. I. C. Swine. The Big White kind. Sows now farrowing. Three herd boars used; new blood lines. Weaned pigs will be ready soon for shipment. Cholera immune; first class in every way. Make your reservations now for singles, pairs and trios. Write for my new circular. C. B. Cunningham, Mills, Sacramento County, Cal.

Hogs—Forty head of BIG TYPE POLAND CHINA boars of any age. Sired by IOWA WONDER, who is a son of A WONDER, the greatest hog living or dead. No females to sell at present. On account of large number on hand will make special prices. Geo. A. Smith, Corcoran, Cal.

A FAMILY INDUSTRY

"Now," said Mr. Jones energetically, "I think it's high time, Jimmie, that you began to learn something, and I am going to teach you. We will begin by counting the people in our family."

"Yeth, sir," said Jimmie.

"Now, mother is one, and I am one, so that makes two, doesn't it?"

"Yeth, sir," said Jimmie.

"And now, grandma is one more, and she makes how many?"

Jimmie looked interested, but doubtful.

"Three, isn't it?" prompted father.

"Yeth, sir," said Jimmie.

"And now, there's grandpa. He makes—how many? Four, isn't it?"

"Yeth, sir," said Jimmie.

"And then there's Aunt Ellen. She makes—how many? Five, isn't it?"

"Yeth, sir," said Jimmie.

"And then, there's Uncle Stephen. He makes—"

"But daddy" exclaimed Jimmie, "do they all make hominy?"

WUFF

"You used to call me kitten," cried
His wife to Binks, the surly pup.
"I did, but since then," he replied,
"I've found that kittens will grow up."

"Dinah, did you wash the fish before you baked it?"

"Law, ma'am, what's de use ob washin' er fish what's lived all his life in de water?"—Philadelphia Ledger.

QUESTIONS AND ANSWERS

(Continued from Page 632)

tions, haversack or lunch rations, travel rations, Philipino or extra rations and emergencies rations. Men are like animals, though we should at least give them credit for more intelligence in what they should eat, and from my experience I would give the individual credit for knowing more nearly what he requires to keep healthy and in condition to properly do his work than any one man or chef would be able to tell him.

I think the inquirer would get more harmony and work out of the men if he gave them a little too much than not enough. The rations issued by Uncle Sam, where available, give just a little bit more than the ordinary man cares for and I don't know who has things figured out to a finer science than the officers in charge of the United States Army.—Capt. Bert I. Demmit, N. G. C., Los Angeles.

Feed for Cow

What is the best feed for family cow where green feed is not available? Have no ensilage. Wish to feed for quantity of milk.—Subscriber, Covina.

If it is not possible to plant corn for soiling crop, nor beets nor pumpkins, why not use dried beet pulp? We assume you have sufficient alfalfa, which is the milk-maker. However, you need an appetizer or some feed containing succulency, and if unable to grow the green feeds the dried beet pulp is perhaps one of the best feeds.

Loquats Not Bearing

I have two large loquat trees, one a budded fruit. During the past two seasons they have borne very little fruit, but make a big growth of leaves and branches. Can you tell when and how a loquat should be pruned to bear fruit?—Subscriber, Azusa.

You do not state how old your trees are. Age often has a great deal to do with their bearing. Should they fail to bear after they have completed their rank growth, try a little fertilizer on them, containing phosphoric acid and some potash, little or no nitrogen. Pruning would only promote more growth and reduce the bearing surface. However, some pruning is desirable, as it is necessary to strengthen the branches when the trees bear very heavy crops.—J. W. M.

Sheep for the Orange Grower

In a recent issue you had a short but very interesting article, signed "W. S. G.," on the different varieties of sheep. The gentleman evidently knows sheep. Now, I want to ask him for a longer story. I am an orange grower and am thinking seriously of raising enough sheep to supply my family and my neighbors with mutton, killing perhaps one animal per week. We are told that a ton of alfalfa hay is worth $9 to an orange grower as fertilizer. I am keeping four cows and supplying the neighborhood with milk, the profit and the resulting fertilizer making it a paying venture. If the alfalfa is fed to animals and all the manure is saved its value as fertilizer should be nearly as great as if applied to the soil in the form of hay. I am preparing to keep all stock on cement floors, generously bedded with straw as an absorbent, the manure to go into a spreader and be applied to the land each day. What I want to ask of W. S. G. is this: Will sheep thrive in close confinement if all other conditions, feed, water and shade, are good, and how would you proceed to get into the venture? I may say in explanation that the use of cover crops and animal manures seems to have eliminated mottled leaf from my orchards, but that I must have more manure. I am too far from any source of supply to get it at a reasonable price and I am trying to satisfy myself that I can afford to produce it at home.—Orange Grower, Highlands.

You certainly can keep sheep under the conditions you mention and they should be a valuable adjunct to your proposition in every way. There are very few fruit farms in the state that would not find it a benefit to have a small band of sheep to keep roadsides clean, to keep down weeds in corners and to be general "vegetable scavengers." In order to get this cleaning up work done it will be necessary to herd them and have a place such as is suggested where they will be kept in rather close quarters and fed for a greater part of the time, but they will stand this confinement all right, particularly the heavier breeds like the Shropshires, Oxfords, Hampshires and Dorsets. As was indicated before, if there can be a small pasture or a good sized paddock that they may have access to it will be better, but the occasional grazing along the roads and around the place will afford considerable exercise.

If you follow out this plan and make a market for this delicious, well finished mutton that you will be able to produce, you will have a patronage that no one can touch. The best mutton grown is that which is raised and fed on small farms.

As to getting into the business, an inquiry in the Cultivator should put you in touch with some one who has some mutton ewes for sale. Then use a good, pure bred ram on them. If there is anything further that can be suggested let us hear from you again, for this is a subject that should be of a great deal of interest.

Squirrels and Rabbits

Please give formula for spray or dust bath for young pumpkin plants to prevent them being eaten by squirrels and rabbits, something which will not injure the plants?—Subscriber, Ontario.

The best method to pursue in this case is to poison the squirrels and rabbits. Any poison applied to the vines of sufficient strength to prevent squirrels and rabbits eating them would also no doubt prove injurious to the vines. In any case it is against the law to harbor squirrels on land in California so you should see that they are destroyed or, if they come onto your land from adjoining lands owned by other parties, the owners should be requested to abate the nuisance. If they do not do so your horticultural inspector or county board of supervisors have power to act in this matter. At this period of the year fruit bait is excellent to use for poisoning. Apples or almost any fruit with strychnine will aid materially in reducing the pest, though more effective eradication is accomplished by the use of gas, the application of which has been described in former Cultivators. It is possible that a liberal distribution of dried blood will frighten away the pests. Rabbits especially avoid anything with strong animal odors. Besides the blood is one of the best fertilizers.

Best Variety of Avocado

What variety of avocado would you advise planting for home use 50 miles from the coast, where the temperature frequently goes down to 28?

F. O. Popenoe of the West India Gardens answers:

Replying to your inquiry as to best variety of ahuacate to plant where the temperature "frequently goes down to 28" will say that the thin-skinned Mexican varieties are somewhat hardier than the larger fruited thick-skinned varieties and will probably be a safer kind for your correspondent. They will stand a temperature of 28 without any trouble. The Northrop, Chappelow, Harman or Ganter will succeed where it is that cold and colder.

If the temperature does not go below 28 he can plant the larger fruited varieties by giving them for the first few years some winter protection. The trouble is that where the temperature "frequently goes down to 28" it occasionally goes lower. But by using a little care to protect his trees during the colder periods he will be safe in planting also the Taft, Sharpless, and Blakeman.

Ringrolling

In your article on culture of beans you refer to "ringrolling" the land. What is this process?—Subscriber, Porterville.

Ringrolling is a term applied to the process of rolling the land with a corrugated roller.

THE CROAKER

Once on the aidge of a pleasant pool,
Under the bank where 'twas dark and cool,
Where bushes over the water hung,
And rushes nodded and grasses clung,
Jest where the crick flowed outer the bog,
There lived a grump and a mean old frog,
Who'd set all day in the mud and croak.

Till a blackbird hollered, "I say, yer know,
What is the matter down there below?
Are you in trouble, er pain, er what?"
"Nothin' but mud and dirt and slime
For me ter look at all the time;
It's a dirty world!" so the old frog spoke,
"Croakity-croakity-croakity, croak."

"But yer lookin' down!" the blackbird said;
"Look at the blossoms overhead;
Look at the lovely summer skies;
Look at the bees and butterflies;
Look up, old feller. Why, bless yer soul,
Yer lookin' down in a mus'rat hole!"
But still with a gurglin' sob and choke
The blamed old critter would only croak.

And a wise old turtle, who boarded near,
Sez to the blackbird, "Friend, see here:
Don't shed no tears over him, fer he
Is low-down jest 'cause he likes ter be;
He's one er them kind of chumps that's glad
Ter be so mis'rable-like and sad;
I'll tell yer somethin' that ain't no joke,
Don't waste yer sorrow on folks that croak." —Exchange.

PROFITABLE GARDENING FOR WOMEN

Written for California Cultivator
By Roberta Rollins

THERE are many women engaged in office work who are longing for a change to some occupation that will take them out of door in the open air and away from the crowds and noises of the city.

They have worked long hours in poorly lighted and illy ventilated rooms, have lived a life of such hurry and at such a high tension that they are starving for sunlight and fresh air and quiet.

These women for the most part are dependent upon their work for their support or the support of others, and for that reason they are afraid to give up the salaried position they can fill as long as their work is satisfactory for the uncertainty of a new venture where all would depend upon their own efforts.

But the time comes when the woman whose hair is beginning to gray or whose nerves are on edge from the years of office work finds it harder and harder to secure a good position. There are so many bright, young girls coming out of the business colleges, inexperienced perhaps, but quick, bright and eager to learn, and somehow they secure the most desirable positions.

There are many opportunities open for such women if they have the courage and determination to make the change. Some of these opportunities are most interesting and fascinating and remunerative as well. Every woman has some one thing she likes and can do out of doors. One may have good luck in growing roses, another likes to grow vegetables, another is interested in growing fruits, still another may have a knack in handling cut flowers.

We know of two women, a mother and daughter, who have made a success in growing dahlias. They built up a good local trade at first and are now supplying some of the big eastern seed houses with their new seeds and bulbs. In speaking of their business they said they were both great lovers of flowers, liked to work with them and watch them grow. Their little bungalow home was surrounded with flowers which they had grown.

They selected dahlia growing because in the locality they lived they were hardly known to any extent at least, so they had something new to offer the public. They spent several months reading everything they could find in the public library on dahlias and read and studied the seed catalogues, besides experimenting on a small scale in their own yard.

Then some time was spent in finding the right location as to soil and easy marketing and not too far from the city, for they did not wish to give up all the city comforts to which they had been accustomed. They found a small place of three acres, the kind of soil and slope they wanted, plenty of water, close to an interurban car line and on the main highway leading in to the city, with its steady stream of auto travelers who would be attracted to the place once the flowers were in bloom.

Her years of training in the business world had taught the daughter the value of system. So they began by making a plan of the three acres. This served not only for the purpose of planting but enabled them to lay out the ground to the best advantage as to location of walks and buildings. A tiny bungalow was built containing just the necessary rooms for the two of them. Climbing roses were planted which soon covered it with their wealth of foliage and flowers. Then a small office and storeroom for the bulbs and seeds was built near at hand but separated from the bungalow by a rose covered pergola. The remainder of the small caital was invested in the bulbs and seeds with barely enough left for running expenses. They had been fortunate in securing good terms on the land which enabled them to put more into first improvements.

Enough of the ground was reserved for their garden, which soon supplied them with their own vegetables and a few chickens furnished them with eggs, thus helping out materially on their living expenses.

The first season no attempt was

CANDY MAKING

This Difficult Art Greatly Simplified by Use of the Right Syrup

Many housewives who are considered excellent cooks experience a great deal of trouble in attempting to make good candy. Candy making, more than any other species of cooking, requires strict attention to directions, both as to quantities and methods.

One of the most important ingredients used in candy making is syrup—and the quality of the syrup used will go a long way toward making or marring the confection.

Many of the most noted culinary experts in the country, including the world famous Marion Harland, most strongly recommend the use of Karo Syrup for this purpose.

Among the many delicious candies which can be best made with Karo are Fudge, Fondant, Divinity, Caramels, Walnut Caramels, Cream Caramels, Chocolate Caramels, Peppermint Candy, Taffy, Yellow Jack, Cream Drops, Peanut Candy, Butter Candy, Butter Scotch, Sea Foam, Karo Wafers, Comanche, Cocoanut Candy, Nougat and many other kinds too numerous to mention.

Do not experiment with inferior syrups, but insist upon Karo. You can obtain it at all modern grocers. When ordering Karo ask for a copy of the little Karo cook book containing recipes for making all of the above candies, and many other toothsome dishes. Try each of these recipes and you will always keep Karo in the house thereafter.

made to sell bulbs but they were planted with an eye to their display from the public highway.

When the plants were in bloom people began stopping to see them. They were something new in flowers, which was one attraction, and as great care had been used in planting them as to their colors and variety, they made a fine showing. Many orders were taken for future seeds and bulbs while they were in bloom. A display at one or two places in the city also brought several inquiries and many visitors.

At the end of the third year they have as large a business as the two of them can handle. They have over 500 varieties, some selling as high as $2.00 apiece. They sell not only locally but are shipping some of the new varieties to eastern seed houses. The work is fascinating, for a new variety is frequently grown. They are learning all the time how to try for new colors and varieties and to improve the different strains. They have made it a financial success and the outdoor work has brought added health to both the mother and daughter.

Domestic science instruction has become so important in Germany that a special domestic science dictionary has been issued for the use of teachers and others interested in education for the home.

Housekeepers Should Know More About Cornstarch

Their Cooking Possibilities Greatly Increased by Knowledge of This Delicious Food Product.

If the average housekeeper should make a study of the diversified uses of one food product—Cornstarch—she would enlarge the range of her cooking possibilities immensely. In addition to constituting the basis of many toothsome desserts, cornstarch can be used incidentally with much benefit in many ways.

For instance, the housekeeper can prepare her own pastry flour by mixing cornstarch with her regular bread flour in the proportion of one part cornstarch to three to five parts of flour—according to the amount of gluten in the bread flour she is using. By lightly dusting a cake with cornstarch she can prevent icing from running off while being spread. A little cornstarch introduced into a juicy fruit pie, such as rhubarb, cherry, etc., prevents its running over. Cornstarch also is fine for powdering candies, such as marshmallows, etc., while it can be used in hundreds of other ways too numerous to mention.

To insure satisfactory results, however, it is essential that the best quality of cornstarch be used. This can be assured by insisting upon the famous Kingsford's brand, which can be obtained at all modern grocers. Those who obtain the best results with cornstarch recipes always depend upon Kingsford's.

Relief From Ants

How To Cope Effectively With This Intolerable Nuisance.

If you are one of the thousands of women whose homes are over-run with ants, you will be interested to know that an absolute riddance for this plague has been discovered. After long experimenting, a Los Angeles baker, whose shop was infested with ants, prepared a paste which not only drove every ant out of his place in one day, but prevented their ever getting a foothold again.

So great a sensation was caused by this discovery that he was obliged to put up the paste for general use—and a large factory is now required to manufacture the remedy in the tremendous quantities necessary to keep pace with the demand.

This little remedy is known as Kellogg's Ant Paste and can be obtained at all modern druggists. Try it today and you will always keep it in the house.

HOUSEHOLD QUERIES

Substitute for Linoleum

We think a great deal of the Cultivator and like the household department; it has so many fine recipes and helpful hints for housewives. I would like to know how to fix an old Brussels carpet, to take the place of linoleum, as I want to make the change.—Subscriber, Turlock.

Old Brussels carpet has been used for kitchen floor covering by cleaning and tacking on the floor upside down. Then apply two coats of paint. This will leave a finish that can be washed with warm water. A coat of shellac applied over the paint will keep it from wearing off and will give it a glossier finish. Many housewives apply the shellac to linoleum to prevent wear.

Mint Jelly

Please print in your household department a recipe for mint jelly.—Subscriber, Dehesa.

Two tablespoons gelatin, one-half cup cold water, two and a half cups boiling mint extract, three-fourths cup sugar, one-quarter cup lemon juice. Soak the gelatin in cold water 20 minutes. Dissolve it in boiling mint extract, which has been prepared by steeping three cupfuls of finely chopped mint in three cupfuls of boiling water for half an hour. The liquid will be reduced to three and a half cups in this process. Strain and add the lemon juice and sugar. Turn into a mold wet in cold water, and chill. Serve in individual molds if desired. To give a pronounced green color to this jelly, add a bit of green vegetable coloring matter.

Carrot Pudding

Among the excellent recipes in October 15, 1914, number of the "Cultivator" is a carrot pudding. I have tried this a number of times, adding orange juice for moisture. Please learn of the one who gave the recipe if she omitted some kind of a liquid because it is very dry without something—as the recipe reads. The German nut loaf given in the same issue is very nice, and a favorite with us. I turn to these pages first with a new number.—Mrs. F. A. Marks, Santa Ana.

Miss Rebecca Strutton of San Diego, who sent us the recipe for carrot pudding, writes:

"Please tell your subscriber that she might use less potato in carrot puding or if she flours the nuts to keep them from sinking she must use a little less than one and one-half cups as per recipe. Some flour is more pasty than others. Her orange juice is a wise addition and I will try it myself."

Candied Citron.

Please give method of candying citron. Should the fruit be ripe or green for best results?—Subscriber, Pasadena.

We assume our subscriber refers to the true citron of commerce and not to the citron melon. Regarding the handling of this fruit we quote from Coit's Citrus Fruits: "The fruit as it first begins to assume a bright yellow color is picked and placed in brine for a month or longer, the brine being renewed occasionally. Sometimes tender young leaves of the citron tree are soaked with the fruit to deepen the green color. The fruit is then boiled in fresh water to remove the salt and soften it. It is then halved, the pulp and seed scooped out; and immersed in cold fresh water to intensify the greenish color. After that it is covered with hot sugar syrup and allowed to stand three or four weeks, during which time the strength of the syrup is gradually increased. The fruit is then put into boilers with crystallized sugar syrup and cooked; then allowed to cool. More sugar is added and it is cooked again until it will take up no more sugar. It is then dried and packed in wooden boxes, each piece being coated with white sugar crystals and wrapped in tissue paper."

Heat your plates before putting hot pies on them when first taken from the oven. The hot pies on cold plates cause a sweat that makes soggy under crust.

UTILIZING NEWSPAPERS

Written for the California Cultivator By Georgina S. Townsend

The amount of good material that goes up in smoke in every home where newspapers are read, is amazing. It is easier to burn up old newspapers to get rid of them than to plan to use them to some advantage. After one has gotten into the habit of making use of papers, it looks like wanton waste to see them burned up as rubbish. Almost every California home has an air-tight heater. During the summer, as papers accumulate, it takes but a few moments at a time to twist them up, as the newsboy does when he throws them into the yard, and toss them into a box or barrel. When cool fall days come one has enough newspaper "wood" to keep the little heater throwing off spasms of heat, which is all that is necessary to take the chill from the room.

A great many uses can be made of papers in the housework. A number of layers folded together and cut in circles may be quickly stitched up on the machine into mats for setting hot kettles upon. As soon as they become black they are burned up in the stove. Paper may also be used to clean smut from kettles—then burned—and for wiping out greasy frying pans, nothing is better than soft papers. I save every sort of paper—packing paper, laundry paper, paper used about bread, etc. All have their uses, especially all soft and tissue paper.

The easiest way to clean windows is to wipe them with kerosene and polish with paper. The gas or coal range may be kept clean by rubbing with paper once a day. All vegetables may be cleaned and prepared on papers, which then can be folded up about the debris, and easily emptied.

A great help to anyone when ironing is a thick pad of papers upon which one may stand. It will be found very restful to one's feet.

It is an excellent plan to cut papers into whatever size one has need of, and have a shelf or place for them.

San Diego	.02	14.43	9.96	82	54

HAY

Under date of May 29, Scott, Magner & Miller say:

Arrivals of hay during the past six days have amounted to 3118 tons, a good part of which was for movement on export account.

Prices on low grade and medium hay remain unchanged, while an occasional consignment commands a little above top-most quotations. Alfalfa shipped into this market has been readily taken care of in the usual trade. None of the new crop has yet been baled for shipment.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	11.50@12.50
No. 1 Wheat or Wheat and Oat	9.50@11.00
No. 2 Wheat or Wheat and Oat	7.00@9.00
Choice Tame Oat	11.00@12.00
Other Tame Oat	6.00@9.00
Barley	5.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, per bale	.30@45

GRAIN

Alfalfa Seed	16½
Wheat, Cal. Club	2.22½@2.25

Shorts	30.00@31.00
Oilcake Meal	38.00@39.50
Cocoanut Oilcake Meal	24.00@25.00

Citrus Fruit Market

Los Angeles, June 2, 1915.

"Good oranges, good price; poor oranges, poor price," is about today's situation in the orange market. In other words, there is no keen demand but all the dealers are anxious to keep up their supply of good stock. This cares for all the good stock there is to forward. Indifferent stock has to take any price which is offered. There are perhaps 500 carloads of navels on sidings or in transit and when these are disposed of the Valencias will have command of the market. There are yet 7,000 or 8,000 carloads which will be ample to supply the trade until November.

There are 600 carloads of lemons on the way to market. In addition there are 300,000 boxes, or 750 to 800 cars, of lemons due to arrive in New York within the next ten days. Eastern weather is cool and very unsatisfactory from a lemon standpoint. Until the weather changes there is little hope for long prices. In addition there are in California packing houses 2,500 to 3,000 cars ready for shipment.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 25,936 cars, lemons 3,960, total 29,896. To same date last season: oranges 27,803, lemons 1,595, total 29,398. From Tulare County this season: oranges 5,536, lemons 197, total 5,732. To same date last season: oranges 5,259, lemons 30, total 5,289. From northern counties: oranges 629, lemons 2. Same date last season: oranges 405, lemons 5.

NEW YORK, June 1. — Twenty-seven cars navels, eight Valencias, two St. Michaels, two seedlings, two Jaffas, seventeen mixed cars, and five cars lemons sold. Market unchanged on both oranges and lemons. Fair.

CHICAGO, June 1.—Two holidays and a half holiday caused fruit consignments to pile up, and much of it suffered by the delay. Prices were shaded to unload the surplus stock. Cherries, California black, sweet, 10-pound boxes, 1.35@1.65; white sweets, 1.40@1.75; southern sour, cases, 24 quarts, 1.00@1.25. Peaches, California, boxes, 20 pounds, 1.75@2.00. Apricots, California, cases, 4 baskets, 1.75@2.00. Oranges, boxes, California, navels, 2.25@3.25; seedlings, 2.25@2.75; Valencias, 2.75@3.25. Lemons, boxes, California, 2.75@3.25. Cantaloupes, California, cases, 54 melons, 6.00; 12 to 16 melons, 2.00. Grapefruit, boxes, 2.50@3.25. Blackberries, cases, 24 pints, 1.00. Blueberries, 25@30 quart. Gooseberries, cases, 24 quarts, 1.00@1.50. Strawberries, cases, 24 quarts, 2.00@2.50. Apples, boxes, western stock, 1.50@2.00.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Hair Not Shedding.

I have a horse 15 or 20 years old. I give him all the oat hay he will eat and a gallon of rolled barley three times a day. He does not shed hair well. It is rough and stands on end. I can't get him to take on flesh. Have had his teeth looked after.—Subscriber, Los Gatos.

You are overfeeding the horse. Give him the medical treatment recommended below and reduce the feed one half: That means the hay as well as the grain. Get of your druggist: Aloin, one ounce, turpentine, three ounces, raw linseed oil, one quart. Mix, shake well and divide into three doses and give the three doses three days apart. Also get powdered gentian, four ounces, powdered nux vomica two ounces, bicarbonate of soda four ounces, and farina six ounces. Mix and give a tablespoon in the feed every night. Do not commence giving the powders until about a week after using the drenches.

Colic.

I have a young mare six years old. Think she is about four months with foal. She seems to be subject to spasmodic colic spells. Does not seem to bloat much. Sweats profusely. Is fed on good barley hay and rolled barley. Works right along and stays in barn. Seems healthy.—Subscriber, Lindsay.

The following tonic will probably relieve her. Powdered gentian four ounces, powdered nux vomica two ounces, bicarbonate of soda four ounces and enough ground fenugreek to make one pound. Mix and give a tablespoon in the feed once a day. A handful of ground flaxseed in the feed once a day will have a tendency to relax the bowels a little and help some also.

Catarrh.

My horse has constant watering of both eyes. Nose also runs water slightly. Condition appears chronic. Is it a cold? What can I do to check the trouble?—Subscriber, Highland.

This is probably the result of a cold. Some powders for the blood will probably dry it up. Get powdered gentian six ounces, and sulphate of iron leaves two ounces, and sulphate of iron two ounces. Mix and divide into 16 powders. Give one powder every night in the feed.

Hard Milkers.

Some of my young cows are very hard to milk. Is there any good, safe remedy? The holes in the teats seem to be too small.—Subscriber, Hemet.

The openings in the teats can be enlarged by cutting or stretching the sphincter muscle that surrounds the opening. In cutting great care must be exercised as one is liable to do more harm than good. It is better to stretch the opening by inserting an instrument for that purpose. There are several different kinds that can be purchased from veterinary instrument manufacturers. Some are of the form of a collar button. These can be inserted after milking and left until the next milking. The instruments are of different sizes, and by using the small ones at first and changing to the larger ones you will soon get the result desired. The instruments should be kept clean so you will not introduce any dirt that will irritate the parts and cause inflammation.

Bloody Milk.

Goat gave birth to twin kids one week ago. The kids were well developed but both were born dead. The doe was off her feed at first but is now eating better. She has gradually come up in her milk until she now gives nearly two quarts per day. There are bloody settlings in the milk after it sets a few hours and her udders seem tender but there is no indication of sores. Is there a remedy for the bloody milk?—Subscriber, Pasadena.

Gife her a physic of four ounces of epsom salts, two ounces of common salt and a teaspoon of ginger. Dissolve it all in a pint of hot water and give at one dose as a drench. Also get about three pounds of ground flaxseed (with the oil left in) and give a small handful in the feed once a day.

Rheumatic.

We have a one year old colt that has an enlarged stifle or stifle lameness. When she was about six weeks old she got an enlargement on the left knee and also one on the right stifle. We used some blistering salve and blistered both places. After a while both enlargements disappeared. This season the one on the stifle is there again. Bad enough to prevent her from trotting free. It does not hurt her to pinch it a little.—Subscriber, Escondido.

Have your druggist prepare the following: Nitrate of potash four ounces, salicylate of soda one ounce and bicarbonate of soda one ounce. Mix and divide into 20 powders. Give one every morning. Also iodide of potash one ounce and water enough to make one pint. Give a tablespoon of this every evening.

Inflammation of Joint.

An 11-year-old horse had a nail stuck in stifle joint. Cleansed the wound with syringe and carbolic acid and applied liniment. This has apparently not relieved the pain. I fear the nail has injured bone.—Subscriber, Alpaugh.

A blister is the only thing that will do any good now. Have your druggist prepare this: Cantharides one ounce, biniodide of mercury one ounce and axunge six ounces. Mix. Rub in well and tie the horse so he cannot reach it to bite it for 24 hours. Then grease the parts well with lard. Repeat this every two weeks until the lameness is gone.

Farcy.

I have a horse that has a disease called "button farcy." Will you please give cure?—Subscriber, Chicago.

There is no disease known to the profession by the name of "button farcy." If it is genuine glanders or farcy there is no known cure for it. If your horse has small swellings under the skin which sometimes follow distemper or influenza, he may get relief from the following. Have your druggist prepare this: Creosote (Beachwood) four drams, eucalyptus oil four drams, carbolic acid two drams and alcohol enough to make one pint. Mix. Give half an ounce morning and evening. Get a syringe and inject the medicine into the mouth.

Horse with Kidney Trouble.

Have a horse which seems to have kidney trouble, requiring the services of a veterinarian after being driven. Is it possible to cure this trouble and what is the cause of it?—Subscriber, Vacaville.

Your description of the case is not very full. Try the following powders and if they fail to cure then write again giving fuller description of the symptoms. Get nitrate of potash eight ounces, bicarbonate of soda four ounces, and powdered digitalis leaves two ounces. Mix and divide into 16 powders. Give one powder in the feed every night.

SPRAYING POTATOES

(Continued from Page 634)

once a week than to make a double spraying once in two weeks. In the first two sprayings while the plants are small one nozzle per row may be sufficient, but when the plants become large at least two nozzles per row should be used. Large vines are especially liable to blight and should be sprayed very thoroughly. Such vines will be somewhat injured by the wheels of the sprayer, but the benefit from spraying will far outweigh the damage done.

A single spraying is better than none and will usually be profitable, but more are better. Spraying may prove highly profitable even though the blight is only partially prevented. It is unsafe to postpone spraying until blight appears. Except perhaps on small areas, it does not pay to apply poison alone for bugs. When it is necessary to fight insects Bordeaux mixture and poison should be used together. For the best results spraying should be continued as long as the plants live. It is a mistake to discontinue spraying because the weather is dry and no blight present. A late attack of blight may result in heavy loss from rot. As a rule those who spray most obtain the largest net profit.

The foregoing statements show that thorough spraying of potatoes every year has three distinct advantages which make it profitable: (1) It insures against loss from blight; (2) it protects against insect damage; and (3) it stimulates the growth and thus increases the yield.

Good Auto Roads

VENTURA COUNTY, CAL.

$550.00 IN CASH FOR PHOTOGRAPHS

OF Amiwud ROOMS

(TRADEMARK REGISTERED)

Amiwud is the world's most famous wall board. It is used for interior work --- Takes the place of lath and plaster. Used in finishing every room from attic to basement.

There are hundreds of Amiwud Rooms in California.
There will be hundreds more built this year.

Here's What We'll Pay for Photographs of Amiwud ROOMS

(TRADEMARK REGISTERED)

$25.00 each for the 11 best photographs
$15.00 each for the 11 next best photos
$10.00 each for the 11 third best photos

Easy Conditions

If You Have an Amiwud Room

—Take a photograph or snapshot of it, write us what you think of **Amiwud** and mail both to us. (Be sure to write name and address on photo.) We will enter the picture you send in the big contest.

If You Haven't an Amiwud Room

—And intend to build, or refit, a room, you'll want to know about **Amiwud.**

—Fill out coupon below and mail to us. We'll send you full information and name of local dealer selling **Amiwud.**

Contest ends November 15th. To every woman sending us a picture of an AMIWUD Room in her house we'll send a stamped sofa pillow top, guest towel or doll outfit, or a further selection from the famous Royal Society Package Goods.
California is divided into ten districts— three prizes for each district.
Three prizes awarded outside California.

Amiwud (TRADEMARK REGISTERED)

—was the first wall board made. It is widely imitated.
—we have $3,000,000 invested in factories on this Coast.
—**Amiwud** is tough and durable. Is cheaper than wood. Takes the place of lath and plaster.
—comes in several wood grains, or plain to be tinted any color.
—is easy to put up, lasts indefinitely.
—can be used in every room in the house.
—saves dirt and damp plaster in installing.

On Every Photo

Write name and address.
When **Amiwud** Room was built.
And name of store or contractor who supplied you with **Amiwud.**

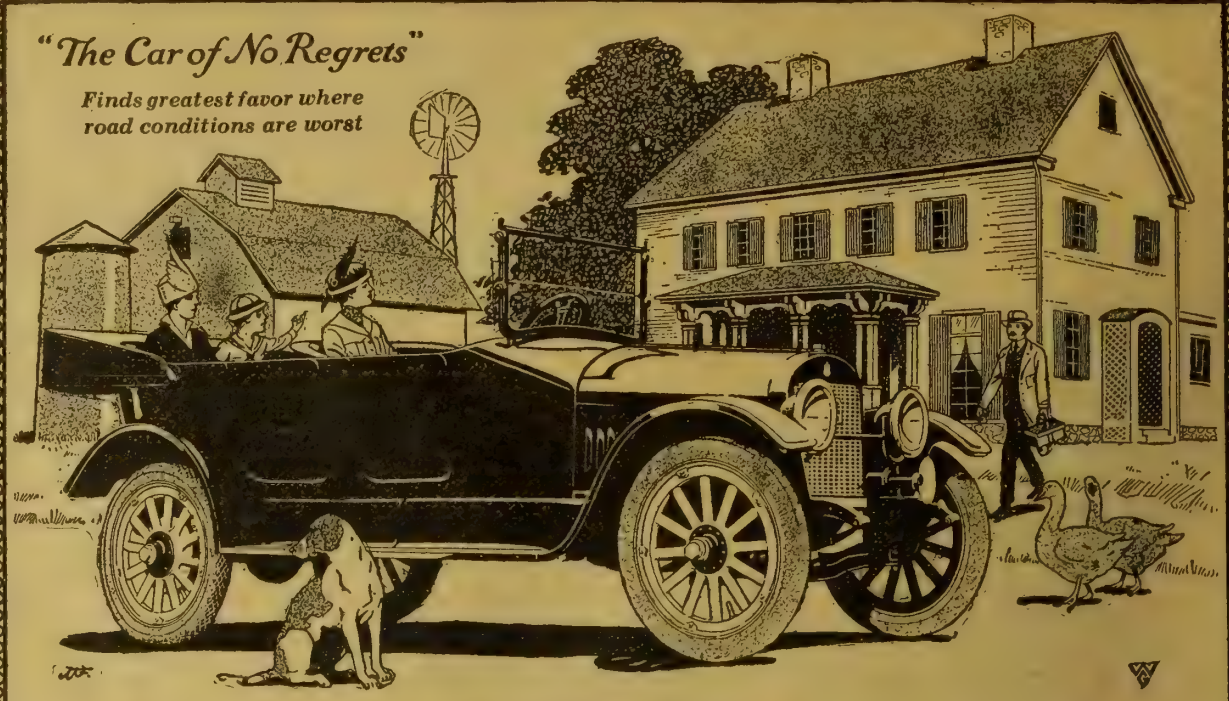
"The Car of No Regrets"

Finds greatest favor where road conditions are worst



KING EIGHT CYLINDER KING

$1350 COMPLETE

40-45 HORSE POWER

Out-Performs All Other Types

The extraordinary success of this super-car can only be understood by a ride behind its engine

A believable description of the King "Eight" in action defies even "advertising" English. It is a performance that must be "felt"—and exulted in.

The superior flexibility of an "eight" is beyond argument or dispute. It is an immutable mechanical fact that an "eight" has one power impulse for every 90 degrees of crank rotation, as against the 120 degrees of a "six" and the 180 of a "four."

This almost "turbine" smoothness of operation means *more* than the mere avoidance of gear-changing for practically all speeds and grades: It reduces vibration to nearly nil, which in turn results in silence and longevity and adds to riding comfort.

Notwithstanding its greater number of cylinders and 40-45 horse-power, the King "Eight" gives 15 to 20 miles to a gallon of gasoline and 800 to 1000 miles to the same measure of motor oil. Thus, low operating cost is added to the car's other virtues.

The King "Eight" is *not* an experiment, but the same successful type of car made by celebrated European builders for the past six years. It is King designed and King manufactured and has many thousands of miles of grueling road tests behind it. Enthusiastic owners all over America, and in many countries of Europe, are making King sales by their praise of this wonderful "eight."

What you should *now* expect from a motor car is taught by a King "Eight" demonstration. There's a King dealer in your locality.

Four Cylinder Model C—30-35 Horse-power—$1165 Complete

Two body styles for both "Eight" and "Four"—Touring Car and Roadster

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIV No. 23 LOS ANGELES: THURSDAY, JUNE 10, 1915 One Dollar Yearly

The Butte County Spring Exposition

Cultivator's Representative Present at the Fair Recently Held at Chico. The Attendance was Very Large. Great Interest Centered in the Stock Show

THAT district fairs and expositions have a large place in the great agricultural uplift movement that is making itself felt all over America is the belief of a number of enterprising citizens of Butte County, and their faith in this belief has been expressed in the holding of a particularly successful industrial and live stock exposition.

The first Butte County spring exposition was held on the Bidwell ranch grounds, in Chico, May 4 to 31, 1915. The attendance for the week was about 20,000, increasing every day until the close. There was an excellent display of live stock and agricultural products, one that was a credit to the managers of the show and the district.

There is probably no question but that the show will be held again next year, and if it is there will be a larger list of exhibitors and a larger attendance.

The greatest interest centered in the live stock show. A fine lot of horses were shown, good representatives of the dairy breeds of cattle, a few Shetland ponies, much fine poultry including a splendid show from the Mahajo farm, Perkins, of which H. S. Kirk is owner, and C. J. Struby manager, and a lot of high class hogs.

In the industrial exhibit were attractive displays of a number of land companies. Rice was shown as it grows in the fields. The Rodgers Sanitary Chicken House, made at Williams, and the Diamond Match Company of Chico had a model of their silo and a full line of bees keepers' supplies. All were well put up and the exhibitors should have been well rewarded for their enterprise.

The show was managed by J. A. Gorman of Gridley and he is entitled to great credit for the able way that all of the details were handled. He is a born exhibition man, and if there was a disappointed visitor or exhibitor on the grounds the Cultivator representative did not learn of it. But on every hand there was praise for the manager, the directors and the show in general.

The executive committee consisted of John H. Gill, Jr., A. G. Eames, W. B. Dean and J. A. Gorman. The live stock show was in charge of John H. Guill, Jr., W. A. Perley of Chico and H. L. Murphy of Perkins.

E. R. Neilson was in charge of the poultry show; C. E. Porter of horses and mules; Fred Peterson of flowers and plants; Theo. Schwein of olives and olive oils; C. H. Camper of the educational display; W. E. Luman of the food products; and the Butte County and Chico creameries of the dairy display.

Chico has a population of over 15,000 people, and is one of the most beautiful cities in California. It is in the heart of a very rich agricultural section and one that is making rapid progress at this time. All around Chico are profitable deciduous orchards. To the south at Oroville is one of the great citrus and olive districts of the state and the great rice fields of Biggs and Gridley. Just to the north is the attractive Los Molinos project and the Vina ranch of the Stanford University. Across the river is Corning with its groves of olives and all other varieties of fruit, Orland and the best irrigation project ever started by the reclamation service of the United States government, and the great project of the Sacramento Valley Irrigation Company, where the Kuhns of Pittsburg spent $10,000,000 before the failure of banks and other properties temporarily involved the financial affairs of the project but in no way interfered with the interests of the settlers or of the successful development of their properties. It is a significant fact that every newcomer to California on the irrigated projects in this district tributary to the Chico exposition, who has come to his new home with the money and intelligence and energy that are required for success anywhere, has done well here, and it is due to the development in an intensive way of thousands of acres of rich land that this exposition may hope for a bright future if the present management and enthusiasm continues as it has started.

At Chico is the plant of the Diamond Match Company, the shops and offices of the Northern Electric Company, the state normal school, Healds Business College and many other institutions of merit. The city bears the distinction of owning a natural park of 1920 acres extending from the city up into the foothills of the Sierras. This was the gift of General Bidwell who started the town and to whom the city is indebted for many other parks and trees that were planted many years ago.

In the cattle show Holsteins were shown by John H. Guill, Jr., and L. Herman of Chico; Angus by A. C. Stevens of Live Oak; Devons by Garner Brothers of Chico; Jerseys by S. F. Williams of Chico, C. E. Barrows of Los Molinos and J. Troxel of Chico; Shorthorns by H. L. Murphy of Perkins.

In the hog show there were some splendid Poland Chinas shown by J. S. Williams of Chico and a large herd of Duroc Jerseys exhibited by Rucker and Coppin of Fair Oaks.

The keenest competition of the live stock show developed in the Berkshire hog classes. With the great interest that is being manifested in this breed in northern California this Berkshire show promises to attract attention all-over the coast.

The first prize in the class for boars two years and over was awarded to Panama Lee, the boar at the head of the herd of C. E. Barrows, Los Molinos. He is a well finished hog of good length, has a deep body, short legs, a well sprung rib and a short head. T. W. Goethe of Perkins won first in the yearling boar class with a son of Royal Masterpiece. For boars over six months and under one year Barrows won on Panama Lee, 2d, a young boar recently brought out from the East, an animal with great substance and remarkable bone. Goethe was second with a very stylish, well made hog with lots of finish. There was keen competition on boar pigs under six months old. H. L. Murphy of Perkins won with a well grown pig with a good head and back and a long body. Barrows was a close second with a younger animal. Harvey Blodgett of Perkins was awarded first on aged sow.

There was considerable interest at the ringside when the yearling sows were judged. Murphy won with a very nice type, a sow that had a litter of pigs in the show and was in fine show condition herself. Her right to first honors was closely contested by a sow from the Barrows herd, another mother of a large litter, a good headed one and even all through, but not in the show condition of the Murphy entry. She was awarded second. The sensation of the show developed in the over six months and under year sow class in a daughter of Panama Lee shown by A. L. Stevenson of Los Molinos, weighing 285 pounds at a little over six months of age and carrying with her size a lot of quality and finish. She has a nice head, a splendid back, plenty of depth and is a fine example of what can be done with hogs on alfalfa, milk and grain in Northern California when they are bred right and fed right. Mr. Stevenson is one of the best hog feeders in the state. This sow was made first, Goethe had second with a beautiful daughter of Royal Masterpiece; while Murphy and Barrows had two fine animals just outside the money. On sow pigs Murphy won both first and second. Murphy won first on three sows and one boar under one year, Goethe second. For produce of sow Goethe was first, Murphy second. For get of sire Murphy was first, Barrows second, Goethe third. Panama Lee, owned by Barrows, was made champion boar of the show. Murphy's yearling sow was made champion female. Murphy was awarded first for the best herd, quality to count 50, numbers 50 per cent.

The live stock awards were made in a very satisfactory manner by Prof. Gordon H. True of the University of California. It was a very fortunate thing for California when Professor True consented to come to California to take charge of the animal husbandry department of the agricultural college, for he ranks with the very best live stock judges of the world and is not only thoroughly trained in all of the scientific things pertaining to animal industry, but is a practical common sense stockman who has bred, fed and exhibited winning stock at the leading shows and fairs. It is worth going a long way to see Professor True judge stock and hear his reasons for placing awards.

It is a pleasure for the Cultivator to record the success of this first exhibition and extend best wishes to the organization for a long life of continued usefulness.

The Orland Farm Bureau Picnic

The Cultivator's Special Representative Attends the Orland Farm Bureau Picnic and Gives an Interesting Account of the Gathering

THERE has been much of interest in agricultural circles in Northern California during the past week or so, and one of the most interesting events was the big picnic of the Orland branch of the Glenn County farm bureau.

Over a thousand people gathered on Saturday, May 9, at the Greenwood picnic grove on the bank of Stony Creek. There were games and other amusements for the little ones, a ball game for everybody, a big picnic dinner and addresses that were of interest and benefit to all.

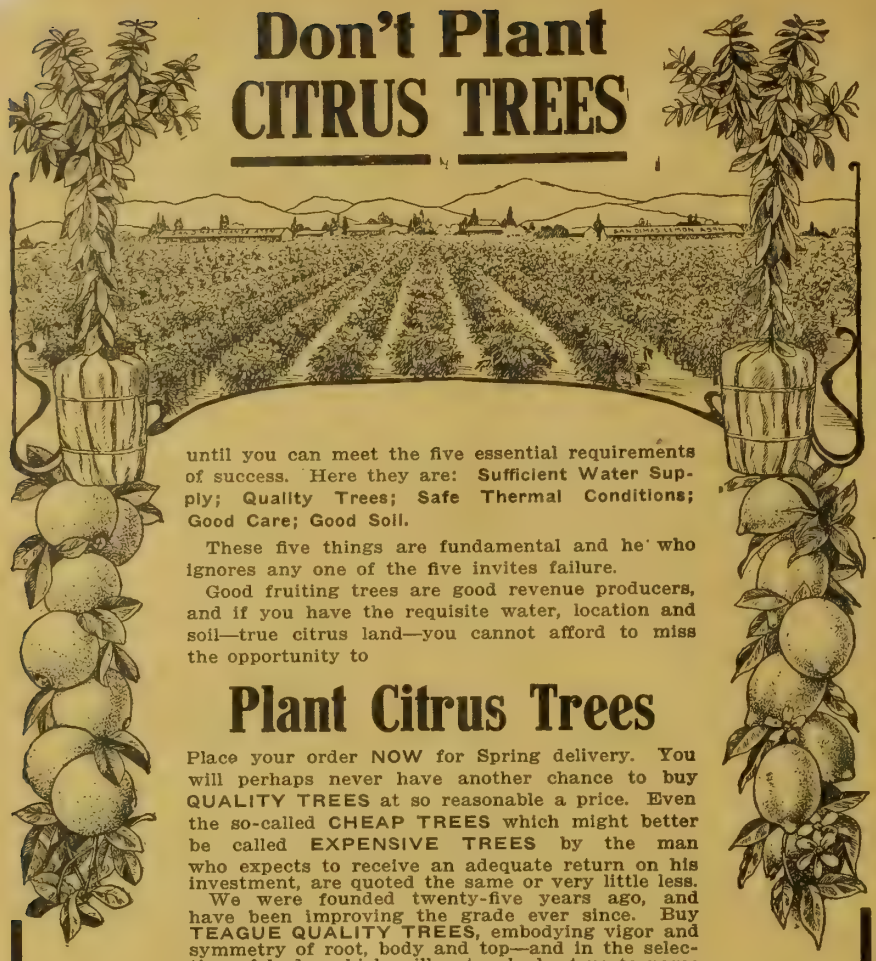
There is a great deal of interest in the farm bureau movement in Glenn County, and in his opening remarks Farm Adviser Hellemann urged every farmer in the county to try out the service that may be obtained by joining the bureau that is organized in his district and getting in touch with the United States department of agriculture and the California college of agriculture and experiment station. Every farmer belonging to any one of the branches of the bureau and paying his one dollar for dues can bring to the attention of the adviser any agricultural problem that may arise, and if he does not have the information necessary for its solution he calls in any expert advice that there may be available. If it is one of those unanswerable questions that beginners in farming can ask by the dozen the only thing that can be done is to frankly admit that some things are beyond the realm of possibilities. For instance there are settlers on many projects in all parts of California who have made small payments on a piece of land and have very little capital, one-tenth perhaps as much as they need for the proper buildings and equipment, and who have no experience in farming, who would like to have the farm adviser or someone else tell them how to get rich in a few months. But there are no quick, bonanza roads that lead to wealth in farming except in the story books and some advertising literature.

There was a proposal some time ago to hold a big May day picnic to be attended by all of the farmers of the county, but the lateness of the season and the difficulty of finding a suitable central location caused it to be postponed. Then the Orland people took up the idea and invited the farmers of the entire county, and the result was one of the most successful gatherings of the season.

Prof. G. H. True, chief of the animal husbandry department of the agricultural college of the University of California, delivered an address on dairying, a particularly timely subject in this district that is rapidly developing into one of the best dairy sections of the United States. Professor True called attention to the fact that while in this part of California it is possible to grow any kind of fruit suited to California conditions, that live stock and animal manures are essential to

(Continued on Page 655)

Don't Plant CITRUS TREES



until you can meet the five essential requirements of success. Here they are: **Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.**

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order **NOW** for Spring delivery. You will perhaps never have another chance to buy **QUALITY TREES** at so reasonable a price. Even the so-called **CHEAP TREES** which might better be called **EXPENSIVE TREES** by the man who expects to receive an adequate return on his investment, are quoted the same or very little less.

We were founded twenty-five years ago, and have been improving the grade ever since. Buy **TEAGUE QUALITY TREES,** embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the term, but true to the best type of the varieties to which they belong as well.

Write today for prices and particulars. No orders too large or too small to fill. All correspondence promptly answered.

Citrus and Tropical Fruits

"CITRUS FRUITS IN THE PHILIPPINES"

P. J. WESTER, horticulturist in charge of the Lamao experiment station, Philippine Islands, is the author of "Citrus Fruits in the Philippines," a department of agriculture publication. Mr. Wester gives a bit of history in his preliminary statement of the citrus conditions in the Philippines, with technical description of the different varieties cultivated there. From this section of his book we quote

"While the orange is nowhere planted in orchards it is fairly well distributed. Judging from the prevalence of the citrus fruits in the markets in the various parts of the archipelago it ranks fifth in production, as compared with the mandarin, pomelo, lime and calamondin, the only citrus fruits beside the orange that may claim to be of any economic importance even from a Philippine point of view. Excepting a few budded trees of recent importation or distribution by the bureau of agriculture all trees are seedlings and nearly always the fruit is poor in quality."

The author then gives items regarding the sour oranges which grow on the Island of Mindanao. The mandarin is confined to a small district around Santo Tomas and scattered trees are found in other parts of the archipelago. Mr. Wester also describes the tizon, a form of the mandarin but one which is extremely rare in cultivation. After giving botanical description of this fruit the writer says:

"The tizon is extremely rare and only a few trees are found in cultivation, confined to the citrus district of Batangas, Luzon. The trees are said to be quite prolific, and the fruit matures from September to December. This fruit, on account of its scarcity, is of no commercial importance. However, it would be an acceptable dessert or breakfast fruit, being a little more acid than the orange. It is said to be an introduction from Spain. The tizon is without doubt the C. papillaris described by Blanco in 'Flora Filipinas.'

"The tizon is believed to be a natural hybrid between the mandarin and the pomelo. It has inherited the loose-skinned character, large juice cells and partial absence of spines and leaf character of the first named species to which it is (without the writer having had the opportunity to examine the flowers) unquestionably more closely related than to any other species in the genus. The tizon is represented in the citrus collection at the Lamao experiment station under bureau of agriculture No. 744 and 745."

The pomelo is the most widely distributed species but with this fruit "the quality is wretchedly poor, dry and insipid with a very thick skin." A new variety, Citrus webberii, known popularly as the alsem, is spoken of as a shrubby tree with small, sharp spines, the surface of the fruit fairly smooth, greenish yellow to lemon yellow, skin thin, of the "kid glove" type, flesh whitish to grayish, very juicy and aromatic. Regarding this tree the author says:

"Plants of the alsem have never been seen by the writer in the provinces, the description of the plant having been made from budded plants growing at Lamao, propagated from material collected in Bulacan. The trees have a long flowering season, as fruits are offered in Manila through the summer to late in autumn. The variation in the fruit is very great, some being of little value while others are extremely thin skinned, well flavored, juicy, aromatic, with less rag than perhaps any citrus fruit that has been examined by the writer. The floral characters correspond closely to those of the mandarin, which the fruit in some forms also resembles in appearance and in its loose-skinned character. Flavor and aroma place the alsem in close relationship with the cabuyao, C. histrix, and it is a curious fact that the Tagalogs always call it 'cabuyao.' In common with the cabuyao it is frequently infested with the rind-borer, Prays citri, while the mandarin is practically immune to this pest."

"The alsem was considered a variety of the mandarin, but a closer study of the plant and fruit shows that it differs so greatly from all other Philippine species of the genus as to be entitled to specific rank, and it has been named in honor of Dr. H. J. Webber, director of the citrus experiment station, Riverside, California, association with whom, in connection with his citrus and pineapple breeding work, more than any other cause influenced the writer to take up the improvement of the tropical economic plants."

Another, Citrus webberii, var. Montana, popularly known as cabugao, is referred to as follows:

"Budwood and fruits of the cabugao were forwarded to the bureau of Mr. A. M. Burton from the Mountain province. The writer did not have the opportunity of examining the fruit, of which, however, an excellent photograph was made, and to date of writing the plants at Lamao not having bloomed there has been no chance to examine the floral characters. The general character of the plant and fruit indicates that the cabugao is a form of the alsem."

Regarding the talamisan, citrus longispina, we quote:

"The talamisan is exceedingly rare, and is found in cultivation in Bohol (one plant has been seen in Cebu) and is fairly productive. Excepting the mandarin, which is also of rare occurrence, it is much superior to all other citrus fruits grown in these two islands, and is eaten by the inhabitants; it is nevertheless very rare and of no economic importance at present. The fruit ripens in January and February, and is a poor keeper. Introduced into cultivation, the fruit of the talamisan could to advantage be used as an ade fruit, and with a little sugar it would make a good breakfast fruit. The dense growth of the plant, with numerous suckers, armed also with formidable spines, would make it a good live fence.

"The talamisan, or tamisan as it is also called, is one of the most interesting citrus fruits that has come to the attention of the writer. Its angular growth, formidable spines, broad, sometimes almost orbicular, distinct leaves and fruit easily distinguish the talamisan from all other species in the genus."

Many other varieties of the citrus are referred to. We will only refer to the Royal lemon, citrus excelsa, regarding which it is said:

"Plant material of the limon real has been collected in Tarlac, Bontoc and Bohol, and the fruit is at rare intervals offered for sale in small quantities in Manila.

"The name of the plant, 'Royal lemon,' indicates the esteem in which the fruit is held by the people, and while it is unfortunately true that most fruits tested have been too dry to be of any value, yet in the best types the fruits in quality and aroma surpass all lemons and limes that the writer has had the opportunity to sample. With its robust, thorny growth, large leaves and broad winged petioles and considering its affinity to the lime and lemon together with the roundish oblate fruit with 34 to 35 stamens as against the 20 to 26 in those species and with its 10 to 14 locules, this plant is apparently as distinct from the lemon and lime as these species are from each other.

"The horticulturist and plant breeder ever on the alert for new plant material that may enhance his profits, extend the cultivable area of his crop, or be used in making new cross combinations, will naturally ask himself of what value are these new plants and fruits. Briefly stated, it may be said that the tizon is a dessert or breakfast fruit of high, if not perhaps the highest, order, its main defect being

the unsightly basal projection. Then, as stated elsewhere, the best 'limon real' is unsurpassed in quality for 'ade' making. Perhaps third in importance are the better types of the alsem for the manufacture of citric acid, etc., and it might find a sale in competition with the lemon and lime, depending to a great extent upon its keeping qualities. The juicy, thin skinned and few-seeded talamisan may find lovers as a breakfast fruit and is also of the right size for an ade fruit. If cultivation would increase the juiciness of the panuban, this fruit may find favor with many. A good marmalade may be made of the calamondin. The above species or varieties have more or less of a future on account of their pomological merits, and the plant breeder, by crossing them and the cabuyao and canci with old cultivated species, might obtain valuable results."

From the series of remarkably fine plates in the bulletin we would judge that these fruits are all of very low grade as compared to products in this state. However, we doubt not the work of men like Mr. Wester will materially alter conditions of these fruits in the Philippines.

ORANGE MARMALADE

By H. D. Kingsbury in Redlands Facts.

Orange marmalade has been known for many years. It was first called by this name in honor of Mary, Queen of Scots, who when detained as a prisoner at Lochleven became ill. A Scotch confectioner made up a jam of oranges for her which she greatly relished, and the confection was therefore dedicated to her under the name of "Marie malade." Hence our word "marmalade."

Most of the marmalade is made from the bitter Seville oranges which are shipped to England and Scotland from Spain. From these oranges the marmalade derives its characteristic tartness. The California oranges make a sweeter marmalade which is considered better by many people.

Orange marmalade is a jam from oranges and sugar, in which almost the whole of the fruit is used. As the peels of the fruit, however, differ from the pulpy part in consistency, it is necessary to give a different treatment to these two parts of the fruit.

It is best to discard the white part of the peels because this contains a very bitter principle called hesperidin which affects the taste of the finished product. In order to make the peels tender and transparent a special treatment is necessary.

The household formula which follows will make a very good marmalade, and the proportion of the different ingredients can be increased to a commercial scale if desired.

Use ten pounds of oranges and two pounds of lemons. Peel all of this fruit with a sharp knife as thinly as possible, cutting off the colored, oil-cell layer of the peel, but not taking any more of the white part of the peel than is necessary. And one-half cup of salt to half a gallon of water, making a brine. Cover the thinly cut peel with this brine and set it away for 24 hours.

Remove the white rag of the peel from the fruit, then slice the fruit and boil it with its juice and just enough water to cover it, for ten minutes, and set it aside for 24 hours.

Next day drain and rinse the peels, cover them with water and boil until they are tender, changing the water twice. Then drain the water from them and cut into long thin strips with scissors or a sharp knife.

Weigh the pulp and its juice and the liquid it is in, and also weigh the drained peel. To the total weight of both pulp and peel thus found use an equal weight of granulated sugar. Add all of this sugar to the pulp and its liquid. Boil for 15 minutes, then add the drained peel and continue the boiling to a jelly. Pour into jars just taken from boiling water and immediately seal or cap with caps also just taken from boiling water, and set aside to cool.

Foreign competition on marmalade is strong. There have been long established plants in England and Scotland for the manufacture of marmalade which have supplied the world's market for many years. It is a difficult proposition to introduce a sweet marmalade on the market which is accustomed to the foreign standard of goods and flavor.

The cost of orange marmalade made from our California fruit includes the items of fruit, labor, fuel, sugar, jars, cases, freight and selling expense or brokerage.

When making the marmalade in considerable quantity for sale the cost items are as follows: Fruit, one-half cent per pound; labor, one-half cent per pound; fuel using crude oil, one-twentieth of a cent per pound; sugar, four cents per pound; glass jars and tops, including shipping cases, four and one-half cents per pound; freight, in car lots, one and three-quarters cents per pound; and selling expenses, eight-tenths of a cent per pound, thus making a total expense of a little over twelve cents per pound delivered in the East. This, however, is the cost on making large quantities, and therefore it will be somewhat higher when making smaller lots.

There are many variations of the above formula, as some add more lemon, some use a certain percentage of grapefruit, some use no lemons or grapefruit at all. Some use the entire fruit with the white part of the peels.

Orange peel does not become transparent nearly as readily as do both lemon peel and grapefruit peel, therefore to make a beautiful piece of goods all of the orange excepting the peel can be used, and instead of using the orange peel, substitute grapefruit peel treated in the same way, which becomes as transparent as glass.

The success of the dairy farmer depends to no slight extent upon the careful rearing of the calves. The careful dairyman sees in every heifer calf the possibility of a cow that will not only replace a discarded member of his herd but help to raise the average production.

YEAR BOOK

The Year Book of the United States Department of Agriculture for 1914 is being mailed. Copies may be had by subscribers of the Cultivator if they will write representatives of their districts in the United States Congress.

Of course the usual report of the secretary occupies the first part of the book. Following that are a number of papers by specialists in the service of the department. We note such topics as national forests and the farmer, organization of rural communities, clean water and how to get it on the farm, story of the thermometer, cooperative marketing, management of public roads, American farm women, selection of household equipment, farm wood-lot, and, of course, a mass of statistics.

I believe it is safe to say that the majority of the men who are attracted by the "back-to-the-land" movement belong to that class who have by economy laid by a modest sum. To this class of men the investment of a lifetime's savings becomes a vital question. To the man who has plenty of money it makes little difference as to the price of the land or the home that he wants.

Opening of

Leffingwell Heights **LEMON LAND**

Here's your opportunity to buy real choice Lemon Land, in the highly favored Whittier-La Habra citrus belt. This fine rich land adjoins the famous Leffingwell Grove, that in 1913—the year of the big freeze—yielded a lemon crop of over $500 net profit per acre. This was in 1913, the test that distinguished the real from the so-called Lemon Land.

You will remember that many so-called citrus sections had to quit that year. And that the Whittier-La Habra lemon and orange groves came out, wearing a beautiful bright green, in bold contrast to the general dull, dead brown of less favored sections.

Why take chances with far out, exposed lands, when you can get your choice of the cream of sheltered lemon lands at the opening price of $500 per acre (net acreage) with ample water, delivered to highest point on each tract.

Leffingwell Heights lies in a beautiful valley, sheltered against harsh winds, by the Puente Hills. Only 16 miles to Seventh and Broadway, the heart of Los Angeles, via Whittier Boulevard, Pacific Electric or main line Santa Fe Railway.

Here's YOUR opening to break away from your limited and uncertain income. Get five or ten acres of this choice land now at the opening price. Have it set to lemons, avocados or valencia oranges and get a good income for life.

Automobile excursions every morning at ten o'clock. Write, phone or call and make reservations.

"I always find just what I need at the lowest price in WHITING-MEAD'S BUILDING MATERIAL Catalog" You can do the same!

Don't Delay Send Coupon Today, and receive this Valuable Book FREE

Buy direct - - at rock-bottom prices - - and save 25% to 40% on every order of building material you place. Clip the coupon, fill it out and send it in TODAY. You will receive the big, comprehensive Whiting-Mead complete Building Material catalog by return mail. It is saving money for thousands of ranchers. Why not for you?

26 Guage Corrugated Iron $2.60 Per 100 sq. ft.

A big special purchase that's another proof of our great buying power, as this price is really less than ordinary wholesale cost.

26 guage, 95 lbs. to 100 sq. ft., best annealed sheet steel thoroughly coated with a specially prepared paint and for many uses, even more satisfactory than galvanized.

Place your orders for this early, as even the great quantity that we have secured will not last us for very long, and it will not be possible to get more to sell at this price until after the war.

Regular widths in 7 ft., 8 ft. and 8½ ft. lengths.

Galvanized Screen Wire—14 mesh, per square foot in full rolls, 2¼c; less than full rolls, 2½c.

Galvanized Conductor Pipe—3 in., 6c per foot in 10 ft. lengths; 4 in., 8c per foot in 10 ft. lengths.

Irrigation Pipe—of galvanized steel for surface use, made of 24 guage steel, 10 ft. lengths only. 4 in., per 100 ft., $14.40; 5 in., $18, and 6 in., $21.60.

These prices will give you some idea of the wonderful savings possible through ordering from us by mail. If you have not a copy of our wonderful 1915 Catalog of Building Materials, use the coupon and send for it NOW. Everything that you need for building, fencing, tools, piping, etc., at "lower prices."

TOOLS for All Uses

10 in., Victor Brace, 75c.
10 in., Stanley N. P. ball-bearing brace, $1.90.
Stanley Levels, 12 to 18 in., 50c.
26 in., Disston saws, $1.50 and $2.
Buck saws, blade 30x1¾ in., 75c.
Pruning shears, 50c; saws, 45c.
Fence pliers, 75c; will drive and draw staples, cut, splice, straighten and stretch wire, 10 in. size.
6 or 8 in., Stilson wrenches, 75c.
Spading forks, 75c.
Manure forks, $1.10; with 6, 13 inch oval tines.
Hay Forks with 4, 15 inch oval steel tines, $1.
Square point, long handle shovels, 75c.
Garden hoes, 6 in. blade, 60c.
Coes' knife handle monkey wrenches, 6 in. size, 50c.
Agricultural monkey wrenches, 6 in. size, 25c.
Expansion bits, ½ to 1½ inches, 75c.
Large steel measure squares, both sides, 35c.
4½ in., try squares, 20c.
Car soldering sets, complete, 40c.
12 oz. claw hammers, 25c

Builders Hardware

Inside door locks, nickel finish, 50c each; dull brass, antique copper, or sand blast, 45c.

Sliding door locks, with one bronze key, finished in dull brass, antique copper or sand blast, single, $1.40; double, $2.10.

Cupboard turns, cast brass, T handle, antique copper, dull brass, sand blast or nickel plated, each 40c.

Drop handle drawer pulls, same finishes as above, 20c each.

Flush sash lift, antique copper or dull brass, 7c; sand blast, 8c each.

Bungalow front door handles with plate and thumb latch but no lock, antique copper, dull brass or sand blast, $3.25, or complete with lock, $7.

Store door lock, very serviceable, cylinder lock, bolts and night latch with three bit keys, any of above finishes $5.75, complete with brass escutcheon.

French window locks, any of above finishes, $1.30 complete, a $1.50 value.

Genuine Yale night latches with three German silver keys, $1.50.

Pressed steel butterfly hinges, 10c pair, all finishes.

Pressed steel screen door hinges, japanned, 12c pair; antique copper or dull brass, 20c pair.

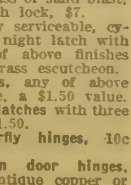
Standard House and Floor Paints, $1.50 per gal.

Standard makes of varnishes at 25% off regular prices.

Black Graphite Roof —per gal., 50c.

Standard Roof Paints— red, green, gray—per gal., 85c.

Shingle Stain, made from pure ground colors—per gal., 90c.



Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kalsomine, 4½c per lb.

Deciduous Fruits

CROP ESTIMATES

WITH all the other great things of 1915 California's deciduous fruit crop seems to be outdoing itself. In general we believe it will be close up to normal as to quantity, and the promise for quality is the very best. Marketing conditions are not so promising as we would wish, but the uncertain conditions are causing a general getting together, which will lead to more general cooperation than usual. Regarding almonds we have the following from

George W. Pierce, Yolo County

Complete data is not yet available. In some sections nuts are falling badly as a result of shot-hole fungus. It is also affecting the quality of the product. It would seem that about 3,000 tons may be anticipated.

* * * *

While not so closely connected with almond marketing as formerly, Mr. Dargitz is a large grower and shrewd observer. From him we have the following:

J. P. Dargitz, Sacramento County

In compliance with your request my opinion is that the 1915 almond crop from present appearances will be as good as any we have ever had in the state. That is about 3,200 tons. Some orchards are light, some are medium and some are heavy, and there are some young orchards which will begin to figure this year. Personally, I have seen very few orchards this year, but the above is from what I have seen and what I have heard from others.

* * * *

Mr. George P. Weldon, chief deputy of the state horticultural commission, following his usual custom, is sending out its summary. From this we gather:

The principal almond producing counties of the state are Butte, Contra Costa, San Joaquin, Solano, Stanislaus, Sutter and Yolo. Colusa, Los Angeles, Placer and Riverside each produces less than 5 per cent of the state's output. Contra Costa estimates 80 per cent of a normal crop; Sacramento, 85; San Joaquin, 75; Solano, 75; Stanislaus, 100; Sutter, 75, and Yolo, 80.

Santa Cruz County produces 53 per cent of the apples of our state. It reports present outlook as 70 per cent of a normal crop. Sonoma is the second largest county with 18 per cent; it reports 75 per cent of normal. Monterey is next in the state's production, with 9 per cent, and its estimate is 75 per cent of normal.

Apricots are a far more important crop. Santa Clara is our greatest producer, with 85 per cent of the state's total. The horticultural commissioner of that county reports conditions about 70 per cent of normal. Ventura County produces about eight per cent of the state's crop and its estimate is 75 per cent crop. Yolo's four per cent of the state's fruit will run about 70 per cent. Other counties producing about same quantity of fruit are Kings, Los Angeles, Orange, Riverside, San Benito, San Bernardino, San Joaquin and Santa Cruz. These all report from 75 to 100 per cent of a normal crop, excepting Orange, which reports a 25 per cent crop. Fresno produces about nine per cent of the state's output and reports condition at 85 per cent.

The cherries of the state are produced largely in Alameda and Santa Clara Counties, which produce almost one-half of the state's output. Placer, Sacramento, San Joaquin, Solano and Sonoma run from four to 18 per cent of the state's total. Conditions in these counties are as follows: Alameda, 60 per cent; Santa Clara, 40; Placer, 60; Sacramento, 90; San Joaquin, 100; Solano, 25; Sonoma, 25.

In figs practically every county reporting shows 100 per cent crop.

Citrus friuts are still dropping and it is impossible to give very definite estimates. So far as made the state commission reports approximately 100 per cent crop.

Also with olives, nearly every producing county reporting estimates full normal crop.

Fresno is our biggest peach producing county. More than one-third of the state's output comes from that one county. Its estimate is 75 per cent crop. Some of the smaller producing counties estimate as low as a 25 per cent crop. Other counties vary their figures from that up to 100 per cent.

Practically one-fourth of the state's pears are produced in Sacramento County. It reports production at 80 per cent of normal. Santa Clara and Sonoma Counties, also large producers, estimate respectively 60 and 75 per cent of normal; other counties generally running at about 75 per cent.

Table plums are produced principally in Placer, 75 per cent; Santa Clara and Solano, 80 per cent.

Two-thirds of the prunes of California are produced in the Santa Clara Valley. It reports 65 per cent condition. Sonoma, the next most important county, reports 60 per cent condition; other counties estimate 60 to 80 per cent.

More than two-thirds of the walnuts of the state are produced in Orange and Los Angeles Counties. The former reports 90 per cent condition; the latter, 105. Santa Barbara and Ventura Counties also have full crop; Ventura only sending in report, which is 110 per cent of normal.

* * * *

Regarding crop conditions Mr. Weldon adds:

The excessive rains and winds during the cherry season did a large amount of damage to this crop.

As was expected, the unfavorable climatic conditions resulted in the development of various fungous diseases, and peach leaf curl, pear and apple scab, apricot shot hole, walnut blight, brown rot of stone fruits and other kindred troubles are taking their toll of fruit. In a few localities, especially at high elevations, frost has played its part in damaging the apple and pear crop. While there are prospects for quite a heavy production of the various fruits in the main producing counties of the state, considerable of the deciduous fruit output will be of low grade, because of the attack of fungous diseases.

* * * *

In addition to report formerly given from Ventura County, County Horticultural Commissioner A. A. Brock writes regarding the present outlook:

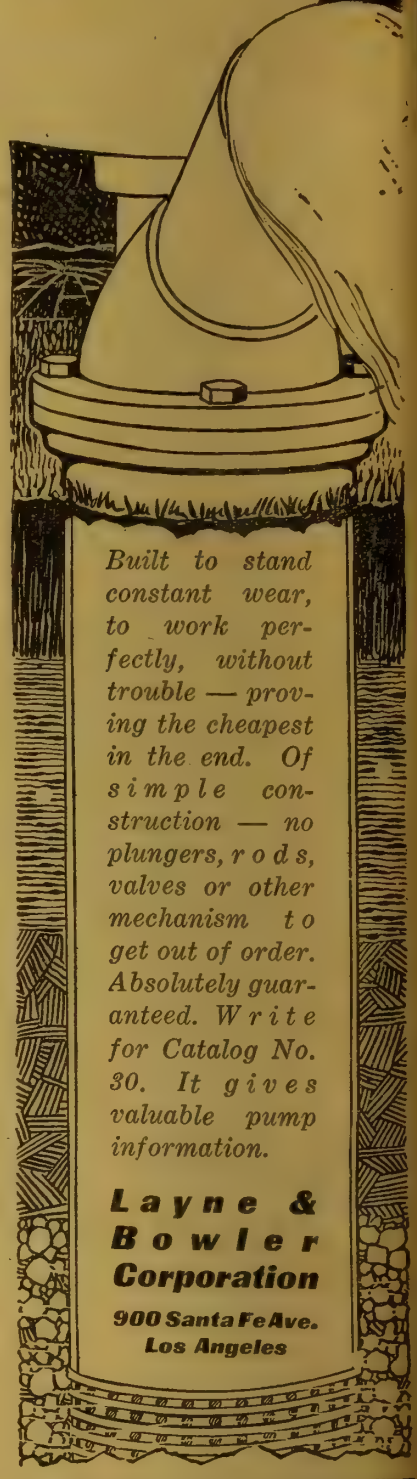
"Our apricots will be ready to harvest about July 4, and there is not over 75 per cent of a normal crop. The walnut crop promises a heavy production for 1915, about 110 per cent. Blight is doing considerable damage in some sections of the county at present. It is too early to make an estimate of the orange crop, as fruit is just setting, but the prospects look good in most of the orchards I have been in. Beets are in every stage of development from planting to harvest. There is a promise of about 110 per cent beet crop; olives about 100 per cent, and lemons about 100 per cent. Beans are being planted throughout the county. Almond rust and shothole fungus is doing considerable damage in the Bardsdale district to apricots. Some of the trees are almost defoliated.

Nearly all apricot growing sections are reporting freedom from frost injury. After the severe rains there were a few cold nights which caused considerable uneasiness, but so far as learned the injury was practically nil.

Our consul at Seville, Spain, reports that the olive trees of that section are in splendid condition, that abundant rain has put the ground in excellent shape, and that there is every prospect of a good olive crop in Andalusia next season.

Supervisors of Riverside County have formally put themselves on record as favoring appointment of a county farm adviser.

Layne & Bowler PUMP



Built to stand constant wear, to work perfectly, without trouble — proving the cheapest in the end. Of simple construction — no plungers, rods, valves or other mechanism to get out of order. Absolutely guaranteed. Write for Catalog No. 30. It gives valuable pump information.

CROWN GALL

In purchasing nursery stock, as well as in buying other commodities, the investor does well to go into the deal with his eyes open. From the standpoint of the horticulturist there are always certain things to be desired in young tres, but equally important is it that the stock shall be in perfect health and entirely free from disease.

Crown gall in any of its various forms is the one disease to be feared most not only because of its disastrous nature but because it is one which the unscrupulous nurseryman will attempt to pass off on the unsuspecting and inexperienced orchardist. In whatever form crown gall manifests itself, whether as hard gall, soft gall, or hairy root, it has been shown to be caused by a germ that lives in the soil and which enters the plant through wounds induced by poor grafting, careless cultivation and by borers, nematodes, etc.

In its ordinary form crown gall is characterized by the appearance of swellings or galls, small at first usually just below the ground line (crown) at or near the junction of the stock and scion; these may also occur on the small secondary roots. They may be either soft or hard galls; the former are smooth, soft spongy white or flesh-colored outgrowths which may reach a very appreciable size during one season and then be entirely decomposed and disappear by the following spring; the latter increase in size more slowly, persist year after year, harden and become rough and warty on the surface with age. Frequently the disease assumes a form known os "hairy root", characterized by the presence of bunches or tufts of closely matted rootlets with marked enlargements at their bases.

As the galls increase in size the function of the adjacent conducting tissue is interfered with, and the circulation is impaired as is shown by the poor growth and dwarfed appearance of affected trees.

The removal of the galls, a practice often indulged in by dishonest nurserymen, results in no permanent benefit. The thorough inspection of nursery stock and care in the cultivation of the orchards not to wound the crowns are important factors in the control of the trouble. Plant only on uninfected land and avoid heeling in healthy stock where the disease is known to be present in the soil.

Crown gall is an infectious disease and can be communicated from tree to tree and from one plant family to another. A partial list of the plants upon which it occurs naturally or upon which it has been produced by laboratory inoculation includes the daisy, tomato, potato, carnation, peach, rose, cabbage, grape, hop, sugar-beet, turnip, red beet, carrot, radish, chrysanthemum, oleander, marigold, pyrethrum, almond, clover, white poplar, Persian walnut, gray poplar, cotton, alfalfa, raspberry, geranium, apple, willow, quince, and tobacco.—Walter G. Sackett, Colorado Experiment Station.

THE ORLAND FARM BUREAU PICNIC.

(Continued from Page 651)

the maintenance of successful agriculture everywhere in the world and that there is no better way to establish a successful fruit proposition than to combine with it a herd of good cows. He explained the necessity of records and the great advantage of the cow testing association in which the cows of the members are tested regularly for the entire year. Any dairyman can test his cows, but testing is one of the things that is frequently left undone on a busy dairy farm, and year after year goes by without getting a definite line on the unprofitable cows in the herd. In the next year it is expected that several of these associations will be started in the upper Sacramento Valley. The importance of using good pure bred sires was impressed upon all dairymen and it was made very clear that an animal must be not only pure bred and registered, but also an individual of merit and with ancestors that have been good producers or he might be worse than a good grade. What is known as a pure bred scrub, or an animal that is a poor individual and with ancestors of no merit, is worse than a good grade because the pure bred scrub is more apt to transmit his bad points and qualities than is a good grade.

Professor True is a very forceful speaker and knows his subject thoroughly. His instruction was very much appreciated.

Hon. James Mills, the great citrus fruit and farming authority, made a very interesting and inspiring address, telling of the great opportunities along fruit and live stock lines here. Mr. Mills is developing a large live stock proposition in connection with the orchards at Maxwell and Hamilton and is the father of the farm adviser movement in Glenn County. He is doing a great work for the development of California agriculture, not only in the projects he is developing and through his official capacity as regent of the University of Califrnia, but in his unselfish endeavors to be of service in every uplift movement of every kind.

Since the department of agriculture began its first campaign work against the Texas fever tick in 1906, over 250,000 square miles have been totally freed from the ravages of the pest. This is an area greater than the combined states of Mississippi, Alabama, Georgia, Florida and South Carolina.

A pure milk and cream show will be held at the Panama-Pacic Exposition at San Francisco, June 14 to 20.

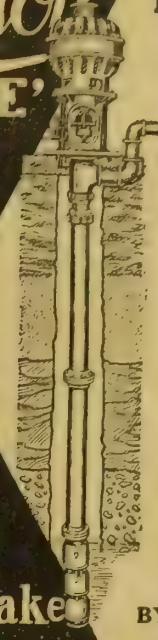
"Jackson MADE"

A Better Make Not Made

Write for Catalog No. 48 F



For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

The Lawn and Flower Garden

BEAUTIFY THE HIGHWAYS.

Written for California Cultivator
By Ernest Braunton.

IF proper requests are universally made and strenuously urged there is no reason why, during the next few years, all California may not be forested in both the cities and the countryside. The need for planting trees along country highways is great, for much of the southern end of California is dry and dusty and borders on desert conditions. If proper trees are planted along all highways, and made to grow, the greenness and shade will add much to the attractiveness of travel through the drier regions. Owing to the fact that some lands are under water and others are dry, the problem of proper trees and methods of planting is greater in the south than in the northern part of the state, necessitating a most careful study of soil, of available moisture, and methods of maintenance.

There is at present a large available fund of information on all these subjects. Trees have been planted and grown on desert areas. We already know of a large number of shade trees that will stand great drouth, having been carefully planted and cared for during their early years. Trees along county highways would naturally be planted at a greater distance apart than on streets, say 60 to 100 feet apart so as not to hide the scenery of mountain and orchard and sea vistas, and yet, looking down the highway, the effect would be about the same as that in a more closely planted city street. Again, the trees should never be planted so close that the road will not have the opportunity of drying out after heavy rains.

We cannot afford to allow these highways to go unbeautified. California is to be the playground of the world. Every dollar invested in making it more beautiful will be returned many times over by the tourists in years to come. It is said that the investment of $300,000,000 in carrying out the Baron Haussmann plans in the city of Paris was the best investment ever made by that city because it has attracted so many tourists who came to see the city beautiful. The cost of foresting California will be a small item compared with that of transforming a great city.

Iris and Gladiolus.

It is sure to come, the more extensive use of iris and gladiolus. The range of color in the iris is greater than in the gladiolus for more fine species grow wild than is the case in gladioli. The latter are garden hybrids, and compared with the best of the wild ones are nothing short of magnificent. Irises are not so much man-made for the reason that nature left less to do. They may be had in every gladiolus color except copper hues, and have the addition of blues and bronzes which we have not yet fixed in gladioli but which will soon come. Both flowers have been called the "poor man's orchid" and both should be extensively planted. They belong to the same plant family.

BREAD-FRUIT TREE—ARTOCARPUS INCISA

Gladiolus Primulinus.

This fine yellow is a wild species found a quarter of a century ago just below Victoria Falls in Central Africa. Crossed with common garden varieties it produces the loveliest tints in copper and sunset hues, the very shades of color the rose growers are striving for, but none have yet caught such coppers, salmons and salmon-pinks as may be found in these hybrid gladiolus. Last year I had about 800 of them flower and they were much admired by all who saw them. A writer in the June number of the Modern Gladiolus Grower states that "it transmits its color to all its seedlings," but such is not the case as I have half-bloods that are white, shell-pink like America and clear scarlet, also just plain red.

The Spanish Broom.

Just now the Spanish broom is in

full bloom and will be for some time as its flowers are in evidence over a greater part of the year than any other shrub we grow. Showers of gold is not too elaborate a term for these wonderful shrubs; but the botanist calls them Spartium junceum, though some nurserymen list them as Genista Hispanica. Whatever name they grow under they are noted for flowering more freely here than in their native Mediterranean region. They will endure as much drouth as any free-blooming shrub that grows and rests from production of bloom only about three months of each year.

Hybridizing Plants.

Every encouragement should be lent to those who will attempt the pleasurable task of hybridizing flowers. But much time and effort is wasted by amateurs who think any plants may be made to cross. No one would attempt to cross tomatoes with watermelons, yet crossing is often attempted with other plants somewhat less related than the two mentioned. Plants may only be crossed with those much like them in botanical affinity and many of these will not cross, yet there are rare cases of plants crossing that are not closely related. But the greatest success attends those efforts only that seek to produce crossses between two roses or two carnations, etc.

Read Garden Literature.

All who love plants should read what garden literature is available for aside from educational value there is a pleasure in reading of that of which we have even a slight knowledge. In his preface to the "Scot's Gard'ner," Lord Roseberry says: "What then I say is this, that we ignoramuses who know very little about it can derive a pure pleasure, not merely from the contemplation of gardens, but from the reading of books about them."

The Bread-fruit Tree.

It seems probable that the bread-fruit tree will grow in the very warmest parts of California though it is doubtful if the fruit would develop to an edible condition. Yet they thrive best in lands where the mango grows, and we have grown mangoes in California that are of some value. The bread-fruit, Artocarpus incisa, is sparingly cultivated in south Florida; eaten cooked as a vegetable rather than a fruit, it is widely used in the tropics.

GLADIOLUS

Notwithstanding the wonderful development which has been brought about in the gladiolus its culture is extremely simple, its tastes being quite similar to those of the potato. A light, sandy loam is the best soil. The corms may be planted at any time. They flower the same season and may be left in the ground. Cutting the flower spikes increases size of bulb, which requires four months to come to maturity. Gladioli are propagated by (1) natural division from the parent corm; (2) seed; (3) small corms growing at base of new corm.

JOHNNY WONDERED.

Johnny was putting some questions to his father on the subject of astronomy, in the course of which he asked if the moon was inhabited.

"Oh, yes," said the parent, "there are people living in the moon."

"Are there many?" queried the boy.

"Yes, lots," was the reply; "far more than in this world."

"Why, then," said the youth, "aren't they crowded a good deal at half moon?"

SCHMEISER WAY

Perhaps the most notable features of a California landscape are the eucalyptus trees. In riding over the great central valleys the horizon is marked on every side by these wonderfully beautiful and valuable trees. We think perhaps about the second item of importance is the Schmeiser derrick. Doubtless because many farmers have found that "The Schmeiser Way Makes the Farm Pay" these derrick towers are everywhere. The photograph on another page shows a couple of these money-savers in action on the world's largest haystack. Mr. Schmeiser says that one of them does the work of 12 men, nor is its use confined to the handling of hay alone, for it has proved valuable in many other lines of farm work. Best information may be had by writing Mr. Schmeiser at Davis, the home town of our University Farm.

Farm Bureaus

Maricopa County, Arizona, Jas. A. Armstrong, Adviser, Phoenix

Liberty, June 7. The demonstration showing the methods of grasshopper control on a commercial scale. The grasshoppers are just hatching in this district. The demonstration will be held upon the ranch of Mr. G. M. Knight. All ranchers who are interested are especially urged to be present.

Southside Farm Improvement Association, Roosevelt district, June 8. The general subject of the meeting will be poultry. It is expected that a representation from Mesa in connection with the Midsummer Fair will be present to secure the support of the ranchers on the Southside. Mr. M. E. Bemis, editor of the Southwestern Stockman-Farmer, has promised to take part in the program. Farm Adviser Armstrong will tell some of the advantages of raising turkeys in the Salt River Valley.

Mesa, June 9. Meeting called for the purpose of securing a proper backing for the Maricopa County Midsummer Fair.

Lehigh Farm Improvement Association. Regular meeting June 10.

Meeting Gilbert Commercial and Country Club, at Gilbert, June 11.

Mesa, June 15. Meeting of the committee in charge of the Midsummer Fair at Mesa.

Wickenburg, June 16. A meeting is being called to organize a local branch of the Farm Improvement Association of Arizona.

Meeting of the Higley Commercial Club, June 19.

Chandler Farmers' Union has its regular meeting June 24. On May 22 it was decided to hold one open meeting each month, to be held on the Tuesday preceding the last Saturday of the month, in order to cooperate with the extension service of the University of Arizona.

Meeting of the committee in charge of the Maricopa County Midsummer Fair at Mesa, June 29.

Sour Clover Seed Finds Market—Sour clover seed is wanted in California in carload lots, according to letters received by Farm Adviser Armstrong. Orchardists are planting this plant in their orange and lemon groves for a green manure crop.

Sour clover seed as it comes on the California market is in two grades—1st, that which is especially grown for seed, and, 2nd, that which is obtained as a by-product from threshing machines and recleaning of wheat and barley. The first of these has a germination test of about 95 per cent and retails to orchard men at 14 to 16 cents. The second grade has a low germination of 25 to 50 per cent and retails for about 4½ cents. The trade prefers the better grade, but there is also a ready market for the poorer grade provided it is properly recleaned.

If you have any of this seed or expect to have any when you thresh, please write to the Farm Adviser, Water Users Building, Phoenix, Arizona, stating the amount you will have, so that he can advise his correspondent if Arizona can supply the demand.

You may expect to get about $1.50 or $2.00 per hundred, f. o. b. cars.

Farm Adviser Will Poison Grasshoppers—How to poison grasshoppers will be demonstrated by Dr. A. W. Morrill, state entomologist, and Farm Adviser James A. Armstrong on the ranch of J. H. Knight, Liberty, Arizona, Monday, June 7. According to Mr. Knight grasshoppers destroyed $1500 worth of alfalfa seed for him last year. They are now hatching in great numbers, but this time a fight will be made, using the methods of control found successful in Kansas and California. The demonstration will include mixing and applying the poison on a commercial scale. All interested ranchers are especially urged to be present, Monday afternoon.

Vineyardists of Sutter County are busy sulphuring their vines to prevent mildew. Some are now making a third application.

The Yuba Ball Tread Tractor cuts the time and cost of getting to market.

It takes up but little more road space than a two-horse team, yet has the power of twelve or of eighteen horses — real live animals with head down and shoulder straining against the collar.

No matter what condition the roads may be in or how steep the grades may be, it never stops to rest. No balking — no shying — no shirking with it. It is easier to control than one horse.

THE YUBA BALL TREAD TRACTOR

Rough rutty roads will not damage the machine nor will the machine damage an asphalt-paved street. Its rugged, powerful construction and the low pressure per square inch on the bearing area of the treads prevent this.

The cost of this form of hauling power as compared with horses is surprisingly low. It helps solve the labor problem, too.

There is a booklet telling more about it.

CORN SMUT

Written for the California Cultivator
By Sacramento Valley Contributor

SMUTTED ears and stalks of Indian corn have been reported as causing sickness and loss among horses turned out to help clean up the roughage left after the corn pickers.

Just how the smut causes the disease does not seem to be known and veterinarians call it fodder or forage disease—for want of a better name.

The remedy suggested is one of prevention and elimination, either to keep the horses and mules away from the stalk fields or to feed them bran mashes frequently to keep the bowels well opened.

Corn smut is caused by spores which live over winter in the ground and sometime during the growing season find their way to the joints or forming ears of the corn plant. After finding a lodgement they multiply rapidly, so that an ear may be entirely replaced by a huge mass of black bunches containing millions of black dust like spores which are seed for another crop of smut. These bunches of smut are frequently larger than a normal ear of corn would be; sometimes a part of the ear develops normally and the balance is smutted.

Treating seed corn with formaldehyde, as grain is treated, does not prevent corn smut because even if there were spores on the kernels there would doubtless be millions more in the soil of the corn field.

The smut travels in the wind, and in districts where corn is grown it seems that practically all of the soil is infected.

There were fields in the Sacramento Valley last year that had lots of smut in the corn, where the land had not been in any crop for several years.

Smut is a worse pest some years than others—for reasons not well known. Corn planted early in June had less than that planted late in the month.

Corn smut prevention is one of the many unsolved problems for our agricultural scientists to work on.

FOREST FIRE PROTECTION EXHIBIT

With the approach of the forest fire season in the West, the fire protection exhibit of the United States forest service at the Panama-Pacific is arousing renewed interest. The display graphically shows in detail the measures being taken by the government to insure the early detection and efficient fighting of forest fires. This is the most important portion of the entire forest service exhibit.

In the center of the space is a large model, measuring 12 x 15 feet, showing a ranger district on a national forest. A lookout house and a lookout tower occupy the two highest peaks. These are connected by telephone with a ranger station which in turn is connected by telephone with various users of the forest at a ranch house, a hotel and a powerhouse. The model shows government roads, trails and bridges, constructed primarily for the purpose of making every part of the forest accessible to fire-fighters. Fire-fighting equipment boxes are placed at strategic points along trails and roads, and a fire line kept clear of inflammable material runs along one of the mountain ridges.

To one side of the large center model a full size fire lookout house, fully equipped for discovering and locating forest fires, is built on an imitation of a great boulder on a mountain top. The house is painted white to serve as a conspicuous target for heliograph messages directed toward it by patrolmen. The building contains binoculars through which a distant forest fire is seen; a fire-finder, by the aid of which the supervisor's office can be informed definitely of the location of a fire: and a special type of telephone in communication with the supervisor's office. There are also on display in the tower a portable telephone and a portable heliograph outfit for use by patrolmen. A pair of stereopticon machines are concealed within the imitation rock on which the house rests and throw pictures and descriptions on screens built into the rock, which tell the entire story of the fire protection work.

On a redwood tree trunk in another part of the exhibit is displayed a weatherproof iron box telephone, such as is placed along patrol routes on the forests. This telephone is connected with the telephone in the lookout and with a supervisor's telephone at the desk of the demonstrator by slack lines attached to tree trunks on swinging insulators, just as the line is installed on a national forest. This manner of construction enables the line to stand the stress of the elements through the winter and prevents the wire being broken when a tree falls.

The latest type of fire-fighting tool box, equipped with shovels, rakes, hoes, axes, canvas waterbags and buckets, canteens, lanterns for fighting fires at night, torches for setting back fires, nesting cooking utensils, and emergency rations, occupies a place near the lookout house.

Beside the desk of the demonstrator, who plays the part of the national forest supervisor, is hung a master fire map of a forest, similar to the one in the lookout house. On this map is shown the location of every trail, bridge, road, telephone line, telephone station, ranger station, fire-fighting toolbox and lookout station. At the locations of the lookout points are protectors oriented to correspond with the protractors at those stations. This map enables the supervisor to locate a fire directly from the reports of the lookouts without any mathematical calculations, and to place to the best possible advantage the force of men available for fire fighting.

Fire warning posters and rules concerning care with fire in the forests are posted upon tree trunks and in other conspicuous places through the exhibit as they are in the forests.

GROWING BEET SEED

The production of first-class beet seed in certain localities of the United States is far beyond the experimental stage; and the fact has been fully established that seed can be produced equalling, if not surpassing, in yield and quality any such product of Europe from which country the American beet sugar industry obtains practically its entire supply.

Immediately after the seed panic of 1911-1912, upon my return from Russia I engaged in cooperation with the Utah-Idaho Sugar Company in the production of pedigreed beet seed raised from imported mother seed. From the standpoints of seed quality and the resulting yield to the beet grower the undertaking has been entirely successful. Our seed has produced very good tonnage and beets high in sugar as recorded by various sugar companies. If it were not for the high cost of production, which is the one serious obstacle to growing seed in competition with Europe, the industry would be conducted on a much larger scale, as the quality of the seed assures a ready sale in the beet growing sections of the country. Since hand labor plays an important part in production the difficulties of successful competition become impressive when it is known that in Europe the average wages for men vary from 50 cents to 20 cents per day, according to localities, being highest in Germany and lowest in Russia, and where women, who are largely employed in the industry, earn from 35 cents to 15

cents per day. In our operations here we pay on an average $2 per day for nine hours' work, and have been called upon to pay as high as $3.50 when weather conditions compelled us to work under pressure.

Where we operate on leased lands we are at a disadvantage of from $8 to $10 per acre rental in excess of the standard of Austria or Russia. These items materially affect the cost of production.

In order to produce pedigreed seed whose inherited qualities are passed on to the next generation without deterioration, it is essential that we use only genuine mother seed. The use of ordinary commercial seed for propagation would result in failure. The cost of mother seed to us is $5 per pound, which is nominal considering the expense incurred in the scientific breeding and selection for its satisfactory production. These involve years of work, a large investment for equipment and the employment of special talent adapted to and highly experienced in this special work. So far it has seemed unwise, because of fear of the lack of stability and permanency in the beet sugar industry itself, to enter into this branch of the commercial seed industry in this country. The beet sugar manufacturers of America naturally have not felt justified in supporting an industry whose product must be purchased at an increased price over the same commodity imported from Europe. Notwithstanding the seed panic of 1911, which forced many American manufacturers to purchase large quantities of seed abroad at exorbitant prices, had it not been for the recent disturbances in Europe little attention would have been directed to our home enterprise.—W. K. Winterhalter in "Facts About Sugar."

INJURIOUS AND BENEFICIAL INSECTS

"Injurious and Beneficial Insects of California," second edition, by E. O. Essig, published by the state horticultural commission.

This is by far the most valuable addition yet made to the economic entomology of California. The first edition of this work was issued as Nos. 1 and 2, Vol. II, of the Monthly Bulletin of the state commission of horticulture. That edition was so soon exhausted that Mr. Essig at once began working on a revision. When he was transferred to the staff of the state University from the state horticultural commission it was with the understanding that he be permitted to finish his work of revision. The work is now being mailed by the horticultural commission, and without question the revised edition will soon be exhausted. The book has over 550 pages and is filled with hundreds of engravings and valuable text on insects, both injurious and beneficial, affecting California agriculture.

The arrangement is systematic, following the classification of insects rather than of host plants so commonly used in recent works of economic entomology. This was done with the desire of making it possible for the reader to acquire a more comprehensive knowledge of the relationships of insects, which forms the basis of all real intelligent methods of control. The host plant index in the front permits one to readily follow out the host plant arrangement if so desired.

The work is intended primarily for fruit growers and farmers and technicalities are avoided wherever not absolutely necessary, but it is hoped that entomologists may find it of some value also.

The index appears to be very complete and gives both the scientific and popular name of various insects.

BETTER CORN

Mr. W. W. Murray of San Diego County writes that he has been breeding up Oregon Evergreen corn for three years and now has a patch which runs uniformly from three to seven ears to the stalk. If our farmers will give more attention to this matter of breeding all of their seed they will produce more with less effort and on a smaller quantity of land.

"What a shame to waste so much land on that pig pen when you might turn it into a beautiful lawn!" exclaimed Mrs. Champa. "Nay," replied Mr. Littleton, "the pen is mighter than the sward!"

GAS ENGINE DONT'S

In order to assist the user in preventing most of the common gasoline engine troubles it might be well first to list a number of things that should not be done.

Don't put gasoline into the tank without straining it through a chamois; there may be water in the gasoline or some sediment that would clog up the carburetor or mixing valve.

Don't handle gasoline by the light of a lantern or other open light. If you have no electric light where the tank is located, never fill it except by daylight.

Don't attempt to run an engine without providing sufficient lubrication.

Don't over-oil the engine. Just enough in the right place is better than a quart.

Don't use common black oil on small bearings. Such oil is not suited to the purpose.

Don't get oil or grease on the wires of the battery circuit; it will ruin the insulation.

Don't hold a spark plug wire more than one-quarter inch away from the engine with the current turned on, when testing. There is danger of ruining the spark coil.

Don't throw away a spark plug unless it is broken. A spark plug does not wear out, and the only attention it requires is usually nothing more than grinding.

Don't screw a spark plug on too tight. It may "bake" fast. Graphite, if available, should be used on the threads.

Don't throw away any batteries in winter until you have tried thawing them out. Often they are only congealed or frozen up.

Don't leave the battery switch closed when the engine is not running.

Don't leave the gasoline turned on when the engine is not running.

Don't attempt to connect more cells of battery in a set than recommended by the maker of the engine. You may overload the spark coil and burn it out.

Don't leave strands of wire sticking out around connections. They may cause a "ground" in the circuit.

Don't attempt to use any method to warm up a carburetor in cold weather that might ignite the gasoline. Cloths that have been wrung out of hot water are the safest means of heating the carburetor if necessary.

Although the gasoline engine is as nearly "foolproof" as it is possible to make such a modern piece of mechanism, nevertheless troubles arise that are often difficult to locate and sometimes equally difficult to remedy.—Successful Farming.

THE ALFALFA WEEVIL.

This insect which has done such frightful damage in neighboring states and which will probably always menace California is now in three states of the country and is spreading. We are making every effort to keep it from the alfalfa fields of our state. So far we believe we have succeeded. Aside from placing a quarantine against the infested districts we have made annually a thorough inspection along the Salt Lake route leading from the areas infested. The inspection for 1915 has just been completed, and we rejoice to state that no trace of the work of this weevil was discovered. Of course this annual search will continue, and should the pest be discovered at any time in the alfalfa fields we shall at once adopt very drastic measures to eradicate it before it is dispersed, after which it would be well-nigh impossible to cope with it.—A. J. Cook, State Commissioner of Horticulture.

$5,450 Per Day Spent To Fortify Goodyear Tires

The other day we cited our experts to certain well-known tires. And we asked, What could Goodyear save by building tires like these?

$1,635,000 a Year

The answer was, "Based on current production, our saving would be $1,635,000 per year." That means $5,450 per day.

But that saving would probably cost our users a million dollars monthly. And the cost to Goodyear soon would be the rulership of Tiredom.

One Must Choose

Here's the choice that confronts us day after day: Shall we skimp Goodyear tires in ways that can't be seen, and increase our profit $1,635,000 a year? Or shall we pay that price to give our users a better tire than others?

Our answer is this:

Goodyear Fortified tires, for many years, have embodied five costly, exclusive features. These are five great protections found in no other tire.

We spend on experts $100,000 yearly to find new betterments to add.

In the past year alone we have added improvements which cost us exceeding $500,000 a year.

Those are the facts; believe them. We never exaggerate, never misrepresent.

Price Reductions

Now note another side.

Despite this ceaseless improvement, Goodyear prices are constantly coming down. Our last big reduction—on February 1st—made three in two years, totaling 45 per cent.

Yet not a feature is missing, not an item is skimped. And this year we are spending a half-million dollars on newly-adopted betterments.

That's one result of our mammoth output, our new equipment and our modern methods.

When we spend such sums to build tires better than rivals, don't you think it worth while to get Goodyears?

Most men do. Goodyear tires are selling now much faster than we can build them. Any dealer will supply you.

THE GOODYEAR TIRE & RUBBER COMPANY, Akron, Ohio
Makers of Goodyear "Tire Saver" Accessories; also Goodyear "Wing" Carriage Tires and other Types

GOODYEAR
AKRON, OHIO
Fortified Tires

Fortified Against
- Rim-Cuts—by our No-Rim-Cut feature.
- Blowouts—by our "On-Air" cure.
- Loose Treads—by many rubber rivets.
- Insecurity—by 126 braided piano wires.
- Punctures and Skidding—by our double-thick All-Weather tread.

Established 1888. Twenty-seventh Year.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

GROWING MEDICINAL PLANTS

The war in Europe is attracting attention to America's opportunity and to the necessity of producing and manufacturing many things which in the past we have depended upon other countries to supply us. Amongst these may be mentioned medicinal plants. Certain manufacturers are sending out lists of these plants which might well be grown in this country, and we doubt not the department of agriculture will mail information as to their culture. A warning is due, however, and in fact has been given by the department, that this field of agricultural endeavor will bear fullest investigation before it is entered upon. So while our producers may well look into the matter, large planting should be deferred until the market is secured. Most of these products have been grown where labor is cheap. True, those conditions may not return for some years after the close of the war, but if the war ends soon—as we all hope it will—it is to be presumed that the old trade channels will again be opened.

FOREST FIRES

The time for taking care of one of California's greatest heritages has arrived. Perhaps more than any other state California's watersheds are of value and we do not believe any other state has been so careless in caring for them. But during the past few years there has been a change and a most healthy sentiment is being created which looks toward more careful protection of the forests and all growth on the mountainside. Our rainless summers call for exceptional care. The forest service is sending out a series of ten "Don'ts" to campers and others who have occasion to visit the reserves. We simply refer to these:

Don't be careless with matches.

Don't drop cigarettes.

Don't knock out pipe ashes.

Don't build camp fires larger than necessary.

Build fires only on bare soil; never against a log.

Never leave fire until entirely out.

Don't burn brush where there is danger of spreading.

Don't be any more careless in the mountains than at home.

Don't be idle if a fire does occur.

Don't forget.

CONTINUE ROAD IMPROVING

From a circular sent out by the American Automobile Association we note that the New England states are making especially strong efforts to improve automobile highways in order to secure as large a proportion as possible of the summer travel of the Eastern autoists. The campaign is made at this time because of the cessation of travel to Europe necessitating some outlet for the pleasure seekers, and New England wishes to get its share of their spending money.

This is not a hint to California, for California has been acting on this principle for many years and is now reaping the benefits. However, there is still opportunity for greater improvement, and the appropriation of the recent legislature and the proposal to make another large bond issue all tend to more effective work along this lin. There is a limit to our expenditures, within economic bounds, still good roads will yield wonderful returns because of the number of people who are attracted by them. No other section of the world can surpass us in opportunity of putting roads through magnificent scenery. When once it is understood the world over that we have met the requirements of the autoists we will become more than ever the playground of the world.

Incidentally we may add that this all tends to greatly improve all farming lands and bring profit to the farmer. The great factor in production cost is getting produce to market. These costs are reduced every time good roads are extended.

PRACTICAL EDUCATION

For the past three years the graduating members of Prof. J. Eliot Coit's class in citriculture have finished their work in the college of agriculture at Berkeley by a trip through the citrus sections of California. The trip was begun on the western side of the Sacramento valley, following around to the eastern side and on down through the citrus producing section of Tulare County, then on to the extreme southern portion of Southern California's orange and lemon groves. Each year the members of the class have visited the offices of the California Cultivator. The members of the 1915 class are now just finishing their trip, spending this week in Los Angeles and the early part of next week in Ventura County's lemon groves. The class is in charge of Instructor I. J. Condit. They will give, as they have heretofore, to Cultivator readers their impressions, or one lesson rather, which they have learned during this trip.

The members of the class were frank in saying that they had seen some things which made citrus growing look somewhat discouraging to them. Doubtless other classes making similar investigations, whether in the fruit growing industry, general farming or live stock, would have found the same lesson. There is no calling but has its objectionable features, and young men with eyes wide open have seen some of these along with the good ones. We are reminded of a cartoon we recently saw which showed a bunch of graduates, diplomas in hand, marching forth from the portals of education. Strewn on the path before them are occasional roses and many thickly scattered tacks. The World stands at the other end of the path with suspended club, ejaculating, "Well!" There are few of our young people who will make their way along life's pathway without treading on many of the tacks, but these seem to be necessary to bring out the true manhood and womanhood in us all.

SIDE LIGHT ON THE WAR

The financial loss from the present war, its cruelty and loss of life, have been dwelt upon until the world is almost hardened. As one woman has remarked, "What is the loss of a half a million men? No one can appreciate nor understand. To a woman the loss of one life means more than any vast array of figures." Likewise a sidelight on some of the sorrow and discomfort of army life is given in a postcard which we have just seen. This was sent, presumably from the trenches in Belgium, by a boy in his teens to his mother in England. We say "presumably in Belgium," for there is no mark on the card by which the whereabouts of the boy can be known. Its postmark is simply "Field Postoffice." The soldiers are permitted to write nothing whatever upon this card. Their only privilege is to erase such portions of the printed form as they wish. Any other word, even an expression of love, calls for its destruction. But here is the full form of the message which we imagine would cause any mother's heart to yearn for a few words from her boy. The address side of the card also has warning that only the address is to be written:

NOTHING is to be written on this side except the date and signature of the sender. Sentences not required may be erased. If anything else is added the postcard will be destroyed.
I am quite well.
I have been admitted into hospital.
(Sick and am going on well.)
(Wounded and hope to be discharged soon.)
I am being sent down to the base.
I have received your
(letter) dated .....).
(telegram).
(parcel).
Letter follows at first opportunity.
I have received no letter from you
(lately).
(for a long time).
Signature only .....
Date.....
(Postage must be prepaid on any letter or postcard addressed to the sender of this card.)

In this case all the above was erased except "I am quite well," "I have received your letter dated (April 22)," "Letter follows at first opportunity," also signature, "A. E. Atkinson."

Dairymen of Eastern Multnomah County, Oregon, have formed a cow testing association.

Agricultural Notes

The citrus fruit trade of South Africa has greatly increased this past season.

The king of Sweden has signed a new constitution, one feature of which is the granting of the suffrage to men and women over 25.

The sixth annual meeting of the American Farm Management Association will be held in Berkeley, California, August 9 and 10.

The United States department of agriculture has been experimenting with a method of concentrating grape juice by freezing and centrifugalizing.

The Russian government has prohibited until further notice the shipment through the port of Archangel of goods intended for private consignees.

San Diego to Nw York in 11 days and seven hours was the record of E. G. Baker, recently made in an auto from the Panama-California Exposition to our biggest city.

Bermuda grass is regarded as the most valuable pasture grass in the South, but when it occurs in fields of cotton or other cultivated crops it is proving very difficult to control.

Fruit growers of Australia are asking what will become of their next season's crop if the war continues. The only solution seems to be the establishment of canneries and dry yards.

The department of commerce is about to appoint a special agent to investigate markets for American fruit in Latin-American countries. A civil service examination of applicants for this position was held April 1.

Each year thousands of bushels of strawberries go to waste because of low prices or some adverse condition. The department of agriculture has therefore prepared bulletins on the manufacture of berry by-products, which should help in saving this waste.

Comparing imports and exports of the United States during the ten months ending with April, imports have fallen from $1,572,114,692 in 1914 to $1,374,189,749 in 1915, a decrease of $197,924,943, or 12.6 per cent, while exports have risen from $2,045,774,485 to $2,225,548,068 an increase of $179,773,583, or 8.8 per cent.

Everybody knows that birds when they migrate in the fall generally "go South," but knowledge is seldom more specific. A new department bulletin brings out the fact that while some birds go to Florida or the West Indies or Mexico, others, such as the bobolink and ricebird, go as far south as Paraguay and the southern part of Brazil.

The dairy division of the department of agriculture supervises the manufacture of 500,000 to 900,000 pounds of butter each year for the navy. According to specifications prepared by this division, this butter is made from pasteurized sweet cream and packed both in hermetically sealed cans holding five pounds each and in tubs holding 60 pounds each.

The completion of the Celilo canal on the Oregon side of the Columbia river adds Idaho to the list of states having a seaport. "Through the operation of this canal," writes Fred W. Vincent in the Scientific American, "vessels of the river stern-wheel type can now pass from the Pacific ocean to Lewiston, head of navigation on the Snake river, the principal upper tributary of the Columbia, a distance of 480 miles." The canal was formally opened to traffic on May 5.

Agricultural News Notes of the Pacific Coast

Northern California

The Napa County farm bureau will hold a celebration on September 15.

The Sacramento Valley is already marketing its Red Astrachan apples.

An unusually heavy acreage is being planted to beans in the vicinity of Orland, Glenn County.

The Codora Farm bureau in Glenn County is planning a monster farm picnic for the fourth of July.

More than 125 blooded rabbits were exhibited at the Butte County spring exposition at Chico last week.

The strawberry crop of Placer County has been damaged from 50 to 75 per cent by the early rains.

Hop growers fear that even with the small acreage planted this year prices are going to be below normal.

Eleven hundred head of cattle were shipped from Cottonwood, Shasta County, last week. The cattle filled 50 freight cars.

A number of farms and some live stock were destroyed by a river of mud sent out by Mt. Lassen in its recent big eruption.

Orangevale, Sacramento County, reports a good crop of prunes in prospect; oranges, olives and almonds also promise good yields.

No sales of the spring clip of wool are yet reported in Sonoma and Mendocino Counties. The prices offered are around 20 cents.

The second crop of alfalfa has been cut at Orland, Glenn County, and the prospects for good crops of all kinds of fruit are very bright.

The first carload of watermelons received in San Francisco met with rather a cool reception as the melons were too green to be attractive.

Yolo County is making a fight on thistles. Horticultural Commissioner Hecke has been going over the county inspecting the thistle campaign.

The warm weather of the past few days has caused a marvelous growth in the rice fields. The old crop rice is practically sold out and it is thought the new crop will come into practically a clean market and bring good prices.

H. S. Smith, superintendent of the state insectary, has been inspecting apricot orchards of Tehama County in company with County Horticultural Commissioner Weeks. He found but few orchards infected and reports presence of the scale parasite in all of the orchards.

The state reclamation board held a session at Willows the latter part of May to listen to protests of farmers who object to paying assessments on the state constructed levees to control the Sacramento. No agreement was reached and it is thought the farmers will carry their protest to the court.

Much interest is manifested in English walnuts in the Sacramento Valley this season and considerable planting is being done. In spite of a somewhat cold, backward season the crop is developing very satisfactorily. The Guilford farm at Orland reports trees heavily loaded and the crop maturing fully two weeks in advance of last year.

Central California

Orosi, Tulare County, is shipping early tomatoes.

April 30, 1916, has already been named as the next raisin day.

A $3,000,000 good roads bond issue is being talked up for Fresno County.

Porterville expects to clean up its Valencia crop within the next week or two.

Rice is going to be tried out in the Traver district of Tulare County this year.

Packing of apricots started at Sultana, Tulare County, the first day of June.

The Kerman Cured Fruit Association has disposed of its 1914 crop of dried peaches.

Peach growers of the Hanford section of Kings County have formed a marketing association.

Kerman's alfalfa meal mill will open as soon as the second crop hay is dry enough to grind.

Citrus growers of Lindsay are giving whole-hearted support to the fight against gray scale.

Fresno's raisin day made a net profit of almost $2,000, according to report filed by Secretary Hibbard.

Forest rangers report that feed in the high mountains is at least 30 days later than usual owing to prolonged cold weather.

The Kerman Cured Fruit Association called a meeting for June 4 at the Vinland school house to discuss marketing matters.

Several hundred pounds of gooseberries were shipped from Greenfield, Monterey County, recently. Opening prices were very good.

Bee Inspector Nicholson of Stanislaus County reports that foul brood is present in many of the apiaries in the Patterson district.

The Los Angeles Cream Supply Company which recently started operations at Angiola is now shipping 500 gallons of cream a day from that point.

The Wells-Fargo Express Company wants the butter rate raised. The present rate was established in March and the company claims it is losing money.

A prize herd of 92 cows on exhibition at the Panama Pacific exposition by a cream company has been sold to S. H. Owen of Stockton for approximately $100,000.

Representatives of the California Cured Fruit Exchange will meet the Fresno peach marketing commission to talk over methods of disposing of the expected big crop.

Harvesting has begun in the grain fields of the Pixley district of Tulare County. There are about 8,000 acres in the immediate vicinity of Pixley and the crop is heavy.

The Santa Fe has announced that its extra fast green fruit express train will be placed on schedule immediately following the reopening of the tunnels through the Tehachapi.

A cooperative cannery has been organized at Woodlake, Tulare County. President Campbell of the Tulare Growers' Association assisted in the organization of the company.

Southern California

A Brawley rancher lost 120 acres of standing barley by fire.

The first crate of cantaloupes sent from Brawley to New York brought $27.00.

Riverside County is discussing the possibility of securing a county farm adviser.

It is estimated that the Palo Verde Valley in Imperial County has at least 4,000 hogs.

A number of ranchers at Talbert in Orange County are planting lima beans this season.

The Los Alamitos sugar factory is being overhauled and put in shape for the slicing campaign.

A forestry board for Riverside County is proposed by various improvement associations.

Many citrus growers in the Covina Valley are fumigating the second time to catch the black scale.

The San Gabriel Valley Potato Growers' Association will have 3,000 acres represented in its membership.

Officials of the Hemet cannery announce that their plant will be run this year despite rumors to the contrary.

One thousand acres were planted to blackeye beans this season in the district south of Covina, as an intercrop between young Valencia trees.

Heber, Imperial County, expects to market over 20,000 crates of tomatoes. The tomatoes are unusually fine this year, being large and uniform.

There was a big gathering of farm bureau members at Foster Park, Ventura County, Saturday, May 29. Officers were elected for the year.

Report has it that request has been received from the commissary department of the British army for quotations on 300,000 head of cattle for shipment to England.

An orange grower's association is being organized at Garden Grove, Orange County. It is hoped to have a packing house erected and ready for operation by next season.

Riverside City is conducting a strenuous weed clean-up campaign. Letters are first sent out saying "Please do it." If this proves unsuccessful a compulsory clean-up is enforced.

The citrus experiment station at Riverside reports discovery of the origin of apricot and peach rust. The fungus is found during the wintertime on the twigs of trees and can then be sprayed and destroyed.

An orange packing house at Orange, Orange County, was quite seriously damaged by having a loaded car of oranges thrown against it by a freight train. The car was left standing across the switch beside the packing house.

It has been estimated that it takes approximately 17,000 head of fat stock to furnish meat for the people of Pomona Valley each year. Most of this is shipped in, the sheep coming from Idaho and Utah, and the cattle and hogs from Imperial Valley and Arizona.

The Coast

Recent rains in Utah have been received with rejoicing by dry farmers.

The apple crop of the Northwest has been estimated to be 12,300 cars this year.

The Farmers Union convention, held the last week of May at Elmira, Washington, was largely attended.

The management of the Northwest Live Stock Show is asking an appropriation from supervisors of Nez Perces County, Idaho.

The Washington state board of control reports that the penitentiary mill now has on hand only a million and a quarter of grain bags.

Washington grain farmers are facing a shortage in bags. Large orders have been placed in Calcutta but shipping facilities are problematic.

Sheep by the thousands are being sent over the Northern Pacific to the forest reserves in Idaho. The pasture is reported in unusually fine condition.

The Northwest Live Stock Show is assured for Lewiston, Idaho, this fall by the action of county commissioners in voting an appropriation of $2,500 to the fair.

The annual horse show and strawberry day at Milton, Oregon, brought out a big attendance. The horse show was one of the largest ever held in that section of the Inland Empire.

The Salem brewery of Salem, Oregon, is to be turned into a cannery by the Northwest Fruit Product's Company, which took over the plant after the prohibition law was passed in Oregon.

The Polk County Jersey Cattle Club held a sale at Independence, Oregon, May 12, disposing of 120 head of cattle for over $18,000. The highest price paid was $500 for a four-year-old Jersey cow.

The raising of hothouse fruits and vegetables in Utah has assumed such large proportions that it is expected the state will soon be able to dispense with importations of these products from other states.

The new live stock inspection law in Washington goes into effect June 11. It provides for the killing or quarantining of tubercular cows, though owners must kill if they desire to take advantage of the indemnity offer extended by the law.

The Arizona Farm Improvement Association is asking its members to write to Governor Hunt requesting that as vacancies occur on the board of regents of the state university the governor appoint farmers as the agricultural college is one of the most important branches of the university and there are at present no farmer members on the board.

Governor Stewart of Montana has raised the quarantine on live stock importations from Oregon, Washington, Idaho, Wyoming, Utah, Nevada, Colorado, Arizona, California, New Mexico, Texas, North Dakota, South Dakota, Minnesota, Missouri, Nebraska, Oklahoma, Indian Territory and Louisiana, from the dominion of Canada and the republic of Mexico.

Building to a High Standard, not Down to a Low Price
is our motto

If a better silo than the

IDEAL GREEN FEED SILO

could be built, we would build it

Our TWENTY YEARS of practical experience in Silo building has enabled us to discover and eliminate the faulty features of design and construction and to manufacture a silo that is a thoroughly practical piece of equipment.

We could cheapen the IDEAL GREEN FEED SILO

By putting on ½-inch hoops instead of ¾ inch.

By furnishing a door that would leak instead of the patented refrigerator, air-tight type that is an exclusive feature in the IDEAL.

By not furnishing a 3-ply circular plate at the top to hold the silo rigid and round and prevent its collapsing.

By not supplying an acid-proof, water-proof paint for the inside of the silo.

By making the doors serve the purpose of a ladder instead of furnishing a ladder complete within itself fastened to the silo at one side of the doors.

By faulty design and inferior material and construction and omitting a galvanized steel ventilator for the roof.

But if we did, you would not be satisfied with it. A silo to be of any value must be absolutely air and water tight and of such design, material and workmanship that the shrinkage, while standing empty, can be readily taken up and the silo made just as serviceable as when first constructed without its being necessary to re-build it every year, or to use pitch to chink up the cracks, as is necessary in others.

Send for special Silo Circular A

Live Stock and Dairy

COW HOLDING HER MILK

Written for California Cultivator
By Leroy Anderson

FOR a cow holding her milk we would suggest trying some manipulations of the udder, known as the Hegelund method, a plan worked out by Dr. J. Hegelund of Ladelund Dairy School, Denmark, and described by Prof. Woll in Wisconsin Bulletin No. 96, as follows:

First Manipulation

The right quarters of the udder are pressed against each other (if the udder is very large, only one quarter at a time is taken) with the left hand on the hind quarter and the right hand in front of the fore quarter, the thumbs being placed on the outside of the udder and the fingers in the division between the two halves of the udder. The hands are now pressed toward each other and at the same time lifted toward the body of the cow. This pressing and lifting is repeated three times. The milk collected in the milk cistern is then milked out and the manipulation repeated until no more milk is obtained in this way, when the left quarters are treated in the same manner.

Second Manipulation

The glands are pressed together from the side. The fore quarters are milked each by itself by placing one hand, with fingers spread, on the outside of the quarter and the other hand in the division between the right and left fore quarters; the hands are pressed against each other and the teat then milked. When no more milk is obtained by this manipulation, the hind quarters are milked by placing a hand on the outside of each quarter, likewise with fingers spread and turned upward, but with the thumb just in front of the hind quarter. The hands are lifted and grasp into the gland from behind and from the side, after which they are lowered to draw the milk. The manipulation is repeated until no more milk is obtained.

Third Manipulation

The fore teats are grasped with partly closed hands and lifted with a push toward the body of the cow, both at the same time, by which method the glands are pressed between the hands and the body. The milk is drawn after each three pushes. When the fore teats are emptied the hind teats are milked in the same manner.

On the efficiency of this method with cows that hold up their milk Prof. Woll remarks: "Cows sometimes do not let down all of their milk during a milking, through a congestion of blood in the veins or arteries of the udder, which closes the sphincter muscles at the branching points of the various milk ducts in the udder. The investigations here reported have repeatedly furnished proof that a cow cannot, as a rule, continue to hold up her milk after a few manipulations of the udder have been practiced. When a cow does not give her usual mess of milk and there is no reason to suspect that she is sick, she is very likely holding up a portion of her milk, and in such a case it is especially important to finish up the milking by the manipulation. This will generally give the owner about the usual amount of milk from the cow and will leave the milk secreting glands of the udder in proper condition for the manufacture of milk for the next milking."

CALIFORNIA'S GREATEST JERSEY

The beautiful illustration on the cover of this number shows a California product of which we are all proud. All credit is due to people of means who bring to this state the best blood to be found in Eastern or foreign herds. Even more to be commended is the man who through patient years of work produces a great animal. The greatest record yet made by Jerseys in California is that of Pearl of Venadera, secured through the efforts of Mr. Guy Miller, owner of the Venadera herd. She and her mother are both of Mr. Miller's breeding. A few more Jerseys of this type and a few more breeders of Mr. Miller's type would add wonderfully to the prestige of the Jersey in this state.

Regarding this cow and her breeding Mr. Miller writes:

"I herewith enclose photo of Pearl of Venadera (No. 208644 A. J. C. C.) who by reason of her recently finished yearly test claims the title of Queen of California's Jerseys, as she has set a new record for the breed in California.

"For the 365 days ending April 30, 1915, Pearl gave 11723.9 pounds of milk which contained 700.47 pounds butter fat, making 824 pounds of butter 85 per cent fat. She was fed an average of 13 pounds of grain daily, principally rolled barley. Was fed alfalfa hay throughout the test, some first cutting green alfalfa and foxtail daily in March and April and some green kaffir corn daily in August and September. She was milked but twice daily throughout the test, as is the custom in test work in the Venadera Herd.

"Pearl is sired by the well-known Register of Merit sire, Marigold's Exile King, who has qualified for Register of Merit in Venadera herd by reason of 11 of his daughters qualifying for Register of Merit in this herd. Pearl's dam, Nettie Underwood, is also in Register of Merit with a yearly test of 668 pounds butter, and she has three daughters that have good Register of Merit tests.

"Pearl is proving her ability as a breeder as well as a fat producer. Her two daughters in Venadera herd are both in Register of Merit. One of

them, Jewel of Venadera, who finished her test in January, holds the state record for Jerseys beginning test under three years old. Jewel was but 23 months old at time of starting test and made 520 pounds butter. She is considered a greater heifer than her dam was and promises to be one of the breed's great producers."

TO KEEP HOGS HEALTHY

Give the hogs plenty of fresh water in good, clean troughs. To keep the troughs clean, keep them on clean ground and do not let them set in a mud hole. Coal cinders make a very good fill-in for troughs to rest on and they also make a substantial feeding ground. The growing pigs eat a good many cinders, which aid the digestion, furnishing some of the mineral matter they require. Troughs may be of wood or sheet iron. They should be made with cross guards to keep the hogs from lying down in them. If the hogs lie down in the trough they get dust and mud in the water, which settles to the bottom and makes a slimy mortar that is hard to clean out. There should always be two troughs where hogs are kept in a lot, one for water and the other for slop. Then the troughs should be rinsed with water and any accumulations scraped out before water is put in for the hogs to drink.

Cement troughs are very convenient and are cheaply made, but must be on a large scale and are much harder to handle. They should be made so a man can take a square pointed shovel and clean them out. They are good when a number of hogs are fed together. The troughs should be disinfected twice a week. This should be done with crude carbolic acid and water, as the coal tar disinfectants are distasteful to the hogs, although they are very useful in disinfecting the pens, bedding and lots. They can also be applied to the hogs to kill the lice. In my estimation it is much cheaper to use a half dozen gallon cans of disinfectant per year than to lose one hog.

Another preventive of disease is to use plenty of hydrated lime in the pens and around the lots. There is nothing equal to it on cement and board floors.

Feed plenty of corn to fattening hogs, but sparingly to growing hogs. Feed pigs a combination slop made of middlings, ground corn, some oats and all the rye and wheat you can get. Bran should never be fed without first being scalded. Separator milk is good to use for making slop. Never feed stale slops of any kind. Where a goodly number of cows are kept and the separator milk is fed a fine lot of hogs can be raised.

When the pigs are growing, feed lots of copperas and some salt in the slop. In fattening a drove of hogs I have fed as much as three tablespoons to the barrel of swill. This applies to 150 to 200-pound hogs. Always keep soft coal screenings where the hogs can eat all they want. They will not eat too much.

As to feeding tankage use the money to buy middlings and oil meal instead, and let the packers sell the tankage for fertilizer. Tankage or cracklings from a butcher shop makes very good feed, but should always be given with other feeds and not alone. I think it had better be fed to poultry than to hogs. What I am trying to tell I have learned from experience and not read out of books.

I wish some good fellow would tell me what to feed to cure cholera or keep it away, then I could learn the rest. This one has a cure and that one has a cure. One man says keep the hogs sanitary and give them plenty of pure water to drink; another says to let the hogs run to the chicken coop and clean up the droppings is a sure cure for cholera. Yes, but you had better give strychnine, which is a surer cure, for then you can bury them all at once and not be bothered every morning after breakfast. Another man says to burn the first one that dies and feed it to the rest and they will all be cured, but my neighbor tried it and all the hogs that ate of the burned one died. In my experience the best thing to rid the farm of cholera without giving the serum treatment would be to kill every hog that gets sick at once and burn or bury it at least two and a half feet deep. Throw a half gallon of sulphuric acid and a half bushel of hydrated lime over the carcass before throwing in any dirt. Another serious

ailment of hogs is worms, which are easily combated. I have found sulphate of iron or copperas the greatest preventive, while turpentine is good to eradicate worms in pigs. Pigs rarely get wormy unless stunted or neglected.—G. F. Straw in Farmers' Guide.

TUBERCULIN NOT INJURIOUS

The amount of tuberculin used in testing cows for tuberculosis in no way affects the health of the animal. It requires a dose of from 30 to 40 times as much as is used for diagnostic purposes to have any effect upon the animal. It is held by some that tuberculin will arouse the slumbering germs of tuberculosis in animals and thereby cause tuberculosis to develop more rapidly, but there is no data to support this.

The discoverer of tuberculin, Dr. Koch, found that tuberculin has a tendency to heal the tubercular lesions. The object of his experiment was not to determine a diagnostic agent for tuberculosis, but a curative agent. At one time he thought he had found it, for his experiments indicated that tuberculin did for a short time heal the lesions, but it was not permanent. It was during his investigation he discovered that the injection of tuberculin in tubercular animals caused a rise in temperature. Later work indicated that tuberculin had a slight healing effect upon the open lesions and so far as can be proved does not have any effect upon the health of the animal.—Hoard's Dairyman.

PIG EATING SOWS

Answering a question in an Eastern paper as to curing sows of the pig-eating habit, a contributor says: "If one has a sow that eats her litter or any swine that eat chickens, feed them some vinegar in a little slop and see if it doesn't cure them. If I had a sow that had eaten one litter I would watch her and give her some vinegar shortly before farrowing time. I never have any trouble when I have them running out, but have had them eat chickens and gave them vinegar. After that the chickens would be swarming around them drinking their slop and would have no bother. And so if you have any trouble along this line try the vinegar and if it fails let me know. It will be the first time in my experience."

Constipation causes the cow to have fever. There is also a marked decrease in the milk flow, and often this is the first symptom that the farmer notices. The farmer or attendant should keep his eyes open and so feed as to maintain a normal state of health. The genuine live stock man will know his individuals so well that he can tell at once if a single animal gets off feed. The best treatment is to remove the cause which gives rise to it. The main cause is usually from feeding too long on nothing but dry, bulky foods. Flaxseed or linseed is a good laxative. If constipation has lasted long, repeated small doses of purgatives are better than a single large dose.

Pigs should be weaned when they are about eight weeks of age, and if they have been properly cared for will weigh at this time about 40 pounds. If they are fall pigs they will necessarily be kept in yards, since frosted alfalfa is not a desirable food for them. Skim milk, barley, alalfa leaves, mangel wurtzels and sugar beets will, however, furnish the necessary elements for rapid growth. Skim milk is very essential just after weaning. Spring pigs may be put on pasture when weaned, and an acre will furnish green food for 25 to 30 pigs.

In selecting sows for breeding remember that a young sow should not be permitted to produce more than one litter the first year, but since the period of gestation is 112 days there is no reason why two litters per year should not be secured after that time. Care should be taken, however, so that the pigs will not be born during the very hottest or very coldest season.

The California market is an especially good one for fat lambs, ewes and wethers. It is a mistake to send lambs or sheep to this market unless they are fat, and if not in this condition when off the range it will be found a most profitable practice to market the alfalfa and grain through the sheep.

SILAGE

Answering a question as to the use of silage in California when labor at time of cutting of silage is so high-priced, Hoard's Dairyman says:

"If crops of ten to 15 tons of forage can be secured from an acre of corn, it is our opinion that it would be advisable to build a silo. Alfalfa is a splendid feed and good results are had when it forms the major part of the ration. For best results in milk production, however, its high protein content should be balanced with some feed high in carbohydrates, such as corn, corn silage, or barley. Then too it is doubtful whether it is even wise to restrict the feed of cows to one kind for long periods of time. It not only may affect production, but in some cases at least we know it affects the health of the animal.

"It may be said that dairymen who have large producing cows, that is, cows averaging better than 20 pounds of milk daily, find that silage is an important factor in the ration, even though alfalfa can be cheaply provided."

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Caked Udder

Have a cow which dropped her calf about the middle of May. Her udder is very large and hard. Acting upon the advice of friends I began milking her before the dropping of the calf. The hardness and inflammation continued and I allowed the calf to run with her, as I could not be at home to milk more than twice daily. The calf must have bruised the udder and the inflammation still continued. I called a veterinarian, but he seemed unable to relieve her and I later called another. He gave treatment, rubbing in warm water with remedies and packed in antiphlogistine. He also gave internally Epsom salts and other medicine. The cow is now in generally good condition, with good appetite, but still has harness in udder.—Subscriber, Los Angeles.

Your veterinarian did right, but from your description it was a bad case and will require some time for complete recovery. You had better get the following medicines for the cow and continue to rub the udder and milk it out carefully at least three times a day: Epsom salts, three pounds; common salt, two pounds, and nux vomica, four ounces. Mix and give a handful in the feed once a day. Also get four ounces of tincture of aconite and give a teaspoon morning and evening. Be careful that she is not overfed and give green feed that will keep the bowels open. If you want the calf to help in the milking then you must first milk out most of the milk, leaving some in the quarters that are swollen and let the calf do the rest.

Poultry for Profit

JUNE IN THE CHICKEN YARD.

Written for the California Cultivator
By Jean A. Koethen.

JUNE is one of the hardest months for the poultry keeper. Incubators and brooders are ready to be cleaned and put away. The wearisome but fascinating labor of incubating the chicks and starting them on the road to a vigorous and profitable maturity is over, and now comes the steady grind of keeping them going on that road.

When the first warm days come we Californians, whatever our work, find it a little hard to overcome the tendency to let go. The spring rush is over and with it has gone the elasticity of nerve and muscle that is so easy to keep while chilly spring winds are blowing. Now is the time when little chicks will be neglected, sturdy young pullets left to raise themselves, and the enemies of the flock permitted to get in their deadliest work. If "unceasing vigilance" is the poultry-keeper's motto in January it is doubly so in June.

The most difficult task in June is the keeping down of the "mighty" mite. I make no exceptions. Better let your chicks go half fed and your hen do without green feed or the nitrogenous materials needed for egg making than to let the insidious, deadly red mite get into their sleeping quarters. When I see a chick look droopy I do not, as I once did, begin to doctor. I go after the mites. April, May and June are the breeding time for these pests, and they are more active and harder to fight then than later in the summer. Coops used for new broods this month should be of new wood and those used for the older chicks by no means old. Once a week is none too often to go over roosts, coops and brooder boxes with kerosene and crude carbolic acid, one part carbolic to three or four of kerosene, and it is a good plan to wash the sleeping boxes of the younger chicks daily with the garden hose. I have often been amazed to see how hard it is to kill these pests when once they take possession of a coop. Water will not do it. Kerosene alone doesn't faze them. Fire only drives them to the outside. Crude carbolic acid or some other carbolic preparation, such as Carbolineum, will keep them out, but once they are in, cresol disinfectant, which is stronger yet, is the best thing for getting rid of them.

Commercial cresol may be bought from the druggist for about 30 cents a pound. Shave a ten-cent cake of laundry soap into a pint of soft water, steep till a paste is formed, stir in a pound of cresol, and when the paste is dissolved add a gallon of kerosene. The mixture is best applied to the walls and roof of the house and to nest boxes, coops, etc., with a brush.

The March pullets have been by this time separated from the cockerels, and the latter should be marketed this month. It is hardly practicable on the farm to use fattening crates, but the cockerels should be confined and fed as much moist mash as they will eat with a relish. A good fattening ration consists of two parts (by weight) corn meal, one part shorts, one part ground oats, eight parts buttermilk or sour skim milk. Another, which is a little less forcing, consists of 15 pounds each of bran, barley meal, shorts, corn meal, six pounds meat scrap, two pounds powdered charcoal.

The pullets should be on range if there is any range to be had. They need the development which comes from constant exercise and the variety of ration which free range always supplies. There is nothing better than good alfalfa range for these pullets which are to be the fall money-makers. The dry mash which is fed to the laying hens with a good feed of grain at night and a smaller one in the morning, with the alfalfa for green food and bugs and worms as appetizers, will keep these active young birds developing and bring their egg organs to a healthy maturity at the right time. Laying hens may do very well in confinement, but pullets need the exercise that they get only on range.

The April chicks are ready to roost and may easily be transferred from the brood coops to regular roosting houses. When I began to raise chickens I was much puzzled by the various and contradictory directions given for changing chicks from brooder to cold brooder and from cold brooder to roosting house. Now I have worked out a little system of my own which is very simple and no trouble whatever. The chicks with hens are left with the hens till the latter begin to lay, which is three or four weeks. Then they remain in the coops where they have been brooded, sleeping, if the weather is cold, in boxes of straw (the ordinary "lug" box does very well for this) or, if it is warm, on the floor of the coop till they are ready to roost, which is about two months of age. Then I transfer them to the roosting coops but let them have the lug boxes to sleep in under the roosts till they have learned to roost. Brooder chicks are taken from the fireless brooders at the age at which a hen-mothered chick would leave the hen, and treated in the same way.

May chicks are in June somewhere in this transitional stage between mother and roosting coop and need the most careful watching of all, for it is these chicks that the mites seem to find first and that are mostly killed by these pests. Their coops and boxes should be cleaned every day and the straw on which they sleep powdered often with good strong louse powder. They need a liberal ration, too, for growth is rapid at this age, and time is money these June days. If there is sour milk for them and good alfalfa range they are fortunate indeed. The poultryman's paradise of which I dream is a big alfalfa ranch where cows and chickens eat and range side by side. The family get the cream and the skim milk quickly turns the chicks into the finest of "milk-fed" broilers and high producing pullets. Sour milk and alfalfa almost make a balanced ration by themselves and reduce the cost of production to a minimum. I wonder why more farmers do not work this alfalfa-milk-chicken scheme.

Now is a good time to cull the hens and get the unproductive ones off to market. The hens that have raised broods are laying well but in a flock of non-sitters there are sure to be some that are letting up in their laying or that have shown in other ways that

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SEEDS AND PLANTS

Spineless Cactus — Plant now. Tremendous yield of our plants makes possible these prices: Per 100, $10; per 1000, $75. Special collection of 20 fruiting and forage varieties, only $3. Parent stock purchased direct from Luther Burbank. El Dorado Cactus Nursery, Cupertino, Cal.

Recleaned—Inspected. Sudan Grass Seed $16.00 per hundred, F. O. B. Los Angeles. Order now. BURBANK SPINELESS CACTUS and GIANT WINTER RHUBARB at special prices. Black Bros., 455 Lucas, Los Angeles.

Burbank Spineless Cactus—Hardiest varieties, "Melrose" and "Special." Strong, matured slabs. $8.50 per 100; $50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

Soudan Grass Seed—First class guaranteed seed, free from Johnson grass; now 20c per pound or $15.00 per hundred, f. o. b. Santa Ana. C. E. Lewis, R. 5, Box 52, Santa Ana, Cal.

For Sale—Yellow sweet potato plants, $1.50 per thousand F. O. B. Santa Ana, Cal. S. D. Teel, R. D. No. 3, Box No. 8, Santa Ana, Cal.

Attention Dairymen—Plant Sorghum for green feed or ensilage. Seed for sale in lots to suit. A. L. Sayre, Madera, Cal.

Genuine Burbank Spineless Cactus—Strong mature slabs, $6 per 100—$50 per 1,000. Thos. Cathers, Morgan Hill, Cal.

W. R. P.

The supplying of bacteria to the various members of the leguminous family greatly increases the possibility of big crops. Nitrogen is the most expensive element required in creating soil fertility. If millions of minute forms of life can be made to gather this nitrogen for us from the atmosphere it adds wonderfully to the economy of plant production. Still more, in some soils where there seems to be absolute dearth of this nitrifying bacteria success may be had by the introduction of cultures. The production of these cultures has become a factor in farming operations. Attention is called to the advertisement of the Western Rock Products Company, Balboa building, San Francisco, which concern is making a campaign for better soil conditions in California. It sells guaranteed legume bacteria and urges that all alfalfa and other seed should be inoculated with this culture. A postcard to the concern will bring a fund of information in a little 12-page circular just being sent out.

Mary had a little lamb,
With French peas on the side;
But when the waiter brought the check
Poor Mary nearly died.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and addres. Unsigned communications receive no attention.

Pears Not Fruiting

I have three varieties of pears, fine healthy trees, which do not bear. They are Seckel, Winter Bartlett and Kieffer. The Seckel and Winter Bartlett do not blossom. The Kieffer blossoms heavily but does not set.

Would like to know if these varieties are not sure bearers in this section and what one can do if anything to make them bear. Trees are six years old and good healthy specimens. Any information or advice concerning same will be appreciated.—Subscriber, Lankershim.

Your experience coincides with the results we obtained with the three above named varieties at the Pomona experiment station. Occasionally we would have a crop of Seckel, but never of Kieffer or Winter Bartlett. We had over 50 varieties growing in the orchard and bees were abundant, so we conclude that cross pollination had no practical effect on those varieties. We would advise grafting over the Winter Bartlett and Kieffer should they fail to bear during the next couple of years. I think Seckel will come out with enough fruit to justify you in keeping it. Beurre Clargeau, Beurre Hardy and Easter Beurre proved prolific with us and were of good quality.—J. W. M.

Cherries in Southern California

Mr. Rechnitzer of Escondido writes that he has English Morello cherry four years old that is bearing well, having borne since the first year after planting. The above is in answer to the subscriber at National City who wished information as to a variety which would bear in the South.

Electricity from Wind Power

The Kansas agricultural college, or rather its department of electrical engineering in charge of Prof. Reid, is investigating as to the use of wind power in generating electricity. Prof. Reid wishes information as to whether this matter has been tested out in California. We know of no such effort in this state and will appreciate information from our readers. Has wind power ever been used in generating electricity for home use?

Disinfecting Incubators

Would you kindly print directions for sterilizing or fumigating incubators to be closed for the summer.—Subscriber, Pasadena.

For disinfecting incubators and brooders I know of nothing better than creolin which may be bought at any drug store. Pour into a basin of water enough creolin to give the water a milky look, and wash thoroughly, being especially careful to reach every crack and crevice of the brooders. If you suspect the presence of mites in the brooders you might fumigate them with sulphur candles or with powdered sulphur. I think directions for use come with the sulphur candles. If you use the powdered sulphur just put two or three burning coals in an old can or basin and sprinkle on the sulphur. Place in the brooder, close tightly, and leave half a day. You must see that there is a good smoke and enough sulphur to burn for some time.—J. A. K.

Not True to Breed

I have been breeding Black Minorcas for three years. Have followed a kind of line breeding and have no other breed. Why should I get a baby chick from them like a Brown Leghorn?—Subscriber, Encanto.

I. K. Felch tells of receiving a partridge-colored game hen from a friend and mating her to a game of his own breeding. The hen and her daughters bred true to color for three years and then began to throw occasional nearly black chicks. He investigated and found that 20 years before a black hen had been mated into his friend's flock to deepen the color. The cross lay dormant for 20 years and then reappeared and continued to reappear for ten years more. If you could go back 30 years into the ancestry of your Minorcas you would very likely find somewhere a Brown Leghorn cross which now shows itself in this chick. An occasional "throwing back" like this does not, of course, affect the purity of your stock so long as the birds are not used as breeders.—J. A. K.

Blister Mite

An inquirer wishes information regarding control of blister mite which is affecting his pear leaves. Essig's new "Injurious and Beneficial Insects of California" gives the following:

"The control of this mite is becoming quite an important factor in the raising of pears, especially in the Sierra foothills in Placer, Nevada and El Dorado Counties. Many of the sulphur preparations, as pure flowers of sulphur, flowers of sulphur and hydrated lime, lime-sulphur and atomic or milled sulphur have been used. The commercial lime-sulphur (1-13) has given very good results. Atomic sulphur has not been thoroughly tried out, but judging from its efficiency in controlling other mites it it also suitable for this one. The most important consideration is the time of application, which should be made in February, just as the buds are opening. At this time the hibernating adults are moving to the young leaves to lay eggs, and a spraying at that time will kill nearly all of them."

One should not use the commercial lime-sulphur at this time of year of the February strength recommended by Mr. Essig.

Probably Rheumatism

During the cold weather of the latter part of April and the first of May a New Zealand rabbit became stiff in its legs and entire body; the jaws were locked and it could not eat. Was this rheumatism and would drafty hutches and cold weather bring it on?—Subscriber, Los Angeles.

Your solution is probably right, as cold, damp hutches and drafts are fatal to these animals in cold weather. It might be the animal so affected was poisoned by some weed, grain or feed, as this cause would often have the same effect on them as you describe. Rabbits are very much subject to rheumatism when left exposed to the elements, as above described.—R. V. M.

MARRIAGE A LA MODE.

"When is their marriage to be solemnized?"

"As soon as it's financed."

Prince Albert tobacco is the real joy smoke!

Here is another just-elected member of the Prince Albert "old-time jimmy-pipers club." This is John O'Reilly, of East Providence, R. I., who has just passed the century mark. Mr. O'Reilly is one of those grand old men who has come to this ripe age with the joys of his friendly jimmy pipe fresh in his mind each morning. He has always been a liberal smoker.

Just as soon as you smoke some Prince Albert tobacco in a pipe or cigarette, *just that soon* you'll understand how different it is in flavor, in aroma and in genuine goodness. No other tobacco can be like Prince Albert. *The patented process fixes that* — and removes the bite and parch!

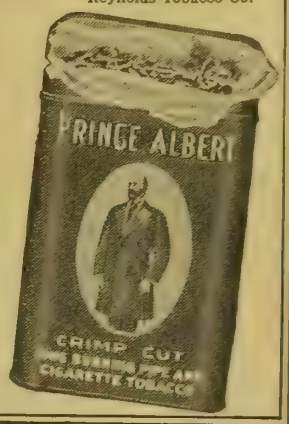
You come on and get pipe or cigarette makin's happy. *Know yourself* what it's like to smoke *all* the tobacco you want, and smoke as *long* as you want without even tingling your tongue!

PRINCE ALBERT

the national joy smoke

Copyright 1915 by R. J. Reynolds Tobacco Co.

just makes it possible for *every* man to renew his love for his friendly old pipe, or to get a *new* idea how good a hand-rolled cigarette can be. You've no idea of the satisfaction, content and restfulness *that's yours* if you'll get chummy with P. A. Lose no time getting acquainted with this real and true man-tobacco.



Buy Prince Albert everywhere tobacco is sold. Toppy red bags (handy for cigarette smokers), 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors—and—that classy pound crystal-glass humidor with the sponge-moistener top that keeps P. A. fit as a fiddle!

Cornstarch Will Help To Solve That Cooking Problem

Many Housekeepers Find It Valuable Aid in Planning Bill of Fare

One of the problems constantly confronting the housewife is the assuring of a pleasing variety to the bill of fare. One of the best aids that we know of in this connection is a thorough knowledge of the many uses of that delicious food product—Cornstarch. While all cooks necessarily are more or less familiar with it, a complete knowledge of the possibilities of cornstarch would prove a revelation to most of them.

For instance, in making pancakes, the use of one-third cornstarch instead of all flour, will produce most pleasing results. When eggs are scarce, and several are required, a teaspoonful of cornstarch may be used very satisfactorily in place of one egg. All kinds of crusts, steamed puddings and dumplings are much better when part cornstarch is used instead of flour. When short of cream, cornstarch, with milk and egg, makes a good substitute.

Cornstarch is the basis of dozens of toothsome puddings and desserts; but the results naturally will not be satisfactory if an inferior quality is used. Those who obtain the best results with cornstarch recipes most unqualifiedly recommend the famous Kingsford's brand, which can be obtained at all modern grocers. Insist upon Kingsford's and ask for the Kingsford's cook book containing hundreds of cornstarch recipes.

The Great Home Builder

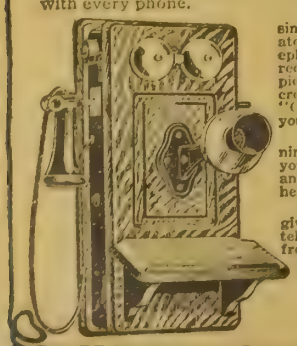
WHAT after all is more worth while than bringing comfort and safety into the home? Think what the telephone has done to tie the country house to the town and the town to the city. Don't be isolated. Get into touch with the voice of the big outside world. Know the prices that rule on farm products. Know about the party at your neighbor's house. Bring to your whole family the safety that comes with the knowledge that in the time of illness or fire the whole community is within call.

Kellogg Telephones

have won their way into homes all over America because of the quality of service they give. Did you know there is a big difference in telephones? There is. Kellogg phones have to undergo an inspection more rigid than other makes. They pass through 37 distinct tests before they leave the factory. That means dollars and cents to you.

As a matter of fact, it is not uncommon for the repairs to cheaper telephones to cost in a few years more than the first cost. Kellogg instruments go on year after year carrying the most delicate sounds perfectly without repairs.

Kellogg Transmitter is guaranteed for five years. A Kellogg lightning protector goes with every phone.



Every part of the instrument is strong, simple and durable. Big, powerful generator that will ring efficiently with 40 telephones on the line. Unbreakable receiver and transmitter mouthpiece. Long life batteries. Secret service push button to ring "Central" without ringing your neighbors.

Let us help you in planning your line. We can tell you how to avoid mistakes and save money. Our expert help costs you nothing.

Literature and bulletins giving the latest ideas about telephone construction sent free.

The Household Department

THE BOY FROM TOWN.

Last night a boy came here from town
To stay a week or so,
Because his maw is all run down
And needs a rest, you know.
His name is Cecil, and he's eight,
And he can't skin the cat—
His maw she calls him "Pet;" I'd hate
To have a name like that.

He wears a collar and a tie
And can't hang by his toes;
I guess that I would nearly die
If I had on his clo's;
He can't ride bareback and today,
When we slid on the straw,
He ast if rooosters help to lay
The eggs I pick fer maw.

When our old gander hissed he run
As though he thought he'd bite,
And he ain't even shot a gun
Or had a home-made kite;
He never milked a cow, and he
Can't even dive or swim—
I'd hate to think that he was me;
I'm glad that I ain't him.

He thinks it's lots of fun to pump
And see the water spurt,
He won't climb in the barn and jump,
For fear of gettin' hurt.
His clo's are offle nice and fine,
His hair's all over curls;
His hands ain't half as big as mine;
He ought to play with girls.

A little while ago when we
Were foolin' in the shed
He suddenly got mad at me,
Because I bumped his head.
There's lots of things that he can't do;
He thinks that sheep'll bite,
And he's afraid of ganders, too;
But he can fight all right.—S. E. Kiser.

THE CAT AND THE DOOR BELL.

AMORE perfect example of worthless feline felicity than Ginger never lived; and yet he lives, and no one suggests that he might better make room for a cat with fewer toes upon his feet and a greater disposition to lay them upon the rats and mice that occasionally show themselves on the place. Topsy, the little black mother of all the other cats upon the farm, is worth many times her weight in steel traps, and the enthusiasm that she annually shows for "better babies," and more of them, makes her rank as almost an expert in eugenics. Big brother Mutt lets few days pass by in which he does not bring to the house some trophy of the chase, and he treads the path as proudly when he has robbed the cradle of an infant mouse as when he carries a rat with tail nearly as long as his own and a body that makes its captor hold his head high to keep it from the ground. He couldn't be spared, but Ginger, with black feet that look as though they were encased in padded boxing gloves, was never known to eat any game that was not brought to him or to display a useful trait of character in any line. When small he was so full of kinks that Ginger seemed the only name appropriate for him, but in his adulthood he faces life with sublime confidence in three square meals a day, ready provided. Behind that confident, optimistic smile of his lie some brains, however, and these have probably been the means of prolonging his life and may do so indefinitely. If he hadn't them how could he have learned that the way to gain entrance to the house was to ring the door bell and wait for some one to open the door? Our sitting-room door is armed with an old-fashioned gong that is struck by pulling down an outside lever. This lever has a porcelain knob on the end, and requires some force to operate it. When about half-grown, Ginger learned in some unknown way that if he would reach up and hook both fore feet over that white knob and then pull down until he heard a loud bang some one would open the door. No one ever made any effort to teach him this, unless it might have been Mutt who stands up and pounds the door knob with one paw when he wants to come in, but, in some way, he certainly learned it and he put his knowledge to good use. Through the summer a screen door kept him away from the bell, and it was thought that he would probably forget his skill as a bellringer. The other night, however, the screen door was fastened back, and it being somewhat cold Ginger evidently wanted to come in and warm his 28 toes. About midnight a loud ring at the door awakened the man of the house and brought him to his feet. Upon opening the door in strutted Ginger with his everlasting smile and confident purr. He promptly went out again at the back door, however, and the man returned to bed. Nothing again disturbed the family's sleep until about five o'clock in the morning when the door bell rang. Nobody was fooled this time and nobody went to the door; again the bell rang, and again and again, until it was struck six times in succession. Maybe there was a neighbor at the door and, if not, such persistence certainly called for recognition. The door was opened, and in gurgled His Inky Blackness and padded his way to the sofa where he knew that a soft blanket lay folded.—Rural New Yorker.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Fried Fruit Mush, Maple Syrup
Cheese Omelet
Dates and Oatmeal Cookies Coffee

Lunch or Supper

Baked New Potatoes
Fried Ham with Cream Gravy
Asparagus Cucumber Salad
Gingerbread Tea or Milk

Dinner

Broiled Lamb Chops Baked Noodles
Peas with Parsley and Butter Sauce
Spiced Gooseberries Rolls
Brown Sugar Pudding Coffee

Date and Oatmeal Cookies

Two cups oatmeal, one cup lard, two cups brown sugar. Add one-half cup hot water and the oatmeal, into which has been sifted one teaspoon soda. Add flour to make a very soft dough, roll very thin, cut out with small cutter and bake in moderate oven. Put two cookies together with the following filling: One pint stoned dates, two tablespoons granulated sugar and a little hot water. Do not cook but work into smooth paste with a spoon. For a change one cup of chopped nuts or raisins may be added to the cooky recipe and the filling omitted, or sugar may be sprinkled over the dough and rolled in before cutting out.

"Cinnamon" Gingerbread

One cup New Orleans molasses. Into a teacup put two level teaspoons soda and fill cup slowly with hot water. Add to molasses with half cup sugar, two tablespoons butter, half teaspoon vinegar, cinnamon, two cups flour and lastly one egg. Add raisins if desired.

Brown Sugar Pudding

Two cups of light brown sugar; two cups of boiling water, two heaping tablespoons of cornstarch, one-half cup of walnut meats broken into small pieces. Bring sugar and water to a boil. Thicken with cornstarch which has first been dissolved in a little cold water. Cook in a double boiler until it is thick. Just before taking from the fire add the nut meats. Serve cold with whipped cream.

Spiced Gooseberries

Stem berries, wash thoroughly and allow to drain and become crisp. Make a syrup as follows: To one part fruit

Housekeepers Using Syrup More Than Ever Before

A Better Knowledge of Its Diversified Uses Responsible for Increased Demand

Syrup plays such an important part in the preparation and serving of our food that a thorough knowledge of its uses is essential to every efficient housekeeper.

Nothing pleases the youngsters better than a thick slice of bread thickly spread with a rich syrup—while the grown-ups enjoy their griddle cakes and waffles best when served with this same delicious dressing.

Syrup is really indispensable in the preparation of a great variety of cakes, cookies, muffins, icings, pies, puddings, sauces, candies and many other delicacies too numerous to mention.

One cannot hope to obtain the best results, however, if an inferior brand of syrup is used. Culinary experts everywhere unhesitatingly recommend Karo Syrup for every household use—and it is safe to be guided by their experience. Karo is as clear and sweet as honey, richer in consistency. It can be obtained at all modern grocers. Order some today, and ask for the little Karo cook book, containing hundreds of valuable recipes for making all the toothsome delicacies referred to above. Try out each of these recipes, and you will always keep Karo in the house thereafter.

Ants Numerous This Warm Weather

Much Suffering Can Be Prevented By This Simple Method of Relief

The warm summer weather is very pleasant in many ways, but it always brings forth one intolerable nuisance—ants. This pest has proved the despair of many a housewife, who has tried various methods of getting rid of them—only to have them return again.

Women everywhere, therefore, will rejoice to learn that certain and lasting relief from this plague is now at their disposal. A Los Angeles baker, himself a great sufferer from ants, has prepared a paste which will not only drive the ants out of your place, but will keep them out thereafter. Ants cannot exist where this paste is used—its effect appears almost supernatural.

This remedy is put up for general use under the name of Kellogg's Ant Paste and can be obtained at all up-to-date druggists. Try a package today, and you will have no more trouble with ants.

JAMES R. TOWNSEND

Solicitor of American and Foreign **Patents** Copyrights Trademarks and Labels registered. Suite 711 San Fernando Bldg. Los Angeles. Phones:- Home A4619; Sunset Main 347

use one-half as much sugar, one-eighth as much vinegar and one-half as much water as vinegar. For each pint of vinegar allow one ounce of stick cinnamon, two scant teaspoons each of cloves and mace. Boil about 20 minutes and skim. Add the fruit and cook until a little of the liquid tried on a cold plate shows indications of jelling slightly. Fill hot sterilized jars, seal and turn upside down until cold. Test to see that none are leaking, label, wrap in paper and store in a cool place. (As the strength of vinegar and spices varies to a considerable extent it may be necessary to add more of these, or possibly additional sugar may be needed.)

HOUSEHOLD QUERIES

Rose Beads.

Please give a good recipe for making rose beads; what kind of roses are best for this use?—Subscriber, Van Nuys.

Put the rose petals through the food chopper at least 15 times then spread out on a rusty tin for three days, each day running through the food chopper once, or kneading well with the fingers. If they dry out a great deal, moisten with a little water. Form into beads the desired size, measuring in a small thimble or the bowl of a spoon to insure uniformity, and stick on a hat pin to dry. When thoroughly dry dip in olive oil, place in a flannel cloth and rub briskly to give the desired polish. They shrink considerably during the drying process. Any variety is used.

To Clean Enamelled Wood Work

Will you tell me the best way to clean white enamelled wood work in a kitchen?—Subscriber, Van Nuys.

We believe a good mild soap with plenty of hot water would be the best method of cleaning white enamelled woodwork.

Curing Rose Petals.

Please give method of curing rose petals.—Subscriber.

We know of no particular directions other than to gather the petals and spread out in the sun to dry, turning frequently that they may cure evenly. Bring in the house at night to prevent their absorbing dew. When sufficiently dry place them for a very short time in a hot oven to destroy eggs of insects which may have been deposited in them and use as desired.

We will be glad to receive any further suggestions from subscribers.

SUMMER LAUNDRY WORK

Written for the California Cultivator
By M. A. H.

To prevent mildew do not put anything away damp, and if any spots of mildew are found on the clothes cover the spots with salt and then squeeze lemon juice over the salt and place in the sun. Sometimes the juice of a perfectly ripe tomato will remove the spots.

Muslins of a doubtful color may be washed in rice water, without soap, rinsing them out in clear rice water to keep the starched quality.

Gum arabic water should be used in the starch for both white and colored muslins. This is prepared by pouring a pint of boiling water over two ounces of fine white gum arabic and allowing it to stand over night. In the morning pour it carefully from the dregs into a bottle and use a tablespoon of this gum arabic water in starch made in the usual way. The best way to stiffen all white laces and all crocheted articles is to put them through thin gum arabic water as this gives them just the right degree of stiffness.

Brown linen may be kept fresh and new looking by washing through starch to which a cup of strained coffee has been added. No soap should be used and the garment should be hung over the line without rinsing. When about half dry iron on the right side with hot irons. Use a tape measure when ironing linen skirts so as to have them the same length all around. Iron crosswise to make it short and lengthwise to make it long, as a linen skirt may be stretched several inches either way while damp.

(Continued on Page 671)

Gas Stove Convenience with Kerosene

Hot in *Your* Kitchen?

No need of it if you cook with a good oil stove. The heat is concentrated on the cooking—not radiated throughout the room.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Abundant heat—always ready at the touch of a match—like gas. Can be turned out the minute you finish cooking. Cooks anything your wood or coal range does—and there's no heavy hods to lug—no dirt or ashes. No odor. Does not taint the food. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

HAY

Under date of June 5, Scott, Magner & Miller say:

Receipts of hay during the week ending today have amounted to 3660 tons. Prices have been fairly well maintained, and on choice grades better prices have been realized.

During the past week we have had splendid haying weather and the mowing machines are actively engaged in cutting the crop throughout most of our hay districts. The warm north winds of the last few days have also had a certain effect in certain localities where the wind has prevailed in a marked degree.

Many of the farmers have been undecided as to whether to make grain or to cut for hay. It is the natural tendency on the part of the farmer who has always made hay to continue to do so, particularly in view of many of the facts connected with the present hay situation. It is thought that most of the old crop on hand will be disposed of. If the surplus can be taken off this market it will leave a clean road for the marketing of the new crop. There is some inquiry for alfalfa, and same can be readily sold if of fairly good type. There is nothing new to report in connection with straw.

Fancy Wheat Hay (lt. bales)	13.00@14.00
No. 1 Wheat or Wheat and Oat	11.00@12.00
No. 2 Wheat or Wheat and Oat	8.00@9.00
Choice Tame Oat	12.00@12.50
Other Tame Oat	7.50@10.00
Barley	5.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, per bale	40@45

GRAIN

Citrus Fruit Market

LOS ANGELES, June 9, 1915.

Practically all navels have been sold, as have the seedlings, sweets, and all varieties excepting Valencias. Of these there are perhaps 7,500 carloads yet to go forward. The fruit is fine and every indication is for good sales. The only feature which is not favorable is the fact that the peach crop generally over the East is immense.

"The situation as to lemons is not rosy." Another says, "Lemons never faced a more serious situation than at this moment." There are on dock and afloat over 300,000 boxes of foreigns. 100,000 of these must be sold during the next week. California has 200,000 carloads in storage. To make the situation still worse the weather man is turning loose cold, drizzling rain. In some cities during last week the highest temperature marked was 60 degrees. Two weeks of hot weather would clear the situation and until that comes lemons must be content with very low prices.

Shipments

Shipments of oranges to date from Southern California since November 1, 1914: 26,445 carloads, lemons 4,105, total 30,550. To same date last season: oranges 28,729, lemons 1,751, total 30,480. From Tulare County: oranges 5,618, lemons 197, total 5,815. To same date last season: oranges 5,662, lemons 30, total 5,692. From northern counties: oranges 630, lemons 2. To same date last season: oranges 404, lemons 5.

NEW YORK, June 7.—Twenty-two cars navels, sixteen Valencias, one Jaffas, one St. Michaels, one seedlings, eleven mixed cars, and six cars lemons sold. Market higher on navels; Valencias and lemons steady. Cloudy.

SUMMER LAUNDRY WORK

(Continued from Page 669)

Fine white waists and dresses come out beautifully white by putting them to soak in warm suds made with borax soap chips and soft water and very sheer materials only need to be squeezed through the suds to remove all soil in the fabric. Make a strong lather in warm water with the soap chips then put in the garments and let them soak for an hour before rubbing out. There is nothing better than the suds made with borax soap chips for washing all kinds of table linen and the pretty crocheted articles used so much now and for white counterpanes and the embroidered pillow slips and covers. Some housekeepers dissolve enough of the chips in hot water to make a thick solution and keep in a glass jar closely covered and then it is ready to use and a very little of the solution stirred in hot water will make a nice lather. To make white garments a good color, rinse them through water slightly blued, then through a deeper shade, and rub well so that every part will get its share of blue.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Water Right

Water company owns pipe line across ranch, having paid for right-of-way, they say, when laid a number of years ago. Ranch has changed owners a number of times and is finally sold to E, who has owned same for three years. A number of years ago a pipe line was laid connecting with water company's line to water part of ranch. Now, much to E's surprise, who bought the ranch supposing his pipe line rights were secured with ranch, the water company informs him that he has no right to use the line. Have any rights been gained by undenied use for the eight or ten years? E's irrigation system is spoiled without access to water company's line on the dates his water is sent to him.—Subscriber.

When E purchased the ranch he acquired all the appurtenances thereto and it has a number of times been held that the right to water in pipes used for delivering it to the land and the pipes themselves constitute an appurtenance to the real property. The right in water which has been diverted into ditches and other artificial conduits for the purpose of conducting it to the land for irrigation has been uniformly classed as real property in this state. It is quite apparent, however, that the entire facts in this case are not presented in the above question and it is probable that this answer would not be a proper one to make if the entire facts were given.

Return of Shipping Cases

Please give me an epitome of the law regarding the return of crates, coops, cases, etc., used in shipping produce to commission merchants.—Subscriber, Salada.

An answer to the above question would be the work of a textbook and it is impossible for this department to do more than answer specific questions.

Community Property

Does property accumulated after second marriage (no children by second marriage) all go to children by first wife or is it divided between children and second wife?—Subscriber.

As has been here frequently stated before, property accumulated subsequent to marriage is community property. Upon the death of the wife it goes to the husband without administration; upon the death of the husband it goes one-half to the wife and the other one-half is subject to the disposition of the husband by will, so that in the above case upon the death of the husband he could will only one-half of the property to the children by his first marriage.

Community Property

A woman at the time of marriage had about $700 in money and about $650 worth of stock, and the husband had about $250 in money and about $350 worth of stock and implements. The money was invested and now amounts to about $4,000 in property and $7,000 in money, all in husband's name. Is wife entitled to any less because the husband holds it in his name? If a joint deed was made out, including a clause for ownership in the survivor, what would then be the wife's share of the $7,000?—Subscriber.

For the purpose of ascertaining the community property, the husband and wife or their respective heirs are each entitled to prove what moneys, which were the separate property of either, were put into the common fund, but such moneys or property cannot be considered as separate property if they cannot be traced or segregated from the mass of community property; in other words, in the above case, property standing in the name of the husband, the burden of proof would be upon the wife or her heirs to show what proportion of the property was the result of the initial investment of the wife's separate property, together with the increase thereon. Upon such proof, even though property may stand in the name of the husband, the proportion found to be the separate property could be set aside, but in a case such as the above it is doubtful if the wife would be enabled to make a sufficiently clear case. An arrangement can be made by deed providing for ownership in the survivor, but the best method would be reciprocal wills.

JUNE IN THE CHICKEN YARD

(Continued from Page 665)

they are not worth keeping. The old hens and the overfat hens, the hens that seem to be lacking in vigor and the hens that have not made a good record should all go in June before prices drop. This year we need to cull more closely than ever because of the high prices of feed. "Let not one worthless hen escape" is a good motto for a bad year. Let us cull remorselessly, not only the hens but the pullets. Pullets that are obviously culls, that are off in color or weight or that have been slow in development, should go to market with the cockerels. Sometimes a pullet is a pullet, but this year only the best is worth while The only way to beat the high feed prices is to have more paying hens.

Doing Business with a Business Concern

The business man is an important factor in your daily life and happiness.

He may raise wheat or cattle; he may manufacture flour or shoes; he may run a grocery or a dry-goods store; he may operate a copper mine or a telephone company. He creates or distributes some commodity to be used by other people.

He is always hard at work to supply the needs of others, and in return he has his own needs supplied.

All of us are doing business with business men so constantly that we accept the benefits of this intercourse without question, as we accept the air we breathe. Most of us have little to do with government, yet we recognize the difference between business methods and government methods.

We know that it is to the interest of the business man to do something for us, while the function of the government man is to see that we do something for ourselves—that is, to control and regulate.

We pay them both, but of the two we naturally find the business man more get-at-able, more human, more democratic.

Because the telephone business has become large and extensive, it requires a high type of organization and must employ the best business methods.

The Bell System is in the business of selling its commodity—telephone service. It must meet the needs of many millions of customers, and teach them to use and appreciate the service which it has provided.

The democratic relation between the customer and the business concern has been indispensable, providing for the United States the best and most universal telephone service of any country in the world.

Little Stories of Success

No. 8.

R. F. Schmeiser of Winters, who bought a 75-h. p. Caterpillar back in 1913, wrote us recently: "I am farming 1500 acres and I have used nothing but my Caterpillar to do the farm work with since I have had it; and besides my own work, I have done work on the outside which amounted to over $10,000 for the year 1914. This outside work consisted of plowing, harrowing and harvesting for my neighbors, and hauling rock and sand for the State Highway."

Mr. Schmeiser has some interesting figures on work done with his Caterpillar—harvesting 3100 acres in 60 days—hauling in one week 1596½ tons of rock and sand for an average distance of 2½ miles—plowing 260 acres in 4 days, pulling 6 three-gang 10" plows. All this with an upkeep cost of less than $200 since he bought this machine.

"The Caterpillar is the only practical farm tractor built today," is the way Mr. Schmeiser sums it up.

The Weather Bureau Working for the Farmer

A Few Items of Interest Regarding the U. S. Weather Bureau and Its Work in California. It is Believed that the Recent Visit of Chief Marvin Will Result in Better Service for California

WE recently referred to the visit of chief of the weather bureau of the federal department of agriculture, Dr. Charles F. Marvin, calling special attention to the fact that in Southern California is a little strip of the citrus belt where information furnished by the weather bureau probably saves more property than in any similar agricultural area in the world. Our readers may be interested in knowing of some of the activities of the bureau. For instance, take one particular local office, that at Los Angeles. In this office there are an even dozen divisions of work. In these are included frost forecasts, rainfall forecasts and general information of interest to the citrus field. This field calls for special study because its requirements are so different from most other lines of work taken up by the bureau. Then there are intensive investigations and data supplied in the field of general agriculture. Floods and conservation are studied, marine shipping is given storm warnings and information as to winds, etc., railroads likewise are given much data. There is school instruction, testimony given in courts, and, perhaps newest of all, is the special division work for the benefit of the moving picture industry, which is becoming a great factor in California.

But regarding the work of this great bureau in California we may summarize:

There are 11 regular stations maintained for the collection of data, with 32 commissioned employees, 23 special meteorological stations, with 23 paid employees; 380 cooperative meteorological stations, 55 mountain snowfall stations with 42 paid and 13 cooperative employees, 42 river and rainfall stations with 42 paid employees.

There are 81 stations distributing daily forecasts and special warnings, 67 distributing special warnings only (frost, cold wave, rain), 15 stations distributing daily forecast cards, 944 forecast cards being distributed daily.

DR. CHARLES F. MARVIN, CHIEF OF THE U. S. WEATHER BUREAU

Of storm warning display stations there are six regular weather bureau stations, three paid and 18 cooperative display stations.

Daily weather maps are issued at five regular stations in California, with an aggregate output of 1578 copies daily.

Another feature of the work which will be of special value for the next few months is the fire wind forecasts, issued whenever the conditions indicate the occurrence of high and hot winds in the forest districts. These are given to the district forester at San Francisco for distribution to the forest rangers.

Regular weather bureau stations in California are located at Eureka, Fresno, Los Angeles, Mount Tamalpais (branch of San Francisco station), Point Reyes Light (branch of San Francisco station), Red Bluff, Sacramento, San Diego, San Francisco, San Jose, San Luis Obispo.

The work in this state costs the bureau in excess of $70,000. Perhaps the greatest item of expense connected with the entire bureau is that of telegraphing, which costs in excess of $275,000 annually for wires. One feature which may be of interest is that at eight o'clock, morning and evening, Washington time, circuits are formed in various sections of the country in which wires of the Western Union are absolutely at the service of the bureau. This brings every section of the United States in touch with the central office at Washington, it in turn giving information to every division which aids in issuing weather forecasts.

During Dr. Marvin's visit to California he was shown through various agricultural districts and was given an idea of the magnitude of the citrus industry especially. We believe his visit to the Coast will mean greatly increased efficiency of the bureau in its work for agriculture.

AT DEVIL'S GATE IN THE ARROYO SECO

Captain Leeds tracing on map and showing to Dr. Marvin the opportunity for a great reservoir or inland lake above Los Angeles and Pasadena. The picture below shows Dr. Carpenter, local forecaster at Los Angeles, taking photograph of Devil's Gate Bridge.

Potash Production in Southern California

By James T. Armstrong, F. C. S., Etc., from an Address Delivered Before the Southern California Academy of Sciences

THE methods and possibilities connected with the utilization of the different forms of giant sea-weed, commonly known as kelp, have been so largely talked and written about that it might be thought by some people, what more is there to say upon the subject? The prospects of the utilization of sea-weed being so favorable, it is worth investigating the conditions of the industry, for it is our experience that many improvements could be effected.

Michael Faraday, the great scientist, once said that he always believed a fact, but cross-examined an assertion. We have been careful in stating only actual facts, which have been proved to be such by results obtained in practice in the industry.

There is no doubt that the European war has been the direct result of bringing this matter before the notice of investors and others, but although the returns in the manufacture of potash from kelp are remunerative, we would warn those with only a superficial knowledge of it to be careful as to how they invest capital in this industry.

It is stated that boots are being made from sea-weed in Japan and silk in France, and there is no doubt a fabulous amount of gold and silver contained in the 300,000,000 cubic miles of ocean, yet we advise investors not to take much notice of this (although it may or it may not be true), but it is a fact that in the United States we are neglecting a very valuable asset by not making use of the large quantities of profitable sea-weed near our doors.

Whilst we would caution the investing public of the boots and silk part of the business, we must not lose sight of the fact that in Scotland, Ireland, France, Norway, Japan and South Australia there is much money made in this product. The Japanese employ over 600,000 persons in the industry, and China consumes $600,000 worth of gelatinous articles made from sea-weed each year, whilst this country imports more than $15,000,000 worth of products that can be obtained here from kelp.

There have been formed in this country in the past three years several companies with the avowed purpose of manufacturing potash from kelp, and among other reasons for the industry not having been established on a large scale is that those undertaking it have not had the necessary scientific knowledge and practical experience.

In the last 25 years the increase in the sale of iodine has been as much as 57 per cent, and all indications point to a continued growth in the demand. Only a small portion of this product is now being obtained from kelp and the amount can profitably be largely increased.

The manufacture of the different products from sea-weed is still in its infancy, and those that are first in the field will of course reap the benefit. The use of everything pertaining to kelp is daily on the increase. In one district of Scotland (so the Blue Book of the board of agriculture says) "from 1905 there was a marked improvement, and during the four years, 1907 to 1911, the average amounts per annum paid to the workers had risen and had become more than two and one-half times as great as during the ten years from 1884 to 1893." The industry is increasing and during the present year a record quantity of kelp has been manufactured.

The development of the industry in other countries is given at some length by Mr. Armstrong. Also extended reference is made to requirements of various crops. Regarding further supply for this country:

* * *

It is difficult to emphasize enough what a great role nature plays in the storing up in kelp of just those ingred-

THE OLIVE INDUSTRY

FROM the thesis of Mr. A. L. Chaffin, of the University of California, class of 1915, written at the time of securing his degree, we make short quotations showing his estimates of costs, and hopes for the future of the olive industry in California. At this moment the olive grower is hoping that the next year's market will be vastly superior to last year's, which left most growers with the red ink on the ledger altogether too prominent. However, Mr. Chafin is most hopeful.

* * *

The total acreage of bearing orchards in the state is about 15,806, yielding about 27,500 tons of fruit. Olive growers claim that a yield of from one and a half to two tons per acre is a very good average. Also circular No. 121 of the agricultural experiment station of the University of California gives one and one-half tons yield per acre as a reasonable estimate. Olive packers state that about 40 per cent of the fruit produced in 1914 was made into pickles and that the total production was estimated at about 27,500 tons. Nearly half of the pickles are consumed in California. Then if we can educate the other people in the United States to consume as many in proportion as do the people of California there will be a demand for over 120,000 tons of ripe olives yearly in the United States 20 years hence. If the prices go down the consumption will increase, so it does not seem probable that the olive producer will have trouble in finding a market.

The producer has an opportunity to build up a large demand for olives in Canada, for Canada cannot grow olives, and the industry has made but a feeble start in Australia. There seems to be no reason why California cannot produce olives as cheaply as Australia for labor is as scarce and wages as high there as here. Many other new industries are being built up in Australia which are more promising than the olive and this industry is receiving but little attention.

Cost of Production

It has been estimated that, exclusive of fertilization, the care of a bearing orchard, in which is included plowing, cultivating, harrowing, irrigating, slight pruning, etc., would cost from $35 to $40 per acre. Fertilizing should be considered an added investment. The amount spent would depend of course on what one thinks the orchard will show in return. This would probably vary from $10 to $50 per acre, depending upon the soil. It must be remembered that olives for pickling must be of large size, the larger the higher prices they bring. The olives are graded at the packing house, the large ones used for pickles, while the small ones are crushed for oil and only bring $40 to $50 per ton. One can readily see that it does not pay to grow olives unless they are of a variety and size suitable for pickling, and this is why it is necessary to irrigate, prune, fertilize, etc.

Cost of caring for an orchard, $40.00 per acre.

Cost of harvesting 1½ tons of fruit, $30.00 per acre.

Cost of fertilizing, $25.00 per acre.

Totat cost, $95.00 per acre.

After making a study of the olive industry of the world everything seems to be in favor of a promising industry. European countries can produce oil and green pickles more cheaply than can we, but in the production of ripe olives for pickles we seem to have the advantage. Although Europe produces such enormous quantities yet the home demand for olives under normal conditions is almost as great as in America, and these countries do not have much trouble in marketing their first class products. European countries produce inferior olives on a whole to those produced in California, and it is a question whether they can produce a grade of pickles that will sell in American markets and compete with California products. At the present time they do not seem to be able to compete. However, we must always keep in mind that there is a possibility of foreign competition in pickled olives the same as in oil, so we should try to produce more and better olives per acre than Europe and put up a product of such high quality that it will bring the best prices. The demand for pickled olives is almost sure to increase as fast as the production in the United States, and it seems that the olive business has the brightest future of any agricultural industry in the state.

Some Things the Grower Should Bear in Mind

A word of caution to the grower and prospective planter of olives. If one intends to plant olives, first study the climatic conditions, i. e., early autumn frosts, dry, hot wind when the fruit is ripening. Be sure the climate is warm enough to ripen the olives at the proper season. Study the soil conditions. Is it deep, fertile, well drained, and does it contain sufficient lime and potash? Is irrigation water obtainable? If not, but few olives of pickling sizes can be produced.

Still another point the present grower and prospective planter should remember, that is the consumption of olives must increase with the increased production. In order to bring this about the producer must build up his market. This is a big problem in itself, but by cooperation among the growers, setting aside a certain sum yearly for advertising and teaching the Eastern people to eat ripe, pickled olives, the growers can build up a great market. Outside of California perhaps less than one per cent of the people in the United States have ever tasted a ripe pickled olive. Let every grower remember it is to his individual interest to aid in educating the people to consume ripe pickled olives. The producer is not only helping to build up a great industry in California and improve his own interests, but he is also teaching the people to use a delicious fruit which is easily digested, rich in oil and altogether healthful.

MAKING LIME-SULPHUR CONCENTRATE

Investigations for the purpose of encouraging orchardists in the preparation of lime-sulphur concentrates for their own use or in the neighborhood have led to the wide use of this spray material, says the United States Department of Agriculture Bulletin No. 197, "Home-made Lime-Sulphur Concentrate." It is of relatively little importance, except for economy in storage space, how dense or heavy a concentrated solution is made, because it can be readily diluted in conformity with the purpose for which it is to be used. To do this a Baume hydrometer is used, the stem of which has a graduated scale. When the hydrometer is introduced into the concentrated lime-sulphur it sinks to varying depths according to the density of the liquid. In the experiments conducted it was found the Baume hydrometer should register 33 to 34 degrees in the highly concentrated solution, as later here described. A great variation in density, from 25 to 31 degrees, of the ordinary home-made product was recorded in the experiments, where the usual 50-100-50 formula was used. The amount of sediment left from the lime and sulphur varied widely, 35 to 50 per cent.

Making on Small Scale

One of the home-made cooking plants used in the experiments consisted of a twelve-horsepower boiler from which steam was conducted into two fifty-gallon barrels. No coils were used in the bottoms of the barrels, the steam being emitted through the open end of a straight pipe extending with-

in a few inches of the bottom of the barrel. Small batches of the 50-100-50 formula, amounting to 25 gallons of the finished product, were cooked at a time. About 20 gallons of water were put into the barrel, the steam turned on and the water brought to the boiling point. The lime was then put in and after it had begun to slake the sulphur was added. The mixture was stirred thoroughly throughout the time of cooking, which lasted an hour. It was allowed to settle about 12 hours and then the clear solution was siphoned off. The sludge or sediment was put into a cider press and the clear solution pressed out, using ten-ounce canvas cloth for filter. In these experiments commercial ground sulphur and a good grade of lime was used.

The 50-100-50 formula, meaning 50 pounds of lime, 100 pounds of sulphur and water to make 50 gallons of the concentrated solution, has generally been recommended for the preparation of home-boiled concentrated lime-sulphur solution. A good grade of fresh limestone, containing not less than 90 per cent calcium oxide, is necessary for the best results. Hydrated lime is sometimes used, but it is necessary to obtain a good grade and at least 20 per cent more of this form of lime, as it contains a high percentage of moisture.

Highly Concentrated Solution

A highly concentrated solution may be made by using the lime and sulphur at the ratio of one to two, but with reduced quantities of water. The formula used in some of the commercial lime-sulphur manufacturing plants is 80 pounds of fresh stone-lime, 160 pounds of commercial ground sulphur and water to make 50 gallons of the finished product. Solutions prepared by this formula should test on an average 33 to 34 degrees Baume, as explained above, and there is about 50 per cent in volume of sludge after allowing the solution to settle for 24 hours. There is only about five per cent to ten per cent in volume of insoluble materials.

Commercial ground sulphur may be purchased in carlots for about $1.50 per 100 pounds, and lime at about 60 cents per barrel, making the cost of the highly concentrated solution, estimating labor and fuel at 70 cents, about $3.30 per barrel of 50 gallons. This does not include wear on outfit and cost of containers for storing.

At the prices of the ingredients mentioned above, the high test concentrate would cost about 98 cents more per barrel than the low test concentrate made by the 50-100-50 formula.

IRON AND ALUMINUM PHOSPHATES

Written for the California Cultivator
By Gordon Surr

Iron and aluminum phosphates have long been generally regarded as relatively insoluble and the following, therefore, will doubtless be news to many. The paragraphs quoted are from the report of the director, Dr. H. L. Russell of the Wisconsin agricultural experiment station, published in June, 1914:

"Mr. Truog of the soils department has continued his studies on the availability of different phosphates for some of the most important agricultural crops. In his experiments ten different kinds of plants were grown under green house conditions with the sole source of phosphorus as acid phosphate, rock phosphate, precipitated calcium phosphate, aluminum phosphate, iron phosphate (both ferric and ferrous forms), magnesium phosphate or manganese phosphate. These plants showed striking differences in their ability to secure and use phosphorus from these various sources.

"Contrary to the general belief that aluminum and iron phosphates are relatively unavailable to plants, nine of the ten plants tested made better growth on aluminum phosphate than on calcium phosphate, and six better growth on iron (ferric) phosphate.

"Although various chemical solvents have long been employed in an attempt to measure the availability of phosphate fertilizers, the wide differences in the power of individual species to utilize phosphorus in various forms show the inadequacy of chemical solvents in measuring the availability of different phosphates."

In the light of increasing knowledge many ideas formerly held must be discarded, and all engaged directly or indirectly in agricultural pursuits should realize the utmost importance of keeping their minds, so to speak, open, instead of firmly clinging to notions as baseless as the fabric of a vision.

INDEPENDENTS ORGANIZING.

Dr. J. W. Hunter Emery, chairman of the recent meeting of orange growers at Porterville at which time a movement was started to organize all the growers into a cooperative selling organization, has announced the appointment of the following committee who will explain the proposed plan to their neighbors; Dr. S. A. Barber, C. E. Perkins, C. E. Lewis, Burt Cole and Wm. Shry. Dr. Emery is ex-officio member of the committee.

In discussing the matter this morning Dr. Emery said that the proposed plan had been explained to several orange growers and not a single one had objected to it. Instead all the reports so far have been quite favorable.

It is worthy of note that a movement similar to the one here is now under way in Southern California.—Visalia Delta.

USE OF WATER.

"Use of Water in Irrigation," by Samuel Fortier, Chief of Irrigation Investigations, United States department of agriculture, published by McGraw-Hill Book Company, New York, at $2.00.

"It is well to recognize at the outset that irrigation is a many-sided subject. The heavy drafts which it makes on scanty water supplies and the close relationship which it bears to other uses of water call for wise legislation and efficient control on the part of state governments in the granting and protection of water rights and the equitable distribution of water supplies. These comprise the legal and administrative features of irrigation. Again, enormous quantities of water have to be annually stored in the mountains, pumped from wells, diverted from torrential streams, conveyed around hills and across valleys and finally delivered to farmers. The accomplishment of so great a task calls for high ability and broad experience on the part of engineers in designing and constructing the needed works, and these constitute the engineering side of irrigation. Then there is the agricultural side of irrigation which transcends all others in importance in that it deals with the production of profitable crops. All other phases of irrigation are but means to an end."

The above is from the first paragraph of the preface. The book has 266 pages, six chapters touching upon the irrigated farm, necessary equipment and structures, methods of preparing land and applying water, waste, measurement, delivery and duty of water and the irrigation of staple crops. It is an excellent addition to an irrigator's library.

A BOTHERED ECONOMIST.

"Are you worried about the cotton crop?"

"Not just at this minute," answered Colonel Stillwell. "With prohibition assured and spring lamb too dear for me to eat it, the overproduction of mint is giving me all the worry I can attend to."—Washington Star.

John Deere Implements

Van Brunt Single Disc Grain Drills

Van Brunt Drills plant any small seed from alfalfa to bearded oats, corn and peas exactly where it will bring the best results—at the bottom of furrows of uniform depth. All the grain is up and ready for harvest at the same time.

No seed is wasted, all the field sown. Van Brunt Drills have an adjustable gate force feed which compels an even, continuous flow of seed from each seed cup without bunching or cracking the seed. It cannot choke up.

The seed is planted at uniform depth. It beats the dirt. Individually adjustable pressure springs can be made to force discs to cut furrows even depth. Seed is conducted from hopper to furrow opener by metal tubes and there protected from dirt until it reaches bottom of furrow.

The "Light Draft Drills"

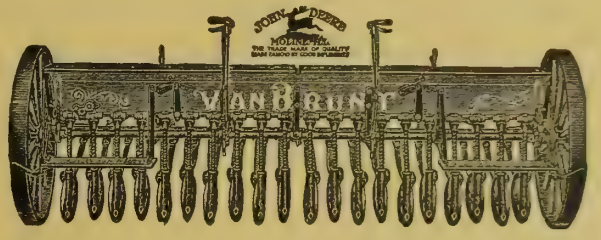
Van Brunt Drills are so called because they are light weight, well balanced and yet so strong that they work entirely satisfactorily under difficult conditions.

No stub axles are used—none required. Simplified construction makes Van Brunt Drills easier to operate.

Main axles are continuous. Drills are gear driven direct from axle. Each wheel drives half the feeds, insuring smooth running.

Hopper is extra large, well braced and has tight fitting two-piece covers. It does not sag.

Disc bearings guaranteed. They will last lifetime of drill. Disc blades are high grade steel kept absolutely clean by spring steel scrapers.



Grass seeder attachment can be furnished for any Van Brunt Drill. It will sow broadcast or drill, as desired.

Write for free booklet "John Deere-Van Brunt Single Disc Drills." It explains why you will get the biggest yield by using Van Brunt Drills.

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X-111

LEMON LAND

Here's your opportunity to buy real choice Lemon Land, in the highly favored Whittier-La Habra citrus belt. This fine rich land adjoins the famous Leffingwell Grove, that in 1913—the year of the big freeze—yielded a lemon crop of over $500 net profit per acre. This was in 1913, the test that distinguished the real from the so-called Lemon Land.

Why take chances with far out, exposed lands, when you can get your choice of the cream of sheltered lemon lands at the opening price of $500 per acre (net acreage) with ample water, delivered to highest corner on each tract.

Leffingwell Heights lies in a beautiful valley, sheltered against harsh winds, by the Puente Hills. Only 16 miles to Seventh and Broadway, the heart of Los Angeles, via Whittier Boulevard, Pacific Electric or main line Santa Fe Railway.

Here's YOUR opening to break away from your limited and uncertain income. Get five or ten acres of this choice land now at the opening price. Have it set to lemons, avocados or valencia oranges and get a good income for life.

Automobile excursions every morning at ten o'clock. Write, phone or call and make reservations.

Deciduous Fruits

BUDDING FRUIT TREES.

THE most important reason for which budding and grafting are practiced is perhaps the fact that most of our fruits do not come true to type from seed, and will not grow readily from cuttings. Also many trees have poor root systems and are not adapted to the existing soil and climatic conditions. This can sometimes be remedied by grafting onto other stock which is of more hardy character. For example plum trees on peach roots grow better in sandy soil than when on plum roots, and the peach does better in heavy soil when growing on plum roots.

Budding is the operation of removing a bud from one plant and placing it upon another in such a manner that it will continue to grow. No amount of skill will make it grow unless the two plants are more or less closely related. The stone fruits: peach, plum, cherry, and apricot, may be successfully budded upon each other. This is also true of the pome fruits: apple, pear and quince, or any other similar group of plants. A stone fruit cannot be successfully budded upon a pome fruit, or a pome fruit upon a stone fruit. An apple bud on apple stock is more apt to grow than if placed on either pear or quince stock, and the corresponding relation holds true with all other groups of plants. The more closely related the plants, the more successful will be the operation.

The operation can be performed in either the spring or late summer. If one desires to bud in the spring the twigs from which the buds are to be taken should be cut in early winter and stored in moist sand in a cool place until growth has started in the trees. They should be of good healthy growth and from one-fourth to one-half of an inch in diameter. The tree is in proper condition for spring budding as soon as the buds have started growth and the bark slips readily.

Summer budding is performed only after the new buds and branches have become well developed. Only those buds near the base of the shoot, which have formed in the early part of the season, and which are more fully matured are used. At the station the best results from fall budding have obtained from August 1 to August 15. Buds set at this time may grow several inches before cold weather. A few buds of many that were set on August 5, 1910 on pear stock made a growth from four to eight inches, that same season.

For spring work buds which have formed the preceding summer, and for fall work buds which have formed earlier in the same growing season, should be used. They will also grow best when placed upon the corresponding season's growth, although they may be placed upon older wood. If an old tree is to be budded it should be heavily pruned in the winter. The following spring a number of new growths will start from the trunk and branches. Of these the desirable ones can be budded that fall, or can with most plants be left until the following spring. Spring budding can be practiced on the apple and trees of similar character which do not bear fruit buds on the current season's growth. In the stone fruits, however, fruit buds are borne on the current growth, that is fruit buds form in the fall on the wood which formed in the summer months. For this reason budding on fruits of this character is always better in the fall.

A sharp thin-bladed knife of good metal should be used. Special knives with a curved cutting edge at the end can be obtained from the seedmen or supply houses. In seedlings the bud should be placed about six inches from the surface to remove it somewhat from the excessive heat near the surface caused by the reflection of the sun's rays. It is often set on the north side of the tree as this side is least exposed to the sunlight and drying. The wound to receive the bud is made by two incisions in the form of a T. The first cut is made with the grain of the wood, about 1½ inches in length. The second one is made across the grain of the wood at the top of the first one with a rocking motion of the knife. The corners of the bark are then loosened with the blade of the knife and the stock is ready for the bud. The bud is cut from the twig with a shield-shaped piece of bark about an inch in length and one-fourth of an inch in width. Hold the twig with the base from you and starting about half an inch below the bud cut towards you. The cut will be from one-sixteenth to one-eighth of an inch at its deepest point, which is directly beneath the bud. A portion of the wood is removed with the bud. Now insert the bud, pushing it well down into the cut. No portion of the piece to which the bud is attached should be left projecting beyond the cleft, and the lips of the bark should fit snugly around the bud itself. Buds always occur just above a leaf. If, however, the leaf is cut off with the knife, leaving a portion of the leaf stalk, the stub will serve as a handle to the bud and aid materially in placing it. Be sure that the bud points up as it may not grow if not placed correctly.

The bud should now be wrapped firmly in place. No wax is needed. A piece of raffia about 12 inches in length is the best material for wrapping. This protects the bud as well as holds it firmly in place. Do not wrap over the bud itself but above and below it. If raffia is not available, any soft cord or cloth may be used. In from two to three weeks the bud should have united and the tying material should then be removed as if left longer it will constrict the stem and perhaps strangle the bud. If the operation has been successful the branch should be cut off half an inch or so above the bud to force the growth to the bud.

On large trees budding is seldom practiced for commercial purposes. Such short lived and early bearing trees as the peach are generally replaced if undesirable. Trees on which top-working is advantageous are as a rule grafted instead of budded.—E. H. Divelbiss, New Mexico College of Agriculture.

TREES IN COLD STORAGE.

At Chico there is maintained what is known as the United States Plant Introduction Gardens. A part of the work of this institution is to send trees to Eastern points for planting. Cold storage is a necessity in this connection for the reason that the natural growth must be retarded until the earth in the colder Eastern climate is ready to receive the trees. It has been found that a temperature of about 35 degrees is best maintained to keep the growth dormant. It is stated that about 50,000 trees and other kinds of plant growth have been shipped this season and that a much larger quantity is expected to be put out next season.—Cold of Calcium, New York.

POTASH PRODUCTION

(Continued from Page 675)

ients which are an absolute necessity to the needs of man and which otherwise we could only obtain by concentrating vast amounts of sea water which would be entirely unprofitable.

The giant kelp of the Pacific Coast does naturally absorb and store within its cells from the sea water the minute traces of the salts we have already named.

Nature, so certain and prolific in its chemical laboratory, provides so for the needs of men that, instead of having to evaporate millions of tons of water to obtain those chemical prod-

The bean land of Orange County has all been planted.

ucts, she does the work for us by storing in these plants in a concentrated form what can, when they are gathered, be economically recovered by simple and perfect processes. It is astonishing that up to the present moment these valuable products, which nature has so prolifically accumulated for us, have not been more fully exploited.

While nature has been so prolific it must be understood that many technical difficulties have had to be overcome before arriving at the present satisfactory stage of the industry. One of these difficulties arises from the fact that large and bulky amounts of kelp have to be handled. This is on account of its high content of water (85 per cent) which has to be disposed of.

Many devices have been tried for drying kelp, but all of these have been failures, because the potash salts, whenever it reaches a certain stage of dryness, effloresces in a nearly chemically pure condition, and, when handled, between 30 and 40 per cent of these salts is lost. Therefore the drying has to be done in a special manner artifically and this part of the process is of utmost importance.

An average chemical analysis of the giant kelp of the Pacific Coast is interesting and is as follows: Potassium chloride, 3.8885 per cent; potassium sulphate, 0.504 per cent; iodine, 0.280 per cent; other salts, 1.344 per cent.

* * *

Summarizing his findings, Mr. Armstrong concludes:

Kelp has been used in foreign countries for over 200 years for the production of iodine and other materials.

Kelp has been used for fertilizing purposes in England and Scotland many years and is now more than ever extensively used.

Scotland uses today 200,000 tons of kelp annually with good profit.

Japan employs over 600,000 people in the kelp industry.

China consumes about $600,000 of gelatinous substances derived from kelp every year.

The kelp on the Pacific Coast contains five times as much potash as the kelp on the Atlantic and three times as much as the Scottish kelp.

Practically all the potash used in the United States is imported from German mines.

This amounts to about 6,000 tons daily or over 2,000,000 tons per year.

The kelp groves of the Pacific Coast of the United States and Mexico can furnish over 6,000,000 tons of potash per year, which is three times the amount now used and therefore sufficient even for exportation.

The kelp supply is inexhaustible on account of being regenerative, which is not the case with the mines and quarries.

The market for potash is unlimited, not only in the United States, but also in South American states, especially Argentine.

It is impossible at the present time to import potash from foreign countries.

All difficulties in manufacturing potash and potash fertilizer from kelp on a commercial scale have been overcome.

There is a supply of kelp amounting to 270,000 tons and equal to 26,000 tons of potash with a value of $2,500,000 per year in the vicinity of Los Angeles alone.

The question of using kelp as a source of potash is considered one of national importance.

This new industry should be fostered and in every respect supported and protected. Both farmers and industries would then be greatly benefited.

By careful cutting of the plants two crops can be gathered each year, thus doubling the annual output of all products.

The iodine, algin and other by-products recoverable simultaneously with the potash, ammonia and phosphate salts form revenue producers of no small moment; the returns from the first two items more than meeting the entire cost of operation.

There is a ready and profitable market for every pound of fertilizer material produced, and a fair market for all by-products.

A water freight rate to all markets is obtainable.

The operation of a plant by means of the new process now introduced should prove a most profitable investment.

The entire operation involved is of the simplest nature possible to a manufacturer who understands the business scientifically, the degree of risk from loss being nil, while the margin of profit is great.

In conclusion, the necessity of giving this industry every protection and encouragement is shown by the following facts:

There is practically no potash upon the market and neither is there likely to be any for a considerable time, very small parcels have changed hands from time to time at prices 150 per cent and more higher than the pre-war level.

The "American Fertilizer" says, on April 17, 1915, in comparing prices now and before the war: "Kainite is reported at $24.34 against $7.00 in July, 1914; 90 per cent sulphate of potash $114.37 against $48.67 in July, 1914, 80 per cent muriate of potash $109.51 against $145.02 in July, 1914. These figures are ex-ship."

And again the "Chemical Trade Journal" says: "The recent imposition of a veto on the export trade, combined with a scarcity of rolling stock in the inland market, has produced chaos in the industry, as the turnover of the syndicate, which in December, 1914, had again risen so far as to reach the level of the deliveries in the corresponding month of 1913, amounted to the value of only $6,500,000 in January and February as contrasted with $11,750,000 in the equivalent months in 1914. A statement to this effect has just been made by the syndicate which at the same time announces that the cost of production has experienced an exceptional increase and many times it is able to effect delivery only at a large loss. It is added that the syndicate has not yet received any reply to the request addressed to the federal council asking permission to raise the inland prices of potash."

The United States faces in the present demoralization of its potash supplies a larger economic problem than in general is realized. Most persons know that our fertilizer, powder, glass and other industries are much embarrassed by the failure of getting potash for which they have long relied on Germany. There is no relief that we can see after studying the question very thoroughly (except to a very small extent) unless we produce potash from the storehouse of kelp, and the time when we should not be dependent on a foreign country for this increasing important product has arrived, for in reality kelp is a huge raw material supply for the potash of the world, and we should give it every attention because potash is a necessity almost as vital to mankind as wheat.

We talk of the "world a market for the American farmer," but can this be the case we ask without potash?

"The great and enduring lesson of beauty"—that is the most important achievement of the Panama-Pacific International Exposition, and it will result in vast improvement of the cities and towns of California. So declares Professor Eugene Neuhausy. He predicts that the exposition will be far-reaching in its demonstration of the "actual commercial value of artistic assets." He declares the exposition really a city-planning exposition of the first order, and urges application of the great principles displayed there, in the development of every city and town in California.

Extra precautions are being taken by the United States government to prohibit the importation of any cotton, cotton seed or lint which may be contaminated with the dreaded pink boll worm. Fumigation of cotton with hydrocyanic acid gas at the port of entry will probably be required.

New State Lands Now Coming on the Market

GET OUR SPECIAL SERVICE

In Addition to Our Regular Service Until 1916

This Land will be snapped up quickly, as it is going to be sold REGARDLESS OF PRESENT VALUE.

State Land was formerly Government Land. We have lists prepared of State Land in ALL Counties. YOU have heard of others getting bargains. YOUR turn NOW.

Do you want land in Bay Counties? In the Valley, Coast, or foothill Counties? It is to your interest to order AT ONCE. Rather than a day later.

JUST NOW it is to your advantage to send $5.00 for lists of State Land in any 1 to 3 Counties, in California.

COUNTY SECTIONAL MAPS showing vacant GOVERNMENT LAND plainly marked; helpful in finding State Land from lists, $2.50 any County. Land being thrown open in the Sierra National Forest Reserve is also plainly marked differently on our maps of Fresno, Madera, Mariposa Counties.

Send for maps TODAY. It pays us to suit you as we have others. Personal checks taken. We repeat,

IT IS TO YOUR INTEREST

to order today, without further delay. Write us fully with your order. Upon receipt of your order, we will answer your questions and send you lists of State Land and instructions by registered mail.

Order the service NOW. Don't wait. NOW is the time to get the best service—the results of 25 years' work, and benefit of thousands of dollars expense—for small fees.

FREE—Small Blue Booklet, just off press; also map circular. Write JOSEPH CLARK, Manager California State Land Information Bureau, 1511 K St., Sacramento.

Cultivate with a
"Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator

Small Fruits Vegetables

PRINCIPLES OF FERTILIZATION OF VEGETABLES

By L. L. Van Slyke

IN the growing of vegetables or any other crops, the use of fertilizers is not the whole thing. This fact needs to be emphasized at the start, so that it may be kept constantly in mind, even if nothing else is. The belief has been, and still is, too common that the supply of plantfood is the chief or only thing to be considered in the successful growing of vegetables, as well as many other crops. This misleading thought permeates agricultural literature, as is evident from the view so constantly expressed that soil fertility and abundance of plantfood mean the same thing. They do not. Plantfood is only one element of soil fertility and of the successful growth of crops, though, perhaps, we are justified in regarding it often as the most important one, if we can properly say that any one condition of successful crop growth is more important than any other.

The power of any plant to make use of its food to the fullest advantage is influenced by several conditions, a full discussion of which would involve a study of soil fertility, plant nutrition and methods of crop management, furnishing material enough for an encyclopedia, but too much for a brief address.

Now, the use of fertilizers is effective or ineffective in promoting crop growth according to whether certain other conditions are present or not; and, as preliminary to our discussion of the special subject before us, let us briefly state in outline the fundamental conditions that are essential to the most efficient utilization of plantfoods.

First, good seed, referring to variety, vigor or vitality, freedom from presence of other seeds and freedom from disease.

Second, sunshine to furnish warmth and light.

Third, adaptation of crops and varieties to special conditions of soil and climates.

Fourth, sufficient water supply, properly distributed, whether by rain or irrigation.

Fifth, suitable physicial structure of soil, making conditions favorable for the growth of plants, brought about, according to special circumstances, by underdrainage, thorough tillage of proper character and at suitable times, proper rotation of crops, periodical incorporation of organic matter, maintaining supply of calcium carbonate in soil.

Sixth, the presence of beneficial micro-organisms in soil and conditions favorable to their growth, secured when necessary by means of inoculation through treatment with farm manure, use of soil, or special preparation, according to particular circumstances.

Seventh, absence of substances poisonous to plants, including acid compounds.

Assuming that these conditions are satisfactorily adjusted, then crops are able to make efficient use of the plantfood that is within reach of the feeding rootlets. Conditions that are unfavorable in any one respect may easily make it impossible for a crop to utilize the plantfood that lies right at hand ready for use, whether that plantfood occurs naturally in the soil or has been applied in the form of fertilizers. We can see, therefore, that, from a practical point of view, all other conditions are preparatory, and in a sense subordinate, to the one final purpose of enabling the crop to obtain and use its food. When climatic and structural soil conditions are suitable for promoting crop growth, then the primary problem of crop production is crop feeding.

Without going further into detail regarding these preliminary considerations, and assuming that those conditions are present which enable plants to use plantfood efficiently, we will take up our special subject.

Quality, Quantity and Earliness

In the growing of vegetables, two factors are, or should be, kept in mind; quality and quantity. In the case of many crops a third factor may become predominant and that is earliness.

We understand readily enough what is meant by quantity and by earliness, but it may be well to stop a moment to discuss just what we mean by quality in vegetables. The word is used to cover a variety of characteristics which affect, and often determine, the marketable value of a product. These special characteristics are entirely different in different kinds of vegetables. We mention as chief among the important qualities of vegetables the following: Flavor, texture, form, size, color, shipping, and keeping quality. I presume others may suggest themselves to you. As I shall point out later, these qualities may be influenced more or less by the proper use of fertilizers. But first, let us take up these different qualities for a closer consideration.

The one chief edible quality which all vegetables must possess in common is that they be palatable or agreeable to taste and appetizing. Flavor and texture enter largely into the matter of palatability, while all the qualities mentioned above may influence the appetizing property. Often a good test of the high quality of some vegetables is the ability to make one's mouth water at sight or smell, though we must confess that in some cases such a test may be very misleading.

Under flavor we would place taste and smell or a combination of these. The fundamental kinds of taste in vegetables are sweet, sour and bitter. Sweetness as a desirable quality should be prominent in sweet corn, peas, melons, squashes, pumpkins, beets, turnips, etc. It is a desirable quality, though less pronounced, in asparagus, celery, parsnips, carrots, potatoes, etc. We look for acidity in rhubarb, tomatoes, etc. In plants used for salads and greens, a suggestion of bitterness is usually desired. For flavor as shown by the combined senses of taste and smell, we have as pronounced representatives onions, horseradish, cabbage, turnips, cauliflower, Brussels sprouts, celery, etc., in most of which the characteristic flavors are due to the presence of certain sulphur compounds. The next edible quality of importance in most vegetables is what we call texture, which is dependent on tenderness, succulence and crispness, a quality of such obvious fundamental value that we do not need to dwell on it.

Regarding form, size and color in vegetables, these are qualities that appeal to the eye but are of no less marketable value than the edible qualities, provided that the latter are not sacrificed to the former. The notions and whims of consumers are numberless regarding these points and may be well or ill founded. But to discuss these details further would lead us too far from the main purpose of this paper. In regard to shipping and keeping quality we will speak later.

Before dropping this part of our discussion, we must touch briefly upon some of those qualities that are undesirable. We have overdeveloped flavor, as in the case of excessive pungency in some onions, or the strong disagreeable flavor of some celery, unpleasant bitterness in lettuce, over-acidity in tomatoes, entire absence of sweetness in peas, corn, beets, turnips, etc. Then we may have undesirable texture as illustrated in the coarse, tough, fibrous character in case of beets, celery, radishes, lettuce, asparagus, corn, etc.

Generally speaking, the ideal qual-

Panama-Pacific Exposition Night Illumination. View from Main Entrance. The Jewel City is Wonderfully Beautiful at Night.

VISITING THE EXPOSITION

WITH expensive service and a 50-cent admission fee one is inclined to feel that every moment must count when at the exposition, and at first entrance, with the wonderful array of buildings, exhibits and even the freak features on the Zone, one may become bewildered. A quiet look over the entire exposition followed by a bit of thinking will help to start one right and secure more for the money than can be secured by merely rushing from one building to another.

For the agriculturist or for any of us perhaps the first day may be given to a general view of the exposition, walking from one end of the grounds to the other and back again and getting a general idea of the location of the various buildings. Then settle down to study the particular feature in which you have greatest interest. If the interest centers in fruit growing then visit the Palace of Horticulture and don't forget the view across the gardens at its side. Nor are all the horticultural exhibits in the Horticultural Building, for in agriculture, especially in the exhibits made by the United States department of agriculture, there is much to see. The agricultural and horticultural palaces are but a short distance apart, with Education lying between. We do not suppose there is a building or a palace on the grounds which does not contain something to engage and hold the attention of the farmer. For instance, notice the advertisements on this page. Everyone of the firms represented has an exhibit on the grounds. It will be noted that many of these exhibits are in the Palace of Machinery, which is the world's greatest building. It covers nine acres and is one of the most prominent buildings as one enters. Some of our advertisers give explicitly the number of the aisle and where to find their exhibits. Look them up.

More particularly, make yourself known to the attendants. For instance, referring again to the Agricultural Palace the editor of the Cultivator was looking through the wonderfully interesting exhibits of apples in the glass cases in the Palace of Agriculture and finding a number of points upon which he wished information he went at once to the attendant in charge. The work in hand was immediately dropped and every point regarding which information was desired was fully explained. More, it was done in a way which showed a desire to serve, and the exhibit was left with the feeling that a new friend had been found.

In asking regarding exhibits there need be no fear of being importuned to make purchases. It is against the rules of the management to permit soliciting in any way. It is simply a great educational exposition. Make the most of it.

When your valise is packed tear out this page of the Cultivator and put with your guide book so as to secure information regarding where to find the exhibits which are of real value to the farmer.

It will be noted that in the Palace of Machinery the Western Gas Engine people, the Krogh Manufacturing Company, the American Well Works of Aurora, the Luitweiler Pumping Company and the Layne and Bowler Corporation may be found, while in the Palace of Agriculture is the Holt caterpillar and the Arthur F. Steiner milking machine. In the Palace of Horticulture the Bean Spray Pump Company, recently burned out, is making a magnificent exhibit. The California Corrugated Culvert Company is making its exhibit in the mines and Metallurgy Building, while the Redwood Manufacturing Company has an exhibit well worth going to see down near the Dairy Building. It speaks for itself as soon as you get near the live stock exhibits.

COMING EVENTS

Friday the 18th is Oregon's day at the exposition. The remainder of this week and the early part of next week will be given over to Greek plays. Sunday the 20th is Epworth League Day, also Elks' Day. Others observing this day are the International Rotary Club, American Historical Association and Pittsburg. The 22nd is Cleveland Day. The Suckers have entire possession on the 24th, which is Illinois Day, also Utah and Cincinnati Day. Fri-

General Agriculture

CALIFORNIA CORN.

IN the matter of production of corn California is one of the leading states of the Union when considered from the yield per acre. In total acreage, however, we are willing to accept a place near the foot of the line. There are a few who insist on continued corn production, and when we see the results secured we wonder why more do not grow corn in this state. Certainly prices are long. A crop grown in Hemet last year is shown on cover page of this issue. It was grown by Mr. S. C. Miller, who writes:

"I drilled three-fourths of one acre to corn, which had previously been set to apricots in February. The trees had been set 24 feet each way so I drilled five rows of corn between each two rows, leaving a space of about four and one-half feet on each side of the trees.

I planted a corn called the Hickory King and watered and cultivated twice each month. This corn grew to be 14 feet tall and many of the stalks had three well developed ears.

On the fourth of July, 1914 we gathered our first roasting ears and later gathered and sold over 300 dozen ears at 20 and 25 cents per dozen.

The photo which was taken on July 17 shows about one-half the patch in the shock.

Corn can be successfully raised with plenty of water in the Hemet Valley. I have demonstrated that two crops can be raised on the same ground in one year.

For the first crop I would plant as early as the 15th of March, planting in deep furrows made with a single shovel plow. It should be cultivated once a week and irrigated every ten days, especially in the latter part of the season. My second crop was planted on the 25th of July and matured a good yield.

(See Photo on Cover)

CUTWORM CONTROL

Cutworms are the naked, greenish or dusky larvae of a number of species of dusky-winged moths that fly at night for the most part. In the spring of 1914 there was a great number of one species of moth of this group prevalent generally over New Mexico.

The usual life history is as follows: The eggs laid by the moths in late summer hatch into small caterpillars, or "cutworms," which lie concealed just beneath the surface of the ground near tender parts of plants. They feed mostly at night. Later cold weather and lack of food necessitate hibernation in the soil or under rubbish, weed piles, etc. In the spring, feeding is resumed again. The damage is more noticeable at that time for the cutworms are fair sized, hungry, and vegetation is scarce. After a time the caterpillars reach their full size, go into the soil to pupate, and later emerge as moths to lay more eggs for later generations. Alfalfa fields harbor enormous numbers of these cutworms.

Control.

Many moths may be caught at night by placing a light above a tub of water. This will not reduced the number of cutworms much as the females do not fly far before laying the eggs. It will reduce the nuisance of having the moths in such numbers about the house. Water standing six or eight hours on an irrigated field should kill many of the cutworms in the soil. A reliable remedy is the poisoned bait made as follows: Mix one pound of Paris green with 25 pounds of dry bran. Add two or three quarts of molasses to five or six gallons of water and stir the mixture thoroughly into the poisoned bran. Let this stand for several hours before using. In infested fields scatter broadcast, in the evening, pieces of this bait the size of two or three fingers together. In gardens, strew the pieces along the bases of the plants being attacked. In this dry climate the application may have to be repeated to give best results.—D. E. Merrill, Entomologist, New Mexico College of Agriculture.

BEET SUGAR VS. CANE SUGAR

The view is frequently held by housewives that it is impossible to make jelly with beet sugar and that cane sugar is necessary for this purpose. The very general extent of this idea is indicated by the action of at least one of the large mail order houses of the country in appealing to the popular prejudice by advertising that it sells only cane sugar.

That such a view is incorrect is evident from the fact that beet sugar and cane sugar are the same identical substance, known to the chemist as sucrose, one being extracted from the sugar beet, the other from the sugar cane. Any difference between beet and cane sugars would thus, of necessity, be due to the different character of impurities contaminating the sucrose from the two sources. However, properly refined granulated sugar, whether derived from the beet or the cane, is one of the purest substances sold on the market, containing at most not more than one or two tenths of one per cent of impurities. It is thus evident that the obection to the use of beet sugar is due rather to misinformation and prejudice than to any inferiority of the sugar.

In this connection it is of interest to note that practically the whole of the sugar used on the European continent is beet sugar. Certainly Europe has not fallen behind the United States in the quality of the jellies and other confections produced—R. M. Isham, Colorado Agricultural College, Fort Collins.

MEDICINAL PLANTS

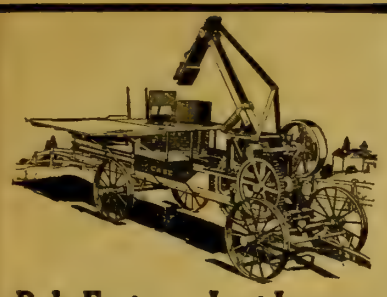
The National Association of Manufacturers of Medical Products is issuing lists of medicinal plants which the association hopes may be produced in this country. Generally, these plants are those which have heretofore been grown in other countries and the raw product shipped to this country for manufacture. It is possible that some of these plants may be produced profitably in this country. Those who may wish to investigate may write to the secretary, C. M. Woodruff, 475 East Grand Boulevard, Detroit.

The department's circular, which gives warning regarding necessity of securing a thorough knowledge of this feature of agriculture, says: "On the other hand, the number of drug plants which may be grown in the United States is large. Many native medicinal plants which are found in their wild state in a few sections have been successfully cultivated in situations far beyond their natural range. In suitable soil and under favorable weather conditions many plants have done well under cultivation in numerous places in the Central and Eastern states and if the difference in climatic conditions is not too great will probably be suitable in other regions: Anise, belladonna, burdock, caraway, catnip, camomile, conium, coriander, digitalis, dill, echinacea, elecampane, fennel, henbane, horehound, pennyroyal, sage, stammonium, tansy, thyme.

The farmers' cooperative creamery is especially valuable for building up a town as well as the surrounding community because it brings heavy deposits to the bank at frequent intervals as well as a check to each patron once a month. This supplies ready cash for the living expenses of the farmer, which in turn makes it possible for the merchants to conduct a cash business.

SOMETIMES HAPPENS.

After a girl gives her hand in marriage she may discover that she put her foot in it.



Bale Faster—Last Longer

Users generally admit that a CASE Baler takes hay faster than they can feed it—and with minimum power. Only 6 to 10 Brake h.p. required to operate. Two Sizes—14 x 18 inches (3½ to 5 tons) and 17 x 22 inches (4 to 6 tons per hour). No other presses are so well made and strong. They outlast the next best by years. Built as carefully as the largest and most expensive CASE Tractors. But their mechanical perfection costs you nothing extra.

CASE
Baling Presses

Simplest to handle. Safest to work with. Can't be choked or jammed. No chance for accident. Operate with 2 less men than others—with CASE Hay Fork attachment.

Case Sweep Power Baler is ideal for home use. 3 men and 2 horses bale up to 2½ tons per hour. Think of that. Start when the hay is ready. Don't wait for the machine crew.

Mail a postcard for new Baling Press Catalog and prices.

Bees and Their Care

CONTROLLING SWARMING

By C. F. Greening

FIRST, I am working for extracted honey principally as there is less work and far more money in it in the long run. Working for comb honey would be rather more difficult. But I also do some of that.

I store my bees with a super of combs on top for winter, or, if not, I add the super as soon as it becomes warm and let the queen deposit some eggs in it until honey flow begins.

When the flow starts I lift up the super and place another under it full of combs. When that is reasonably filled I again lift the top super, placing another set of combs under it, then examine the top super and see if all the brood has hatched, or nearly so. If it has I remove one frame from the center, go to a hive that has frames of brood in super and simply exchange combs, always keeping some brood unhatched in the top super. As long as there is any space below that super in the hive proper your bees will not swarm. My hives I run as high as my head, eight to ten supers, or if short I extract as required, but always leave or have some unfilled frames below the top super that has brood.

That is my method of non-swarming. I have not had a natural swarm in six years, whereas before that my children and grandchildren have had to watch bees for four months of summer. Now I watch no more, but tell the bees "There's the honey. If any swarming is needed I will attend to that. You go for the honey and keep everlastingly at it." They always mind me.

Now for swarming in May, or up to the honey flow, whenever that occurs. We will say you want to double your colonies and no more. As soon as they are good and strong, and some honey coming in, take an empty hive, fill it with frames of comb, if you have them, or part combs and part guide combs, all but one frame near the middle of the hive. Now go to the best colony you have, and select one good frame of brood in several stages, and put it in the space left in the new hive, putting an empty frame where you removed the brood from.

Now take the hive with the frame of brood to a good strong colony, pick up the colony and carry it away to one side, at least 16 feet, and put the hive with frames and comb of brood in the place where the colony stood. Contract the entrance to a couple of inches and let them alone.

This work must be done when a good number of bees are out in the fields; near the middle of the day is best. In a few minutes you have a thousand bees flying around, and they are completely lost. They will run in and out crazy for a while, but soon get to work with a resolution that, "As we have lost our home and mother we have the wherewith to make a new home and brood to rear a new mother." By the end of the second day they will be working like nailers to build up, while the hive you carried away is as still as a graveyard on a Sunday night. Practically all the field workers are at the old stand in the new hive. Now treat them the same as the first part of this article directs, and you have no swarms that year.

By following this plan you have one swarm each of increase, or none as you elect, not as the bees would do if left alone. Follow the above and save colonies, save watching them, save doubling weak ones, save hives, and what is more important when the honey flow comes in all its beauty, you have every field worker at work. They are not crazy over the swarming fever or losing time strung up waiting for a good day, or building combs when they should be lugging in honey, while honey lasts.

Thus we have the bees all busy while honey comes, whereas if allowed to swarm in the middle of the honey flow, see what a loss you have caused by the demoralization of one, two, three, or four swarms from one, and half of them won't get more than enough to winter on.

My colonies were eight stories high last summer; and while my neighbors got 25 to 50 pounds of honey, I ran up to 150, 200, and one colony 235 pounds. You see it was honey I was after.

Build up strong before the honey flow, get the swarming out of the way, and let every able-bodied bee tote in honey.

By my method pou can build up any kind of swarm you wish or any strain of bees, because you select the brood to rear the queen from. They more readily sober down by taking a frame of brood from the hive you remove and placing it in the new hive, because it is a part of the old home and smells the same. They will never desert their brood.—Exchange.

MOODS OF BEES VARY

By J. D. Fooshe, in Gleanings

I note that the smoke method of introducing queens is not always successful. I have read with interest the many claims for this method. I am not surprised to see that after having been tested a year or more it is not always successful. I have no doubt that veteran beekeepers have tried the same plan oftentimes before but decided that it was not always successful.

Bees are the most erratic little creatures in their temperament of any thing I have ever had to do with. When I worked with bees regularly and reared queens daily and was constantly changing queens or introducing queens that came through the mail I had some notable experiences. In the first place bees are so susceptible to climatic influences which create abnormal conditions inside their hive that they are seldom in the same mood, so to speak. Today you may raise the top of a hive and pull out all the frames and not use a particle of smoke; but tomorrow, look out. There might have been an east wind or a slight sprinkle of rain during the night and the same colony that let you handle them the day before without smoke will hardly let you enter the next day without drastic measures; so oftentimes this condition prevails at the time a queen is to be introduced. If in a normal condition, and honey coming in, almost any of the tried methods of introducing will succeed; but if their temperament has been affected, not so.

I have oftentimes used smoke successfully; but having frequently failed with it I stick to the cage plan.

Virgin queens several days old can often be successfully introduced by any of the common plans, provided conditions are right in the hive. I remember away back into the 70's I received by mail a queen that I prized very highly. I introduced her to a strong colony that I knew positively to be queenless, and in a couple of days I was investigating, and found my queen in a ball of bees. I smoked them and released her and put her back in the cage, and this process of recaging and balling went on for a week, and I deliberately got some chloroform and put them all apparently dead on the bottom-board, and turned the queen loose; and when they awoke from their stupor they seemed to be glad to accept her royalty, and she was soon laying. Any queen that has ever been balled, whether virgin or laying, is harder to introduce than if never antagonized, even though she be changed to another queenless colony.

In all my experience I don't know of anything that is so changeable in physical condition as the bee.

NURSERYMEN TO CONVENE

Secretary Tonneson of the Pacific Association of Nurserymen is sending out a call for the 13th annual meeting of the Pacific Coast Association which will be held in San Francisco August 12-13. The executive committee has an interesting program under preparation. A portion of each day will be given to visiting hours at the Panama-Pacific Exposition. The programs and badge books are now being compiled.

MARKETING CANTALOUPES

About the busiest place on earth these days, providing we omit the central part of Europe, is the Imperial Valley. Hundreds, even thousands, of carloads of melons are going to all parts of the East. One hundred cars within the 24 hours was reached about the first of June and the pressure has increased since then. Chicago reports on June 10 receipt of 25 cars in that one day from the Imperial Valley.

The office of markets of the United States department of agriculture is aiding in marketing this immense crop by installing members of its staff at Brawley, and these men are gathering from all the markets of the country the best information as to conditions. In charge of this work for the department is Mr. O. W. Schleussner. Regarding this bureau and its work Mr. Schleussner recently wrote to the Brawley News:

"The work covers not only fruits and vegetables, but all other perishable products, such as dairy products, poultry and meats and farm products, such as hay, grains, cotton, etc. Since its organization the office has been forced to give most of its attention to the staples, especially cotton, but is now in a position to do more work on perishables.

"It has been planned for some time to establish a limited market news service on some of the more perishable products, and this year a start was made with the strawberry crop. Information was gathered with reference to the daily shipments from all of the principal producing points and also as to the market conditions in the large consuming markets. This information was made available by telegram to all those desiring it."

This matter of assisting in the marketing of perishables by securing these returns surely will prove invaluable.

WORKING THE HOG

We do not believe that the 435-foot Tower of Jewels or any other feature of the Panama-Pacific International Exposition has had more attention than an advertising stunt which is scheduled near the live stock end of the grounds. This is a contrivance for feeding hogs, or rather to encourage hogs to feed themselves with grain which they grind themselves. This contrivance has been illustrated in many California papers and we now note it has reached the agricultural papers along the Atlantic Coast. It consists of a metal drum so arranged that the hogs, nosing about for particles of grain, exert a pressure sufficient to revolve it, causing it to grind a number of grains and drop them down within reach of the hogs. This encourages further rooting and more grain. It has often been said that our great packing plants have so utilized their wastes that nothing but the tail and the root at the end of the snout were thrown away. We are now saving both, in other words, making the hogs, to an extent, work their way. It is now suggested that it might be possible to make them also produce enough electricity to light our homes and pump our irrigation water.

MORE LIGHT

We believe the citrus growers have informed themselves as to their own great marketing organization and as to marketing methods in general as never before. Early this season the marketing conditions were extremely unsatisfactory, and without endeavoring to learn as to these unsatisfactory conditions many concluded that the low prices were due to faulty marketing methods, but the majority of the producers, we believe, investigated this question and answered it satisfactorily to themselves. Some are still asking, and we believe by far the greater proportion will answer the question intelligently. Their investigations have generally taken the path of introspection, but a few have looked at the exchange as something apart from the membership. This view is also taken of our national government by many citizens. They look at it as a thing apart from themselves, a great paternal organization ready to do for or care for those who are subject to it. We believe that any such view of government or cooperative organizations is entirely wrong. They are, or should be, a part of ourselves, and are only successful as the individual members are successful in guiding them.

Among those who are looking at the California Fruit Growers' Exchange as an organization apart from themselves is a body of men who are endeavoring to organize "to affiliate for cooperative purposes all growers of citrus fruits in the state of California, north of the Tehachapi mountains.

"The work of this organization shall primarily consist in the securing of detailed information and its classification and permanent record concerning all matters pertaining to the packing and selling of the fruit of its members by the various agencies related to it. And also to handle the system of inspection that is necessary to standardize the product in the matter of maturity, tests, etc."

If any who are within such organizations propose to investigate their own transactions we fail to see the necessity for an outside organization to accomplish it. The way to cooperate is to cooperate and not to create a great number of organizations the weight of whose machinery will break down the whole cooperative effort.

DIVERSIFY

California has been a state of specialists. The great corporations owning Mexican land grants have as a rule turned exclusively to grain, to lima beans, to beef cattle, or some other one product. The orchardist has centered on prunes, Washington navel oranges, Valencias, lemons, raisins, or some other crop adapted to his section. Fortunately, as a state we have diversified. We say "fortunately," for the farmer generally is coming to the conclusion that diversified farming is far safer than specialized farming. Some of the orange growing sections of California were the first to make this determination and today the orange grower is reaching out for other lines which will round out and make less risky his business venture. Cotton growers of the South have refused to take up with diversification and have created the most embarrassing condition for themselves, one which they are unable to fully appreciate. But even in the South diversification is coming.

Some of our most successful orchardists are now combining their orcharding with dairying and hog raising, and the result is greatly enriched soil which means fatter bank accounts. One large orchardist has said: "If I can make my dairy break even with the high prices which I have to pay for hay and feed, nearly all of which is secured from outside the ranch, I consider the profit in the ordinary waste products, the manure, justify me in keeping up the dairy as a adjunct to the orchard." We grant it may not be so pleasing at first sight, but the greater profit, or surety of profit, will at least justify a trial.

In suggesting methods of increasing our feeding capacity the International Harvester Company suggests that instead of organizing more chambers of commerce and boards of trade or organizations which are offering bonuses to secure factories in our communities that we organize chambers of agriculture which shall endeavor to create greater productive power all over our country instead of grabbing business from each other or from other communities. "No country can become richer than its lands. From the soil comes our food and clothing; all other human needs are subordinate to these. Food is the chief material concern of life, its production the most important occupation. In the hard school of experience we are slowly learning the lesson of real business economy, the greatest lesson of all time, that of feeding ourselves. Let us learn that lesson well."

Agricultural Notes

Kentucky hemp is being commercially grown in the San Joqauin Valley of California.

There is a steadily increasing demand in the Philippine Islands for American apples.

Honolulu is now shipping about 50 cases of fresh pineapples weekly to San Francisco and Portland.

Government entomologists are working in the Hawaiian Islands to find a successful means of combating the pink boll worm of cotton.

The Associated Chambers of Commerce of Australia will hold a congress at Brisbane, May, 1916. This year's congress was held at Hobart, Tasmania.

Considerable shipments of Douglas fir railway ties from the Pacific Coast have been made to England. It is stated that one English firm placed an order for 20,000,000 feet.

Olive oil has been included among the products on the embargo list of Italy, but permission to continue shipments to the United States will be granted upon application to the Italian authorities.

Because of the competition of the jitney busses the electric railway, which operates the city and suburban lines in Vancouver and Victoria, has reduced its rates from five cent fares on transfers to three and one-eighth cents or eight tickets for a quarter, without transfers.

Owing to the pronounced rise in price the government of British India has prohibited the exportation of wheat for one year, beginning April 1, 1915. Another order promulgated March 27 restricts during the same period the expotation of wheat flour, shipment being allowed only when a permit from the chief customs officer has been obtained.

The Philippine Agricultural Review refers to the interesting fact that both cane and beets have been made into sugar at the same factory in Arizona. The first crushing of cane was made in the 1913 season at the factory which previously had operated on sugar beets. Many experimental plantings of sugar cane have been made this year in Arizona and California.

Since the war began sales of bananas have been so unsatisfactory in Jamaica that careful experiments have been made in process of making banana flour. Experiments at Kingston have demonstrated that 915 pounds of fruit on the stem will yield flour to a value of $5.60, which is regarded as a good return. The banana meal is being used with wheat flour for bread making. Producers the world over are awake to the necessity of doing all in their power to make themselves independent of buyers and shippers.

Commercial Agent E. G. Babbitt at San Francisco states in United States "Commerce Reports" that several of the largest bakers' supply houses of the United States contemplate erecting factories and drying plants in China to manufacture dried and desicated eggs. One plant has already been established near Hankow and another is to be erected at Shanghai with a branch at Tientsin. It is planned to market the product in one-pound tins, and several grades of eggs will be marketed. Egg imports into the United States during the fiscal year 1914 consisted of $1,089,164 worth of fresh eggs, of which $242,222 came from China and $504,619 of yolks and frozen eggs, of which $53,076 came from China.

Agricultural News Notes of the Pacific Coast

Northern California

Nevada County is increasing its rhubarb industry.

The Gridley Cow Testing Association reports very successful results from testing work.

Late grain was benefited by late rains in the Sacramento Valley and a good crop is assured.

Twenty-five hundred boxes of asparagus are shipped daily from three packing plants in Sacramento.

Late continued rains caused much damage to first crop hay in many districts of the Sacramento Valley.

The new Orland creamery has been receiving so much cream that it has been forced to double its capacity.

A tract of 400 acres north of Marysville is now being put in shape for planting to olives and citrus trees.

The bureau of soils of the United States department of agriculture is at work upon a soil survey of the Russian River Valley.

Pear scab is alarming the growers of the Sacramento Valley. The unusual development of this trouble is ascribed to the cold spring.

Apricots, plums and peaches which usually start moving through Sacramento by the first of June are about ten days later than usual.

Chief Lively, of the department of live stock of the Panama Pacific, has announced the judges for the sheep show to be held in November.

R. P. Cundiff, for 15 years horticultural commissioner of Riverside County, is visiting orange and olive districts of Oroville, Butte County.

Sutter County reports that its cherry crop was very lightly damaged by the rainy weather which so seriously injured the crops in other sections.

Experiments in growing the Sequoia gigantea in Siskiyou County have proved successful. They are being tried out in the Klamath national forest.

There is talk of establishing a cooperative olive packing house at Chico. It is hoped to bring a large number of growers into the enterprise.

The annual cherry carnival of the San Juan Ridge, Nevada County, was held last week. This carnival is usually held in May but owing to the cold spring it came much later this year.

Yuba County claims leadership of the state in cucumber production. Last year 1,000,000 boxes were shipped from the county and indications are that this year's yield will be much larger.

It is announced that the quarantine on live stock shipped into California will be raised on June 30. It is hoped by officials of the live stock department of the Panama Pacific that many animals will be brought in in time for the fall shows.

Many scientists and experts from the United States department of agriculture were in Chico the first of June visiting the plant introduction gardens. They also visited the rice experiment station at Biggs. These gentlemen were in attendance at the cereal conference, their visit taking them through the San Joaquin and Sacramento Valleys.

Central California

Green fruit trains started June 15 from Fresno.

Modesto is organizing a new local of the county farm bureau.

Several successful plantings of hemp have been made along the San Joaquin River.

The Southern Pacific has put on three new fruit trains daily, one starting at Fresno and two at Merced.

The last link in the state highway from Fresno to San Francisco will, it is announced, be completed by July 1.

Farm Adviser Mayhew of Madera County says that deer are proving a pest to the farmers of the mountain districts.

The Kerman Cured Fruit Association held its monthly meeting June 4, at which time important amendments to its by-laws were made.

Directors of the Tulare County Growers' Association have issued a call for a general meeting Saturday, June 19, at the cannery building.

The Armona cannery has contracted for 600 tons of apricots this year, just twice the amount preserved last season. Operations have already begun.

Kings County is expecting a bumper bean crop. The plantings are largely experimental, and tepary beans have been used more than any other variety.

Farm Adviser Roberts of the Santa Fe Railway addressed farmers of the Alta irrigation district on the advisability of securing a county farm adviser for Fresno.

Farmers of Los Banos, Merced County, are organizing a cooperative creamery association. The location of the plant will be decided at the next meeting of directors.

The organization committee of the Lindsay-Strathmore Irrigation District now has more than 8,000 acres signed up and expects to present its petition to the supervisors at the July meeting.

More than 5000 sacks of rice will be harvested in the San Joaquin Valley this year, according to a rice importer of San Francisco. Most of this will be obtained from fields in Kern County.

Work of fumigation against the gray scale of citrus will be started very soon. County outfits will not be used this year as the grove owners have themselves taken up the fumigation work.

The committee of five which is seeking to find a market for the 1914 holdover crop of dried peaches in Fresno County reports that it finds no evidence of unusually large amount of holdover stock. It is nevertheless continuing its activities.

The prune crop of Santa Clara County is estimated at only half of normal. At a meeting held May 15 at which some 300 growers representing all parts of the county were present detailed reports from all sections showed that there could be no change in the previous estimate of only a 50 per cent crop. Growers therefore see no reason why they should accept low prices for their crop.

Southern California

San Fernando held its June festival June 9 and 10.

Eleven carloads of beans were shipped from Saticoy, Ventura County, during May.

The Hemet Farmers' Association held its first picnic on June 12 at Castile Canyon.

Bell peppers are a considerable feature in the crop planting of the Brawley district this year.

It is rumored that a by-products plant is to be established at Arcadia, Los Angeles County.

There will be a large bean crop on the mesa of the Buena Park district this year, mostly of the blackeye variety.

Over 400 people attended the first annual meeting and picnic of the Ventura County farm bureau at Foster Park.

Farmers of San Diego County have organized a winter vegetable union and tentative contracts are being signed up.

Hemet, Riverside County, has promise of its biggest fruit crop. Peaches and apricots constitute the larger portion of the deciduous fruit.

The cantaloupe crop of Imperial County is almost a month late this season and it is estimated that it will be at least 25 per cent short of normal.

J. D. Cleminson of El Monte has been chosen president of the San Gabriel Valley Potato Growers' Association. The organization has about 100 members.

Cantaloupe growers report daily to Government Agent Schleussner at Brawley the number of cars shipped and destination of each. In this way it is hoped to control shipments and not overcrowd any market.

Citrus growers of Covina will visit the experiment station at Riverside June 19, and the following Saturday, June 26, Orange County growers will visit the station. There will be an all-day meeting on both days.

The final details in the transfer of property bought by the state university for the citrus experiment station at Riverside are now being arranged. An architect has in hand the making of plans for the new buildings.

It is estimated that the walnut crop of Southern California will be between 12,000 and 16,000 tons, although it is possible the blight which is now appearing in orchards may materially reduce these figures. Blight has been exceptionally severe.

The Hemet Cured Fruit Association has more than 90 per cent of the ranchers of that vicinity in its membership. There will probably be much drying of fruit this season as the crop is large and the dried fruit can be stored for satisfactory prices.

The U. S. government has sent an expert from the department of agriculture to Brawley, Imperial County, to aid in distribution of the cantaloupe crop. An office has been opened in Brawley which will post daily records of the number of cars shipped together with report of market prices and conditions.

The Coast

Prescott, Arizona, will have a Frontier Days' celebration July 4, 5 and 6.

A new fruit processing plant is to be erected in the Yakima Valley of Washington.

Kansas City live stock buyers are in the Salt River Valley of Arizona buying steers.

Brigham City, Utah, will have a peach day celebration, the date to be announced soon.

Chandler, Arizona, is promised a broom factory if sufficient acreage is planted to broom corn.

Ex-Game Warden Stevenson of Oregon has a flock of wild turkeys on his ranch near Forest Grove.

Texas pecan growers are expecting a large crop although blight is affecting the trees rather seriously.

Cantaloupes and watermelons are being put on the market from fields of the Rio Grande Valley in Texas.

The Bonneville County Grazing Association of Idaho has sold its entire clip of 500,000 pounds of wool at 26½ cents.

Texas farmers are refusing to ship their onions at present prices and are putting them in storage as fast as they can find facilities.

A new beet sugar factory is in contemplation at Spanish Fork, Utah. Canvassers are now in the field securing contracts with growers for acreage.

Some Oregon farmers are objecting to the bounty on coyotes as they say the rabbits are worse on crops and the coyotes if left alone will keep down the rabbit pest.

The management of the Columbia River Interstate Fair, to be held at Vancouver, Washington, September 6-7, has appointed C. A. Watts director of the coming fair.

Dr. Ashley, chief of the milk and dairy inspection division of the health department of Utah, has taken samples of milk to the National Pure Milk Contest held in San Francisco.

The United States department of agriculture has just published a bulletin on date palms which describes in detail the structure of leaves of different varieties as a means of identifying them.

Hundreds of entries have been made for the first annual sheep and ram sale to be held under direction of the National Wool Growers' Association at Salt Lake City, Utah, September 6 and 7.

Governor Withycombe of Oregon has just made announcement of the following appointments of stock inspectors: Charles Wendt, Baker County; T. B. Johnson, Union County; Henry Haas, Wallowa County; A. W. Rugg, Umatilla County; M. D. Kelly, Malheur County, and Gerry Snow, Multnomah County.

Members of the joint commission representing the United States reclamation bureau and the appropriations committee of congress are now on their tour of inspection of 35 reclamation projects under consideration by the government which, if carried out, will bring water to over 6,000,000 acres of land.

There is a Difference
between the
Ideal Green Feed Silo
and
Other Silos

IT DOESN'T TAKE AN EXPERT to tell the difference between an Ideal Green Feed Silo and some others.
ON THE CONTRARY, it is an easy matter if the prospective purchaser will remember that a silo to be of any value whatever must be "air and water-tight" and capable of producing as good ensilage from every pound of good feed put into it.
IF HE WILL THEN TAKE FIVE MINUTES to compare
The detail of construction,
The quality of material and workmanship,
The contact of the doors with the door frame,
The kind and size of hoops and lugs used,
The quality of the paint for the inside,
The type of roof and whether or not it is fitted with a galvanized ventilator,
What provision, if any, is made for keeping the silo round and preventing its collapsing,
In fact, everything that enters into the design and construction of a silo that will make it a thoroughly practical piece of equipment,
He will then see the difference.

THE MAN WHO TAKES even the first step indicated in seeing for himself the difference between the Ideal Green Feed Silo and others does not put his money into any other one time in a thousand.

THE COMPARATIVELY FEW BUYERS of other silos are those who merely read printed claims or listen to the argument of some self-styled "adviser", who is probably working for a commission only, and whose only purpose is primarily to sell a bill of lumber.

THE WISE BUYER OF A SILO today does see the difference when buying his first silo, while the unwise or careless one usually finds that his presumed saving in first cost actually means a loss to him in spoiled feed and represents the difference between success and failure in the use of a silo.

OUR PURPOSE in selling a silo is to develop the dairy and stock-raising industry on a more substantial basis than heretofore, and in order to do this we must supply a silo that is a thoroughly practical piece of equipment.

THAT IS THE REASON WHY four buyers out of five are buying Ideal Green Feed Silos and why the use of the Ideal Green Feed Silo will before long be as nearly universal on the Pacific Coast ranch as they are in the eastern states and in Canada.

BUTTER MAKING ON THE FARM.

THE flavor and aroma of butter depend very largely on the ripening of the cream. Ripening of cream also improves the churnability of the cream and increases the keeping quality of the butter. Ripening means souring or preparing the cream for churning. It is brought about by the development of lactic acid which is a by-product resulting from the growth of certain species of bacteria, commonly called lactic acid bacteria. These bacteria are normal to milk and cream and their presence is necessary for the development of desirable flavors in butter.

Ripening Temperature

The temperature at which cream ripens best is between 60 and 70 degrees Fahrenheit. A lower temperature than this will produce a bitter cream, while higher temperatures are likely to produce foul flavors.

Starters

It is a common practice among farmers to use a little buttermilk from one churning as a starter for the next batch of cream. This is the easiest way of providing a starter, and if the buttermilk is good it is very satisfactory. However, if one is having trouble with poor flavors and difficult churning a more satisfactory starter is to save four or five bottles of clean milk and allow them to sour naturally, at 60 to 70 degrees Fahrenheit until firmly coagulated. Then taste the contents of each bottle and use that which has the cleanest and pleasantest acid flavor for a mother starter. By adding this starter to a larger amount of milk enough can be made to sour any amount of cream. A starter is simply a quantity of milk containing a preponderance of desirable germs. It should be added to cream at the rate of three to ten percent of the cream at least 12 hours before churning.

Precautions

Stir cream frequently to insure even ripening and to prevent the curd from settling to the bottom and becoming lumpy. Do not add fresh warm cream to the older cream. Let it cool first. Sweet cream should not be added to sour cream less than 12 hours before churning as it will not ripen evenly with the older cream and will thus cause a large loss of butter-fat in the buttermilk.

The Churn

For making butter of good body or texture a churn without any internal dashers or paddles should be used. The swing and barrel churns give good satisfaction. The churn should be scalded and cooled with water to prevent the cream from sticking to the sides.

Temperature for Churning

The proper temperature for churning varies at different times of the year, with character of feed, with period of lactation and breed of cows. As a rule the temperature should be about 60 degrees in winter and 56 in summer, and the cream should be held at these temperatures for at least an hour before churning. If the cream is too warm the butter will come soft and salvy. It will have poor keeping quality and there will be a large loss of fat in the buttermilk. If the cream is too cold it will froth and stick to the churn. It is well to have the temperature so that churning may be accomplished in 25 to 30 minutes and the butter come in firm condition. A dairy thermometer should be used in controlling the temperature.

Churning

The cream should be strained into the churn to remove any hardened curd. Do not fill the churn more than one-third full, as more will lessen the agitation. If color is to be added it should be put in the cream after it is in the churn and before the churn is started. The amount to add varies from none to about an ounce per hundred pounds of butter, depending on the market, season of the year and breed of cow. The churning should proceed in a manner to secure the greatest agitation. If a tight churn is used it should be opened two or three times to allow the gas to escape. Stop the churn when the granules have reached the size of wheat grains. If the butter is churned into balls buttermilk will be incorporated and the butter will deteriorate quickly.

Washing the Butter

Draw off the buttermilk and add as much water to the butter as there was cream to begin with. The wash water should be of about the same temperature as the buttermilk, though if the butter is soft it may be cooler, to firm the butter. Revolve the churn a few times before removing the water. The purpose of the wash water is to remove the buttermilk and thereby improve the keeping quality of the butter.

Salting

Salt serves both to flavor and preserve the butter. Different markets require different amounts of salt. Under average conditions six-tenths of an ounce of salt to a pound of butter should be used.

Working the Butter

Butter is worked to distribute the salt uniformly, to remove excess buttermilk and water, and to give the butter a compact, waxy body or texture. It may be worked in a bowl with a ladle or with one of the lever workers. Overworking causes it to

have an oily or salvy texture and occasionally a fishy flavor. Underworking causes a leaky and mottled butter of loose texture. Butter should be cool at time of working.

Marketing

Butter should be printed or molded, preferably in rectangular shape, and wrapped in parchment paper. If a fancy market is desired it is well to put the butter in special cartons which have printed on them the name of the farm or of the brand of butter, together with statements as to the purity of the product. The style or neatness of the package helps to sell the butter.—W. S. Cunningham, New Mexico College of Agriculture.

DOGS THE FARM SHEEP'S WORST ENEMY.

The number of sheep killed annually by dogs cannot be stated exactly since there are many cases which are not reported at all. Judging from the figures in those counties and states in which reasonably complete reports are obtainable, however, it may be said that in the 36 farm states more than 100,000 sheep are killed each year by dogs. This, it is true, is less than one per cent of the total number of sheep in this area, but a one per cent loss on a business that is being conducted on a profit basis of five or six per cent cannot be ignored. This estimate it must be remembered is also probably much lower than the actual figures. It is certain too that many men have been kept out of the sheep business through fear that in their own particular cases the loss would be much more than one per cent. Any one who has actually seen sheep killed, injured, or frightened by dogs is likely to think twice before engaging in the business. In many cases while only one or two sheep may be actually bitten by the dogs, the whole flock is chased until it dies from exhaustion.

A remedy that is suggested for this situation is a uniform state dog law embodying the principle of a tax upon dogs sufficiently heavy to discourage those who are not willing to take care of their pets from keeping them. Under this plan all dogs over six months of age must be licensed each year, the tax paid at the time of licensing and a metal tag bearing the license number attached to the dog's collar. Any dog found without this tag, unattended and off its owner's premises, may be killed. When found unattended on a farm where sheep are kept the dog may be killed whether it has the tag or not, and under any circumstances a dog caught chasing or killing sheep may be killed. All dogs which can be proved to be sheep killers must be killed whether caught in the act or not, and a reward of $15 should be offered for any one identifying a sheep-killing dog. The money received from dog taxes should be devoted to reimbursing sheep owners for their lost stock and the county should in turn recover this money whenever possible from the dog's owner. A special license should be issued for kennels where large numbers of dogs are maintained under such conditions that they cannot possibly do any harm to neighboring flocks.

While some such plan as this is probably indispensable to the full development of the sheep industry in the United States, there are cases where the flock master will find in its absence the use of dog-proof fences very desirable. The grazing of sheep upon comparatively small areas of land sown to forage crops, instead of upon permanent pastures in larger fields, materially reduces the area to be fenced and makes this a practicable precaution. In the West fences have been built which prove a satisfactory defence against coyotes, and the fence that will turn aside a coyote will turn a dog. A fence of this character can be built as follows:

Posts 7½ feet in length, set 2½ feet in the ground and 16 feet apart; a barbed wire stretched flat to the surface of the ground; 3 inches higher a 36-inch woven-wire fence having a 4-inch triangular mesh; 5 inches higher a barbed wire; 6 inches higher a second barbed wire; 7 inches above this a third barbed wire. Total height 57 inches.

It is important to remember, however, that the bottom strand of barbed wire must be stretched flat on the surface of the ground at all points. If necessary the ground should be graded before the fence is built. Thereafter such small holes as appear may be filled in. It is not always necessary to fence the entire pasture, for dogs usually atack sheep at night only. If a sufficient area can be fenced to give the flock protection during the night, therefore, they may be safely left in uninclosed pastures through the day. This method involves a certain loss of time in driving the sheep to and from the inclosure, but in many cases will be preferred to the expense of fencing on a large scale.

BREAKING COLTS

In breaking the colt to draw a vehicle the horse may develop bad habits unless he is properly handled. The most common cause of balkiness among horses is punishment to make them do something that they can not do or that they do not understand how to do. If the horse balks because the load is too heavy, and he is not allowed occasionally to rest and regain his breath, the use of whip or spur will very often provoke further and more stubborn rebellion. He should be given a short rest, and while he is resting, rub his nose, pick up a front foot and tap the hoof a few times, or adjust the harness, and he may forget his balkiness. Take up the lines and give the command to go ahead, turning slightly to the right or left to start. If the horse does not start it is either a case of overload or a chronic balker. If the former, the load should be lightened, but in the case of the latter, training will be necessary to overcome the habit.

Where the balking habit is fixed the horse should be trained to obey all commands with promptness without being hitched to the wagon. First put on the double trip ropes which consist of a strong surcingle, four two-inch iron rings, two straps to go around pasterns, and a rope about 25 feet long. Fasten two two-inch rings to the underside of the surcingle and put straps with rings on front feet. Run end of rope through near ring on surcingle, through ring on near foot, up and through off side surcingle ring, down, and tie to off fore foot. A pull on the rope when the horse steps will bring him to his knees. Always use knee pads or have the horse on soft ground where he will not injure his knees.

Use the ropes until the horse stops and stands when he hears "whoa." Next put on the guy line, which should be managed by an assistant, while you drive and attend the trip ropes. The guy line is a rope fastened around the horse's neck and a half hitch over the lower jaw. It is very severe and should not be used to excess. If the horse shows any tendency to balk, give the command "whoa" before he stops of his own accord. When ready to start the assistant should take a position in front of the horse and smartly jerk him forward with the guy line at the same time you give the command "get up." Repeat the process of stopping and starting until the horse shows no signs of self-will. Use the guy line and use it severely on the slightest intimation that the horse is going to balk. After a few of these lessons the horse may be hitched to the wagon. The trip ropes and guy line should be kept on until he is well broken of the habit.

In treating the colt to overcome kicking put on the harness and trip ropes. Let the assistant take a stick about four feet long, wrap a gunny sack around one end and tie it. With this the assistant, if he stands at the colt's shoulders and holds the halter with one hand, can rub the colt's hind legs without being placed in danger of his heels If the colt kicks, do not hit him but allow him to examine the stick again, and proceed to stick and pole him all over, that is, make him become accustomed to being touched on any part of his anatomy without kicking. After he becomes submissive to the stick, tie sacks of hay to the traces and breeching and continue the lesson until he pays no attention to it.

Fasten a long pole on either side of him, with one end to drag on the ground, the other end to be fastened to the shaft carrier. Drive the colt around with these, and if he attempts to kick, steady him and pull him to his knees. This should be continued

DE LAVAL SEPARATORS

Save in 7 Ways

QUANTITY of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

QUALITY of cream as evidenced by De Laval butter always scoring highest in every important contest.

LABOR in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easier to clean and requiring no adjustment.

TIME by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

COST since while a De Laval cream separator may cost a little more than a poor one to begin with it will last from ten to twenty years, while other separators wear out and require to be replaced in from one to five years.

PROFIT in more and better cream, with less labor and effort, every time milk is put through the machine, twice a day, or 730 times a year for every year the separator lasts.

SATISFACTION which is no small consideration, and can only come from knowing you have the best separator, and being sure you are at all times accomplishing the best possible results.

Easy to prove these savings

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

until he submits to the poles dragging between his legs and all around him. This is also a good lesson to be given a colt that does not kick, before trying to drive him single.—United States Department of Agriculture, Farm Bulletin 667.

ANNUAL MEETING OF AMERICAN GUERNSEY CATTLE CLUB

The annual meeting of the American Guernsey Catle Club was held in New York City on Wednesday, May 12. and the reports of the year's business furnished added grounds for the optimistic spirit which prevails among the men who favor the fawn and white breed of dairy cattle.

In spite of the serious interference which the unfortunate outbreak of foot and mouth disease and the decline of the importing business has caused the year's work shows a gain in every respect except in the number of transfers.

There was during the past year a total of 11,076 animals registered though the number of imported cattle registered was less than half that of the previous year. This is a gain of 14 per cent in the total registration of the breed. There were 582 more entries for bulls and 710 more entries for cows than the previous year.

The number of transfers this year was 9036 as compared with 9871 a year ago and 8142 the year before. Up to November 1 or the time when the quarantine regulations were first felt, there had been recorded 5334 transfers as compared with 4767 for the corresponding period of a year ago, a gain of 570. During the last six months there were recorded 3702 transfers as against 5106 a year ago, a loss of 1404. The bright spot in this is the fact that 40 per cent of the transfers recorded in the past six months have been received since the first of March.

Fifty-two new members have joined the club. There are now 427 active members.

There has been an increase in the gross revenue of the office business of $8,007.79.

The growth of the Advanced Register has been most encouraging. In the last five years the number of breeders doing Advanced Register work has increased from 93 to 243 and the number of cows on test from 554 to nearly 1200. Eight hundred and fifty-nine certificates for completed records were written last year. The average yield for the breed has increased 150 pounds of milk and eight pounds of butter fat, 3770 records giving the present average of 8,673.73 pounds of milk and 433.91 pounds of butter fat, with an average test of 5.003 per cent. Ninety-three bulls have been added to the list of Advanced Register sires which now totals 566. Sixty-seven of these bulls were sons of bulls already in the list. Five hundred and seventy-nine cows have been added to the list of Great Producing dams, which are those cows which have two or more Advanced Register progeny.

The transfer of the 'World's record over all breeds" from one cow to another within the Guernsey breed was not forgotten, Murne Cowan having recently been honored with that title by producing 28,008 pounds of milk and 1098.18 pounds of butter fat. Her work as well as that of other cows who have recently made large records was thoroughly discussed.

The following officers were elected: President, James Logan Fisher, Philadelphia; vice-presidents, Hon. W. D. Hoard, Fort. Atkinson, Wisconsin; and E. R. Andrews, Putney, Vermont; secretary and treasurer, Wm. H. Caldwell, Peterboro, New Hampshire; members of executive committee, F. G. Benham, Canandaigua, New York; W. W. Marsh, Waterloo, Iowa.

Dr. Woods Hutchinson says: "Sunlight is a splendid and matchless servant in promoting the healthfulness of a house, for which no substitute has yet been discovered. It is foe alike of bacteria and the blues, the best tonic ever yet invented for the liver and the scalp and for everything between, the only real complexion restorer, and the deadliest foe of dirt and disease."

REDWOOD PIPE LONG LIVED

For centuries the only method of transmiting water for domestic use or irrigation other than in open ditch was wood logs bored through the center and connected with slip joints. Constantinople is still supplied with water through wooden pipe manufactured as above. As late as last April workmen employed by a contracting firm in Boston to lay a new water main on Elliott Street unearthed about 2,000 feet of wooden water pipe which according to the records available is at least 125 years old. These ancient pipes were in a remarkable state of preservation and still in condition to carry water for household supply. It is only recently that the old wooden pipes supplying part of the city of London were discarded because new and modern high pressure systems were installed.

As to length of life it is conceded that cast iron pipe is the longest lived pipe made; the only pipe approaching it in life is redwood stave. Both will last more than a lifetime. Consequently the only comparison in that respect is cost. Redwood stave will outlast several steel or corrugated iron pipes as they are open to corrosion, particularly in the alkaline soil prevalent throughout the West, whereas soil conditions have no effect on redwood.

Redwood stave pipe is made to withstand water pressure from 0 to 400 foot head, and at least one company manufacturing redwood stave pipe will guarantee it for 400 foot head and guarantee it for 100 per cent overload or 800-foot head. This puts beyond question its ability to hold pressure. The difference between the low head price of redwood and the high head is the amount of metal or rather the spacing of the metal on the pipe, the thickness of the staves varying but slightly.

Redwood is essentially adapted by nature for pipe use, being straight and even grained, free from any resinous matter, free from pitch pockets or pitch seams and free from the defects inherent in pipe made of other wood such as the uneven expansion caused by the hard spots in the wood and the decay inevitable around pitch pockets or pitch seams when under saturation. Redwood having no hard spots expands evenly forming tight joints and consequently there is no leakage. Having neither pitch pockets nor seams to break down the cells of the wood it is free from decay. There are many instances of redwood pipes in the western country that have been in daily use under all sorts and conditions of climate and soil for 25 to 30 years and they are still in perfect condition, free from decay and good for as many more years of actual service. Redwood being free from corrosion, the pipe made of it cannot leak in spots as is the case in metal pipe and in case corrosion attacks the bands the pipe can be rebanded without being taken out of service or the flow of water ceasing.

TONICS FOR HOGS.

We have often advised our readers to keep ashes, bone and charcoal before the hogs when at pasture. This seems to be specially needed when the hogs are in an orchard. It is sometimes desirable to give something besides the ashes. Dr. R. H. Williams suggests the following: Charcoal, 8 pounds, air-slacked lime 8 pounds, common salt 6 pounds, hardwood ashes 8 pounds, powdered sulphur 4 pounds, powdered blue stone 2 pounds.

These should be thoroughly mixed and kept in stock so that a small supply may be before the hogs at all times. A low box makes a useful container.

We have known of cases where these things were made into a "lick ball." This was made of clay and kept under a shed where the stock could come and lick it at will. While these "tonics" will help keep the hogs thrifty, let no farmer imagine that this will prevent or cure hog cholera, for it will do nothing of the sort.—Rural New Yorker.

THE BROODY HEN.

Written for the California Cultivator
By Jean A. Koethen.

EGG-LAYING, as has often been said, is merely reproduction. The primitive hen laid a few eggs, then incubated them and raised her brood. When her chicks were old enough to care for themselves she was ready to lay again. She did this perhaps two or three times in a season, then stopped laying till the next spring. This instinct for incubation has been to a large extent bred out of Leghorns and other Mediterranean breeds, but it is found in practically all hens of the heavy breeds.

Theoretically it should be possible to breed this instinct out of all hens; practically there is no reason why we should. While the Mediterraneans on an average lay more eggs in a year than Rocks, Wyandottes and Orpingtons, so many individuals of these breeds have out-distanced Leghorns in their egg-records, in spite of occasional broody spells, that we can by no means make the sweeping statement that non-sitters are better layers than sitters. The sitter, thanks to her greater amount of fat and warmer feathers, is almost sure to be a winter layer. She is also, if she is allowed to hatch a brood in late spring, quite sure to be a good summer layer, and if she is allowed to sit in early summer, she will molt quickly and easily and be ready for business in the fall. I have been watching sitters and non-sitters side by side for two years, and as far as I can see the latter have very little to their credit in the comparison.

The broody hen is theoretically a tired hen. Her nerves are exhausted by laying and she needs to recuperate. If she is not tired she is very likely overfat and needs to be reduced a bit. Personally, I am inclined to add a third to these two classes of broodies—the hen that is just perversely broody because she wants to be. We all know her. She lays 16 or 18 eggs, then goes broody and insists and insists till her caretaker's patience is exhausted on her right to raise a family. After two or three weeks she begins to lay again but goes broody as before. The best place for such a hen is the Sunday dinner table. Certainly she should never be used as a breeder.

In breaking up broodies it is better generally to take it for granted that they are tired and need building up. In order to begin this building up or recuperative process as soon as possible the hen must be made to forget her desire to sit. Three steps are necessary here:

First, get her off the nest as soon as her broodiness is noticed. Whenever a hen is found on the nest at night when the other hens are eating their supper she may be considered a broody and treated accordingly. The longer a hen stays on the nest the stronger becomes her desire to sit. Hence the wisdom of leaving a hen that is to be used in hatching right on her old nest for a night or two. I have broken up many a hen by moving her the first night and so I know that conversely the sooner a hen is taken from the nest, the more readily will she forget her broody desire.

Second, put her where she cannot sit. What is done with the hen after she is removed from the nest depends largely on the convenience of the caretaker and the disposition of the hen. On a large egg ranch a jail or broody coop is a necessary part of the equipment. The hen is kept four days in this jail, supplied with food and water, and at the end of the fourth day is returned to the laying pen. Where only a small number of hens are kept all that is necessary is to remove the hen to another pen where there is no nest. An Orpington will usually recover from her broodiness if she is merely placed in a different pen and will rarely go onto another nest. A Buttercup, non-sitter as she is, is more persistent, and will sit anywhere. For hens of this sort a jail with a slatted bottom, where there is no chance to sit, is almost a necessity.

Third, feed her well. The broody hen should be provided with all the green feed she will eat and with the materials she needs for egg production so that she will be in shape to begin laying as soon as her broodines has passed. A good mash containing plenty of protein or meat, table scraps, clabbered milk, anything a little more appetizing than her usual fare, will help her to forget and to get ready for laying again. The idea that a hen must be starved out of her broodiness is one of the greatest mistakes. There are cases, I know, where a hen is very unwilling to forget, and harshness seems almost justifiable, but it never pays. I have found merely taking a hen from the pen and letting her run a few days on green range a very easy way of controlling broodiness. It may not work with all hens, and it may not work with hens that are left on the nest several days before anything is done to break them up, but it has always worked for me.

It is sometimes said that the best way to break up a broody hen is to let her sit. This is true enough, but like many other wise maxims it must be taken with a grain of salt. No doubt it is better for the hen to sit provided she does not ask to sit too often. This is nature's way, and the hen that raises a brood in April and another in September will very likely lay better between-times. It is not wise however to try to raise summer chicks unless you have room and clean ground for them and time and inclination to care for them. Neither is it wise to set the hen that goes broody in January. Depend upon it, she is your best layer, and the hen you ought to breed from. Better break up the hen that wants to sit at the wrong time, get her back to laying as quickly as possible and give her her chance when you want chicks and can care for them. If, with all this consideration, she is still disagreeably persistent, eat her.

BAD HABITS AND THEIR PREVENTION

Lack of exercise is the chief cause of all bad habits as developed in a flock of chickens. Lack of exercise is generally brought about by insufficient or worn litter. It is a noticeable fact that all bad habits are started in the winter when fowls are more or less confined. On general principles in order to prevent bad habits, when getting started, see to it that your poultry of all ages exercise as much as possible, especially when confined. Provide a litter, loose and dry, of wheat straw at least 12 inches deep.

Egg-eating is probably the most objectionable of all bad habits. It is a vice generally brought about by overcrowding, lack of exercise, lack of proper shell-forming material and improperly constructed nests. Low down nests are also sometimes the cause. To prevent egg-eating, make your fowls exercise for practically all the feed they get. Do not overcrowd, allowing at least four square feet of floor space per fowl; provide plenty of oyster shell and grit; locate nests in a dark and secluded place raised several feet above the floor, so they will have to fly in order to get to the same. Guard against having and leaving broken eggs around so they can find and eat them. The feeding of egg shells without breaking them often leads to this objectionable habit.

Probably the surest way of curing this bad habit is by cutting the guilty party's head off, is she is known. This practice is especially advisable when only one or two have contracted the habit. Feed plenty of grit and oyster shell and add alfalfa leaves to their ration. In experiments it has been proven that one of the greatest causes of egg-eating hens is the lack of oyster shell.

Another vice to which confined and overcrowded poultry lacking exercise and proper food often fall prey is the feather-eating habit. It is a most objectionable habit when it once gets thoroughly started in a flock and one which in a short while will greatly damage the general appearance of the flock. Often it leads to drawing blood and eating at the sore places, some in the end turning cannibals. Probably the two greatest causes of this habit are lack of exercise and proper foods. Free range stock very seldom contract the habit and if they do contract it it is because they are lacking something in their ration. If you have a flock of fowls thus affected the first thing you want to remedy is the provision for exercise. Make them work all day long for everything they get. Feed plenty of animal food in the form of beef scraps, green cut bone and blood meal. Do not forget the regular feeding of green food daily, because very often a lack of the same brings on the above vice. If you think over-crowding is the cause remove the cause by providing larger quarters.

Another way of stopping this habit is by annointing the feathers about the picked area with an ointment made by adding a tablespoon of aloes to a cup of lard, rubbing the same well together. After one or two bitter doses of feathers thus treated the birds will usually stop pulling and eating them.

In closing let me remind you that all bad habits are brought about by either the lack of exercise or some food or by being kept in a very crowded condition. Remedy these and as a rule you will not be bothered with any bad habits in your flock.—Farmers' Review.

Provide shade for the fowls. They will do better during the hot summer days.

Doctors say that worry kills more people than work—probably because more people worry than work.

COULSON'S EGG FOOD

Contains every ingredient that hens need—mixed just right to give a balanced ration—makes hens lay longer—keeps them healthy—pays for itself by increasing egg production—saves your time—puts money in your pocket.

Scientifically mixed by machinery from a formula based on years of experience.

DUCKS

Selected Indian Runner and Mammoth Pekin Duck eggs. Write for special prices. Black Bros., 455 Lucas, Los Angeles.

THE GARDENETTE.

"The Gardenette, or City Backyard Gardening by the Sandwich System," by Benjamin F. Albaugh, published by Stewart & Kidd Company, Cincinnati, at $1.25 net.

Primarily this book is intended for the city "farmer," but for any one who has a desire to get the most out of the small garden patch it has a world of information. There are two parts to the book, the first being given over to vegetable gardening, the second to flowers and ornamentals. There are many full page halftone illustrations, several plats showing methods of laying out the garden, and all the way through explicit instruction for each step to take to secure certain results with vegetables or flowers. One little feature described is well worth the price of the book. It is on page 26, while the illustration making it all plain follows. It touches upon "the plant incubator." It appeals to us that it would be far better than the hotbed and almost equal to the regular glass house. It is comparatively inexpensive, the essential feature being a box two feet square covered with a platform on which is room for three flats each capable of growing 150 plants. Within the small square box underneath is placed an ordinary hand lamp, and the heat from this warming a sheet of iron gives the under heat necessary to the propagating of many plants. The cost of running this outfit is two cents for 24 hours, according to the figures given in the book.

The calendar or planting table should be hunched ahead a few weeks or possibly months to make it fit California conditions. Excepting that we do not see why the instruction given in the book should not be most helpful to every Californian.

From the first page of the flower gardening part of the book we take one paragraph:

"No one need be deterred from attempting to grow flowers successfully because of limited space or because of unfavorable conditions, for there is such a wide range for selection that it would seem as if plants may be chosen that are suited to thrive in almost any condition of soil, exposure, etc. Of course many varieties require plenty of sunshine, but there are others which do equally well when shaded. Some varieties need plenty of room and do best when isolated, or as single specimens. Others thrive when somewhat crowded. So there is ample opportunity to choose those adapted to varied conditions."

A WISE YOUTH.

A small boy had been vaccinated and after the operation the doctor prepared to bandage the sore arm, but the boy objected.

"Put it on the other arm, Doctor."

"Why, no," said the physician, "I want to put the bandage on your sore arm, so the boys at school won't hit you on it."

"Put it on the other arm, Doc," reiterated the small boy; "you don't know the fellows at our school."

Questions and Answers

THE EDITOR AND STAFF

"Orange" Rust

I send rose leaves covered with yellow or rather orange colored spots. What are they and what is the remedy?—Subscriber, Soledad.

This orange colored rust is rather perplexing to handle on blackberries and roses. Bordeaux of 4-5-50 strength is the safest to be applied after cutting off all parts of the vine or bush which are affected. There is no saving of leaves on which fungus has secured a foothold. The only thing to do is to subdue the spores of the disease so that new growth may be freed from it.

Twig Borer

I am mailing package containing twig from olives showing small round hole at the place of junction with larger limb, also in same box the insect which causes the trouble. What is it and how should it be handled?—Subscriber, Greenfield.

This is the common branch and twig borer, description of which can be seen on page 238 of Essig's "Injurious and Beneficial Insects." It not only infests the olive but also the branches of almonds, apples, apricots, cherries, figs, orange, peach, pear and many others of our fruits. As the damage is not great from this pest there is no control measure possible within economic bounds.

New Zealand Rabbits

A New Zealand doe had young outside the nest prepared for her and one rabbit was found dead outside the hutch. I inspected the hutch and nest, but failed to find any more, so concluded she had eaten them. She appeared large, as if she had not yet had young, but there was sufficient evidence in the hutch (but not in the nest) to show that she had. The next day, to my surprise, I saw fur in her nest and further inspection showed it to be full of rabbits. She was bred to one buck and was with him from six to eight hours.—Subscriber, Los Angeles.

As you do not state whether your doe was kept separate from any bucks I take it for granted she was kept continually alone after breeding, which rabbit fanciers know is necessary in many cases if premature birth or miscarriages are to be averted, although sometimes even if the doe is kept separate from all other rabbts in a hutch the above fate is liable to befall the offspring, due to sudden fright or fear at some passing object or cause in nature's development. The latter cause no doubt brought on the incident you mention, as the one you found dead was either "still-born" or had frozen to death from exposure by getting out of the nest, as many do, or by being trampled to death. I may add it is not necessary to leave the doe with the buck over five minutes if she receives him. This is much more satisfactory than leaving them together for a longer period.—R. V. M.

Spraying Olives

Is it safe to spray olives with Bordeaux, especially where trees are in full bloom? What is the best time of the year for spraying?—Subscriber, Los Angeles.

We would defer all spraying until after fruit is set unless there is serious fungus trouble. Spraying for most insect pests, however, is more effective in the fall—September to December. For that use the kerosene emulsion or at least some insecticide. Bear in mind that Bordeaux is only a fungicide and has no effect whatever on insects.

California Vine Disease

Grape vines on my place are dying of a disease which experiment station terms "California vine disease." Is this the disease also called phylloxera? Is there not a stock that is resistant? I am informed that there is no remedy for the disease, which is gradually taking all vines in my home vineyard.—Subscriber, Lankershim.

There is a material difference between the California Vine Disease and phylloxera. Phylloxera is an insect which attacks the roots of the vines and may be to a degree overcome by planting resistant vines. The California vine disease has killed thousands of acres of thrifty vineyards and is among the most destructive of plant maladies. In its effect and methods of work on the vines it much resembles peach yellows, the pest of the eastern peach orchards. Owing to its first observation in the vineyards at Anaheim, Orange County, it is often called the Anaheim disease. As the cuttings from these vines are almost sure to be diseased they should never be used for propagating new vineyards. It has been found that cuttings from healthy vines often do well in the ground from which the diseased vines have been removed. As to treatment, once the disease has shown in the vine we believe there is none.

Fig Not Bearing

I have fig tree about three or four years old that never ripens any fruit. The fruit sets and after growing to an inch in diameter shrivels up on the tree or falls. Can you tell me what is the trouble? The tree is on rather heavy red soil underlaid with hardpan.—Subscriber, Porterville.

Presumably this is the Smyrna fig which must be fertilized with pollen from the wild fig, usually called caprifig. In order to accomplish this a small insect known as the blastophaga, or fig wasp, has been introduced from Asia Minor, and all growers of Smyrna (sometimes called Calimyrna) figs find it necessary to grow other trees on which these wild or inedible figs grow and remain the year around. At about this time of year these wild figs are placed in orchards of commercial figs and the insect as it escapes from the wild figs enters and fertilizes the blossom in interior of the others. In the case of only a tree or two it will probably be necessary to write to Mr. Roeding at Fresno, or someone who has caprifigs for sale, and obtain and distribute these through your tree.

Almonds Not Bearing

I have almond trees four or five years old that blossom sparingly and set very few nuts. What is the cause of the trouble?—Subscriber, Porterville.

Perhaps the bloom which comes on your tree is not fertilized by pollen of some other tree. It has been the practice in commercial orchards to arrange alternate rows of different varieties which bloom at the same time. For instance, Nonpareil or N. P. U. should alternate with Drake's Seedling or Texas Prolific, while the I. X. L. should alternate with Peerless. As to your tree not blooming profusely it may be due to poor variety or lack of vigor in the individual tree.

Spotted Liver

Please advise me if there is any cure for spotted liver in rabbits. They seem perfectly healthy, but when they are killed I find the liver all full of white spots.—Subscriber, Pomona.

The usual cause of spotted liver in rabbits is soured food and lack of exercise. Sometimes with these things well provided for they will get it anyway. It is not difficult to stamp out and does not affect the meat otherwise. The liver, however, is spoiled and must be thrown out. Give animals so affected and the young stock a little of Pratt's or other good animal regulator, about one-sixth what you would give to young lambs according to the directions, in the water at the morning meal. In the evening put about one teaspoon of sweet spirits of niter in each gallon of drinking water for them, especially for the young. A disinfectant may be made by mixing creosote oil with a dilution of water and mixing that with what sawdust it will dampen well. A handful of this thrown in the corner of the hutches and runs will work wonders for the health and appearance of the rabbits. A rabbitry should be kept as clean as a butcher shop if healthy animals are expected to be kept in it.—R. V. M.

Slobbers

Will you please tell me what to do for rabbits when eyes and nose swell shut? They have to breathe through their mouths and soon die. They have clean quarters and variety of feed. Some only live one or two days; others a week.—Subscriber, Fillmore.

Rabbits affected with swell heads with nose and eyes swollen shut are troubled with those almost incurable diseases known as slobbers and sniffles which are brought on in the form of a cold or pneumonia, due usually from being exposed in cold, damp or drafty hutches. It may also be inherited. Drastic measures are necessary. Separate immediately all that are affected. Disinfect all hutches with a solution of carbolic acid. Make an oil of four ounces of sweet oil, two drops of carbolic acid, six drops of turpentine, and six drops of camphor. Shake well and put in a small new oil can. Shake well each time used. Put five drops of this mixture in each nostril of each animal that you suspect to be affected, twice a day. Feed clean, dry hay and alfalfa that is not dusty, and clean grasses. Above all use above treatment regularly. They are of little use without. A little regulator in their drinking water is also beneficial. If your stock are wet around the eyes and mouth they have the slobbers which is a disease prevalent among many rabbitries. An excellent remedy is to put two drops of muriatic acid in each pint of drinking water every other day for a week or so. Separate all sick from the rest. Disinfect with creosote oil or with carbolic acid diluted and mixed with sawdust, then thrown into the corners of the hutches. After you are free from the trouble be sure to dust a little salt on each ration of grain each day. This is one of the best preventives of slobbers or indigestion. Rabbits in confinement should never be fed green foods such as alfalfa, hay or grass, unless sparingly, and never cabbage. They do much better on dry alfalfa, bran, rolled barley and other grains with a fresh carrot or two occasionally.—R. V. M.

Kerosene Sprays

Would kerosene emulsion applied to citrus trees with a good hand pump be as good as when applied with a power driven machine, using a mechanical mixture of kerosene and water instead? That is, will the hand pump have force enough?—Subscriber, San Diego.

Kerosene emulsion may be applied with a hand pump nearly as effectively, though less economically, as with a power pump. It is entirely different, however, with the ordinary kerosene or distillate mixture with water. This is only effective when the mixture is complete and the pressure strong, and that can only be secured by such thorough agitation as is given by the large power outfit. Kerosene, if properly emulsified, remains in solution and all parts of the mixture are of equal strength. The common mechanical mixture proceeds to separate the moment agitation is stopped.

THE WISE FOOL.

"Dead men tell no tales," observed the Sage.

"Maybe not," replied the Fool. "But their tombstones are awful liars."

Los Angeles Lumber Company Makes Announcement

The Robert Holmes Lumber Company of Los Angeles wish to announce to their friends and customers that they have perfected an arrangement with the Salt Lake Railroad Co. for the renewal of their lease, and will continue to operate their lumber yard at the old location.

They have added a complete stock of hardware, wire fencing, poultry netting, etc., to their stock, and are quoting some very low prices on both lumber and hardware.

They are especially well equipped to handle out-of-town shipments, having a railroad track direct into their yard where they can load cars for all roads leading out of Los Angeles. A letter, wire, or phone call will receive prompt attention. The Robert Holmes Lumber Co., 2150 East Seventh St., Los Angeles. Phone 41335, Boyle 73.

Some More Uses for Cornstarch

Tasty Dishes That Can Be Quickly Prepared With This Delicious Food Product.

Among the many things in which cornstarch can be used with pleasing results are wheat bread, graham bread, biscuits or short cake crust, popovers, graham muffins, corn gems, brown bread, French rolls, griddle cakes and waffles, buckwheat cakes, fritters, pies, cakes, cookies, fillings and icings, puddings, custards, sauces, soups, gravies, ice cream and many other delicacies too numerous to mention.

It is self-evident, therefore, that an ingredient which can be used in so many ways should be thoroughly understood by every housekeeper—in order that she may enlarge the possibilities of her cooking to the utmost.

But to obtain the best results with cornstarch recipes, it is absolutely essential that the best quality of cornstarch be used. One of the leading culinary experts—referring to correspondence she had had with housekeepers all over the country—states as follows: "I found that their experience was the same as mine—that those who had the greatest success with cornstarch recipes always depended upon Kingsford's."

This famous brand has been the favorite of discriminating housekeepers for many years. It can be obtained at all modern grocers. Order a package of Kingsford's today, and ask for the little Kingsford's cook book containing hundreds of valuable cornstarch recipes.

The Household Department

LEANIN' ON YOUR HOE

By Winston W. Wharton

You talk about the comfort
You have had along the way,
About the blissful moments,
When your work gave place to play,
But of all ecstatic hours,
There are "none such," I know,
Like moments in the garden
A-leanin' on your hoe.

Most likely in the springtime,
When the flowers burst into bloom,
And the corn and beans and lettuce
Are a-fightin' weeds for room:
You start out while it's dew-wet
To clean out every row,
But long before it's meal time
You're leanin' on your hoe.

You maybe planted taters,
A paradise of spuds.
You hoe and dig among them
And sweat out all your duds:
When at last you've gone your limit
And a breeze begins to blow,
There ain't no rest in all the world
Like leanin' on your hoe.

O you talk about the comfort
Of a cushioned rockin' chair,
Or a pew on Sunday mornin's
Where you sleep all through the prayer,
But there's nothin' rests the conscience
And mind and body so,
Like stoppin' when you want to
And leanin' on your hoe.

O it may be in the mornin',
Or at noon or later still,
That, amid the ceaseless chopping,
You receive a Sabbath thrill,
And you pause, O blissful moment,
Softly sounds a vesper low,
And you're caught to realms supernal
A-leanin' on your hoe.

THE OLD SQUIRE'S EDEN.

By C. A. Stephens in Youth's Companion

On the upper side of the north field at the old squire's was a great rock overshadowed by a huge sugar maple; just below the rock was as pretty a little field as you could wish to see. It was not much larger than a good-sized house lot, but its soil was of deep, clear, yellow loam, and it had a gentle southern slope that caught the sunshine. To the north and west the woods above the rock sheltered the field from the cold winter winds and the fierce summer thundershowers. It was such a pretty spot that we called it the old squire's "Eden," and sometimes the old squire's "garden," although he never raised flowers there, or even garden vegetables—except one kind. In point of fact, the best name for it would have been the "potato-ball garden," for there, season after season, for more than 20 years, the old squire had been experimenting with potato balls.

As farmers well know, the various varieties of potatoes tend to run out in time,—or did tend to do so under former methods of cultivation,—and have to be replaced by new ones. Several varieties had run out at the old squire's, and he was constantly trying to grow new varieties by planting the seeds in the potato "ball." Two or three seasons are needed to grow edible potatoes in that way. The first crop is usually immature. Nor can you ever be sure what kind of potatoes you will get from planting the balls of even the best varieties. It is usually a poor kind, but occasionally a very good variety appears.

A fine new variety of potato is likely to be very profitable to its grower; he can sell it a high price for field planting, until other farmers get enough of the potatoes for seed.

The old squire hoped to grow an extra good variety in his potato-ball garden, and to make us all rich. The old gentleman was always optimistic—"schemy," grandmother called him,—and usually had high hopes for the success, not only of his potatoes, but of his hops, sweet corn, and other farm products.

Every spring, and sometimes also in the fall, he planted potato balls, from different varieties, up there by the great rock. In September he dug up what had grown during the summer, and put them into several carefully labeled bins in the farmhouse cellar; the next spring he replanted them, each kind by itself. He repeated that process for two or three or perhaps four years, until he had produced well-matured potatoes, and could see whether they had real merit as a new variety.

In time, the old squire came to be somewhat of a potato expert. Many of the varieties that he raised proved valueless; but now and then he grew a pretty good variety that he could recommend farmers to raise. There was one small kind that he called the Nest Egg, because it was white and smooth, and shaped much like a hen's egg. Another kind he named the Round Reds, and another Ruth's Favorite, because grandmother liked them for cooking. Then there were the Beauty of the Forest, the Irishman's Dinner, the Pearl Whites, Irish Dumplings, and the Long-Live-in-the Ground, so named because the seed lived in the patch, and for three successive winters survived the frosts.

But the best variety of all was the Bobolinks. The name came from a pet bobolink that Theodora had tamed that summer. The bird was a vociferous singer, and whenever the old squire went up to his potato garden, the little bird flew after him, perched on some tall weed stalk, and then burst forth into his merry song.

After these flights in the free air the bobolink would always come back to its cage to be fed.

The Bobolink was a superior kind of potato, and bade fair to be very profitable to us. As I remember, it was yellowish white in color, of good size, but not too large; in shape it was a little elongated and ovoid. It had a thin, smooth skin, from which the soil dropped off cleanly; and its "eyes" were not deep-sunk, but on the surface. When it was boiled, the skin cleaved off; and when either boiled or baked, it was very mealy, and had a fine flavor. Moreover, it grew fast and ripened early; the tops showed no tendency to "rust," and it kept sound throughout the winter. Another good point was that the potatoes grew in a compact cluster in the hill, and could be easily dug.

There were three rows of Bobolinks, each about twenty yards long; the old squire thought that there would be at least five bushels of them. His plan for getting the variety known was to give one or two of them to various farmers, far and near, for them to examine and eat. He felt sure that many would want the Bobolinks for seed, and that as their fame spread abroad, there would be a steady demand for all we could raise, for ten years, perhaps.

It was then about the tenth of September, the beginning of the harvest season. One cloudy evening I had been at our nearest neighbors, the Edwards's, playing checkers with Tom. We got interested in a long, slow game, and it was almost 11 o'clock before I started for home by the path across the fields.

I hurried,—for bears were sometimes roaming about at that time of year,—and just as I was passing behind our west barn, to reach the back door of the farmhouse, I heard a queer little noise, like the clink of a hoe on a stone. I was thinkin more of bears than of hoes, I guess, and as I knew no bear had made that noise, I went on indoors and stole up the chamber stairs. The house was dark, for everyone was in bed.

As I undressed, however, it occurred that it was very odd to hear a hoe clink at that time of night. As

A Good Table and Cooking Syrup

Its Many Possibilities in the Hands of the Skilled Housewife

In addition to its well-known uses as a dressing for the bread of little tots, as well as for the griddle cakes and waffles of the grown-ups, a good syrup serves many important purposes in the hands of the skilled housewife. It is one of the principal ingredients in the making of many candies and desserts, while a little dash of it has a most pleasing effect in the preparation of hundreds of other dishes.

When baking ham, if a good table syrup is substituted for brown sugar to mix with the bread crumbs and yolk of egg with which it is covered before the final browning, a finer flavor will be obtained; while brushing pastry lightly with syrup will give it that fine glaze considered so desirable.

For all of these purposes the famous brand of Karo Syrup is most strongly recommended. No less an authority than Marion Harland states: "I do not hesitate to award Karo the preference above any other table syrup used in my household."

Karo Syrup can be obtained at all modern grocers. When ordering Karo, ask for the little Karo cook book, which contains hundreds of valuable recipes—many of them contributed by famous culinary experts in all parts of the country.

I now remembered, the sound had seemed to come from up near the woods, north of the west barn—the direction of the old squire's Eden. Even then I did not suspect anything in particular. Instead of getting into bed, however, I went to my cousin Addison's room and waked him.

"What do you want" he muttered sleepiiy.

"Ad," I said, "what do you suppose anyone is doing with a hoe up in the old squire's Eden at this time of night"

"Who is" said he. "How do you know?"

"I heard a hoe clink up there as I came in," said I.

Addison sat up. "That's queer!" he muttered, and then asked me whether I were sure.

"Pretty sure," said I.

He thought a moment, then jumped up and began to dress. "Let's go up there and see," said he.

We went quietly downstairs. It was very dark. We lighted one of the barn lanterns—which shows how little we really thought that we should find thieves there—and went up to the squire's Eden. All was quiet.

"Guess you imagined that noise," Addison said, and then, holding the lantern low, he looked along the potato rows. "By jingo!" he suddenly exclaimed. "Some one has been digging potatoes here! Look at the fresh dirt. It's the old squire's Bobolinks, too, and"—following fast along the three rows—"they've dug every blessed hill of them!"

"The thieves can't have gone far!" I exclaimed.

"That's so. We'll catch them."

We blew out the lantern, and then Addison went in one direction, out toward the highway, and I in the other, toward the Edwards farm. We listened as we ran, but heard no sound of anyone stealing away.

We now ran back to the house and waked the old squire. He was at first incredulous, and went up to the rock with a lantern to satisfy himself. Our first conjecture was that hunters or woodsmen had stolen the potatoes for food; but if that were so, it seemed very odd that they had not touched any of the other kinds growing there. At the head of each row of Bobolinks we had set a little stake with the name of the potato written on it. Every hill in those three rows had been cleanly dug, as if the thief had intended to get every potato.

(Continued Next Week)

LEGGINS AND MITTS

A lad of outdoor proclivities made it clear that he had come to the library only because his mother had sent him to get some "leggin's." The young woman at the desk hesitated, and did not look responsive.

"And if you haven't no leggin's, I was to take some mitts."

The conjunction brought a flash of enlightenment, and she brought him a suitable selection of legends and myths.

Many People Suffering From Ants

Thousands of People Welcome This Simple Method of Relief.

Certain pests are often confined by condition to certain localities, but ants can be found most anywhere. Ants not only are an annoyance, but they are dangerous as well—spreading disease germs in the same manner as flies and mosquitoes. Nothing tries the patience of the good housewife any more than to find them in the sugar and the jam, and over-running the entire pantry.

There is no need of putting up with this annoyance any longer, however, for a very simple remedy is now available. It is known as Kellogg's Ant Paste and can be obtained at all modern druggists. This paste seems to have almost supernatural powers over ants. Not only will it drive every ant out of the house, but will prevent their ever getting a foothold in your place again.

Try a package today—the results will be a revelation.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Blackberries Cream
Shirred Eggs Cream Muffins
Coffee

Lunch or Supper

Baked Macaroni Summer Squash
Egg and Lettuce Salad
Cracker Pudding Tea or Milk

Dinner

Pot Roast of Beef
Potatoes a la France
Creamed Lima Beans
Rolls Spiced Blackberry Jelly
Gold Cake
Ripe Apricots with Cream
Coffee

New Potatoes a la France

Three tablespoons butter, two pounds new potatoes, two sprigs mint, one teaspoon salt, one tablespoon chopped parsley, one tablespoon lemon juice. Wash and scrape potatoes. With round vegetable cutter scoop out from potatoes a number of little balls. Boil these until tender in hot water to which has been added salt and mint. Drain, add butter, parsley and lemon juice. Toss about gently in pan a few minutes and serve on hot dish.

Delicate Cracker Pudding

Roll three crackers fine, pour over them a pint of boiling milk; stir well together and add three tablespoons of sugar, a pinch of salt and the yolks of two eggs. Mix together thoroughly and bake in a deep dish half an hour. Beat the whites of the two eggs stiff, adding a tablespoon of powdered sugar and one-half teaspoon nutmeg and one-half teaspoon cinnamon. Pile on roughly and brown lightly.

Gold Cake

Three-fourths cup sugar, five tablespoons butter, one-half cup milk, four yolks of eggs, one and one-half cups flour, one-half teaspoon salt, three teaspoons baking powder, one-half teaspoon lemon extract. Cream butter and sugar together. Beat egg yolks very light and add to creamed mixture. Add dry ingredients, milk, and lemon extract and mix well. Turn into a small greased and floured cake tin and bake in moderate oven 45 minutes. Sufficient for one small cake.

Baked Macaroni

Boil one-half pound of macaroni in salted water 20 minutes and drain. While the macaroni is cooking put over the fire in a saucepan one cup of cooked or canned tomatoes; add a pinch of soda, one cup of milk, one-fourth pound of cheese cut fine, a little chopped ham or bacon and seasoning. When boiling hot pour over the drained macaroni and bake one-half hour.

HEMSTITCHED SEAMS

We find, on ready-made clothes, finishing touches of many kinds which make them look chic. The home dressmaker is able to imitate many of these with comparatively little trouble.

In the last few years seam beading has been used to a large extent, but it does not give the same effect so often seen on ready-made garments, especially on those made of silk or fine materials. This finish may be obtained by loosening the upper tension of the sewing machine and lengthening the stitch. The two pieces of material which are to be seamed together are placed on top of each other with their edges even. Two layers of blotting paper are then inserted between them and they are either pinned or basted to the paper to hold them in place. The seam is then stitched and the blotting paper torn out. The sides of the seam are turned back, leaving the hemstitching open.

These seams are quite durable and add to the appearance of a garment. This method may, also, be used to give a hemstitched appearance to the hems of pillow slips and sheets.—Hazel Emigh, Colorado Agricultural College.

CORRECT

"What is the most difficult disease you have to contend with?" asked the student.

"Imagination," replied the doctor.—Cincinnati Inquirer.

Gas Stove Convenience with Kerosene

Cooks the Cooking Not the Cook

A good oil stove concentrates all its heat at the cooking point. That avoids an overheated kitchen and that means comfort for the cook even on hot, sweltering summer days.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

An oil stove brings the convenience of gas to homes without gas. No heavy fuel to carry. No dirt and ashes. And yet it cooks anything a big coal or wood stove does. It is clean, convenient, economical. No odor. Does not taint the food. Ask your dealer. See exhibit, Palace of Manufactures, Panama-Pacific Exposition.

San Luis Obispo	.00	28.16	20.51	78	44
Los Angeles	.00	17.04	15.62	80	56
San Diego	.00	14.41	10.01	72	58

There was received on the San Francisco market during the last six days 3365 tons of hay. The market has been fairly good, although not particularly active. All of the above arrivals having consisted of old crop, with the exception of some first-cutting alfalfa from the river district. A good quality of hay is always a prime factor in determining a market. Our last year's harvest was of such poor quality, generally, that it burdened this market so heavily that it brought down the prices on the better qualities. We are led to expect a good quality of grain hay this year, which will be a satisfaction and a benefit to everybody concerned. The alfalfa hay market has been rather quiet lately, but more activity is expected and a better demand is looked for in a short time. The market on straw is dull with very little offering.

We quote the average wholesale selling price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	13.00@14.00
No. 1 Wheat or Wheat and Oat	11.00@12.00
No. 2 Wheat or Wheat and Oat	8.00@9.00
Choice Tame Oat	12.00@12.50
Other Tame Oat	7.50@10.00
Barley	5.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, per bale	40@45

GRAIN

Alfalfa Seed	16½

Citrus Fruit Market

LOS ANGELES, June 16, 1915.

About the best orange market of the year now prevails. It is hoped this favorable condition will continue for a few weeks, at least, until peaches come in. Sales are being made which mean close to a $2.10 f. o. b price. The best of it is the demand is keen and nearly every offering is quickly picked up.

On the contrary, lemons are showing about the worst market of the season; in fact, the worst in the history of the industry. Many sales have been made in Eastern markets at $1.00 or under, which means a great loss to the producer. Weather still continues cool and disagreeable.

Shipments

Shipments of oranges from Southern California since November 1, 1914: 27,223 cars, lemons 4,343 cars, total for the season 31,566; last year same date: oranges 29,545, lemons 1,934, total 31,479. From Tulare and Central California points, this season: oranges 5,628, lemons 197, total 5,825; last year same date: oranges 5,797, lemons 30, total 5,827; from Butte and other Northern California points, this year's orange shipments 630, lemons 2; last year to same date, oranges 405, lemons 5.

NEW YORK, June 14.—Eighteen cars Valencias. eight navels. three sweets, one St. Michaels, one seedlings, two mixed cars. and five cars lemons sold. Market is higher on oranges and lemons. Fair and warm.

Strawberries, cases, 24 quarts, 2.75@3.00. Red raspberries, cases, 24 pints, 4.50@5.00.

FERTILIZATION OF VEGETABLES

(Continued from Page 680)

ities of vegetables are largely dependent on conditions that make possible quick and uninterruped growth. When growth is interrupted or unduly retarded, then some undesirable quality of flavor, texture, color, etc., is likely to develop. So far as interruption of growth is due to lack of sunshine or rainfall, when this is the only source of water supply, one is, of course, helpless. However, under favorable conditions of soil, of light, warmth and moisture, the quality of vegetables can be fairly controlled by judicious regulation of the amounts and kinds of plantfood supplied.

VISITING THE EXPOSITION

(Continued from Page 681)

day the 25th is San Joaquin Valley Day. It is expected that the entire valley will forget all its duties and fill the grounds. The National Association of Real Estate Exchanges and Brooklyn also fill the same day. Buffalo Day is the 27th, while the 28th is given over to Florida and National Association of Piano merchants. June 30 is Arizona, also Phoenix and Salt Lake Valley and Prescott special days. The 30th and 31st are given over to the Swiss people, to manufacturers, to track and field athletics.

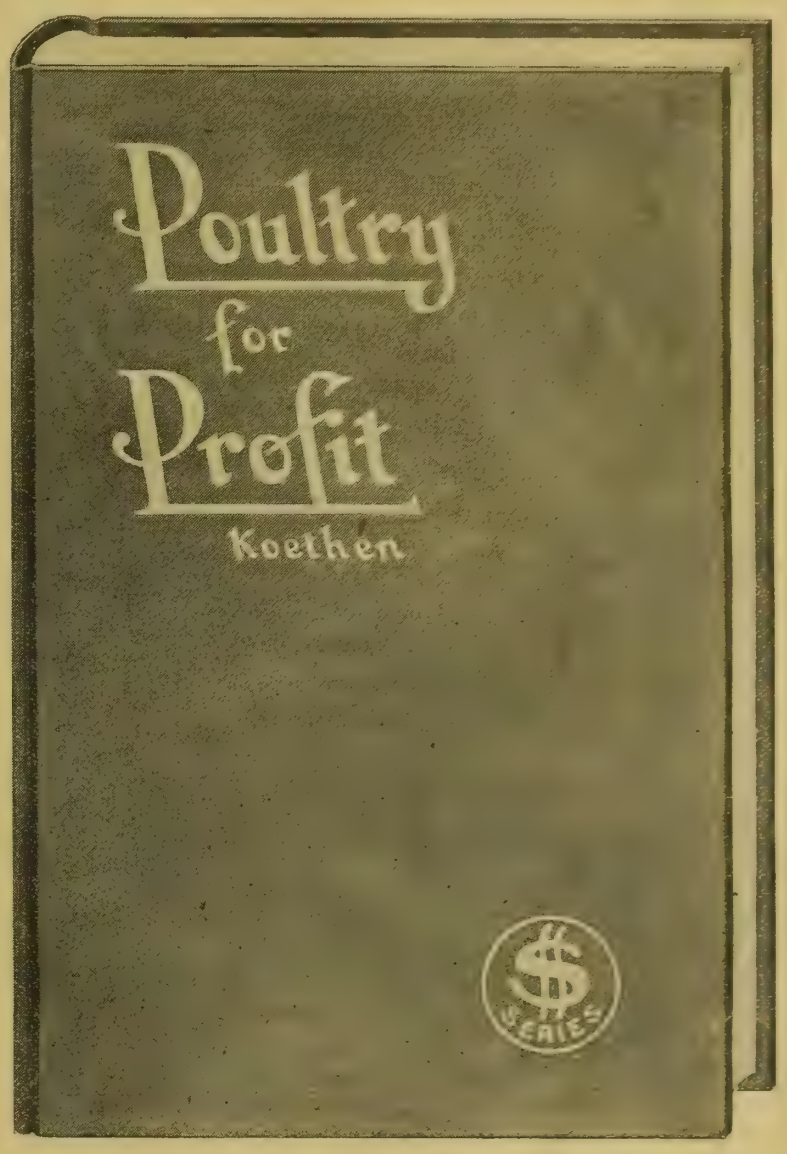
to make the

Poultry Business

a

Profitable Business

requires a thorough knowledge and practice of the many details connected with Poultry Raising.



the Cultivator Poultry Book

Poultry for Profit

by

Jean A. Koethen, Graduate of University of California

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information——

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

$1.00 Postpaid to any address.

$1.75 with the California Cultivator, weekly, one year.

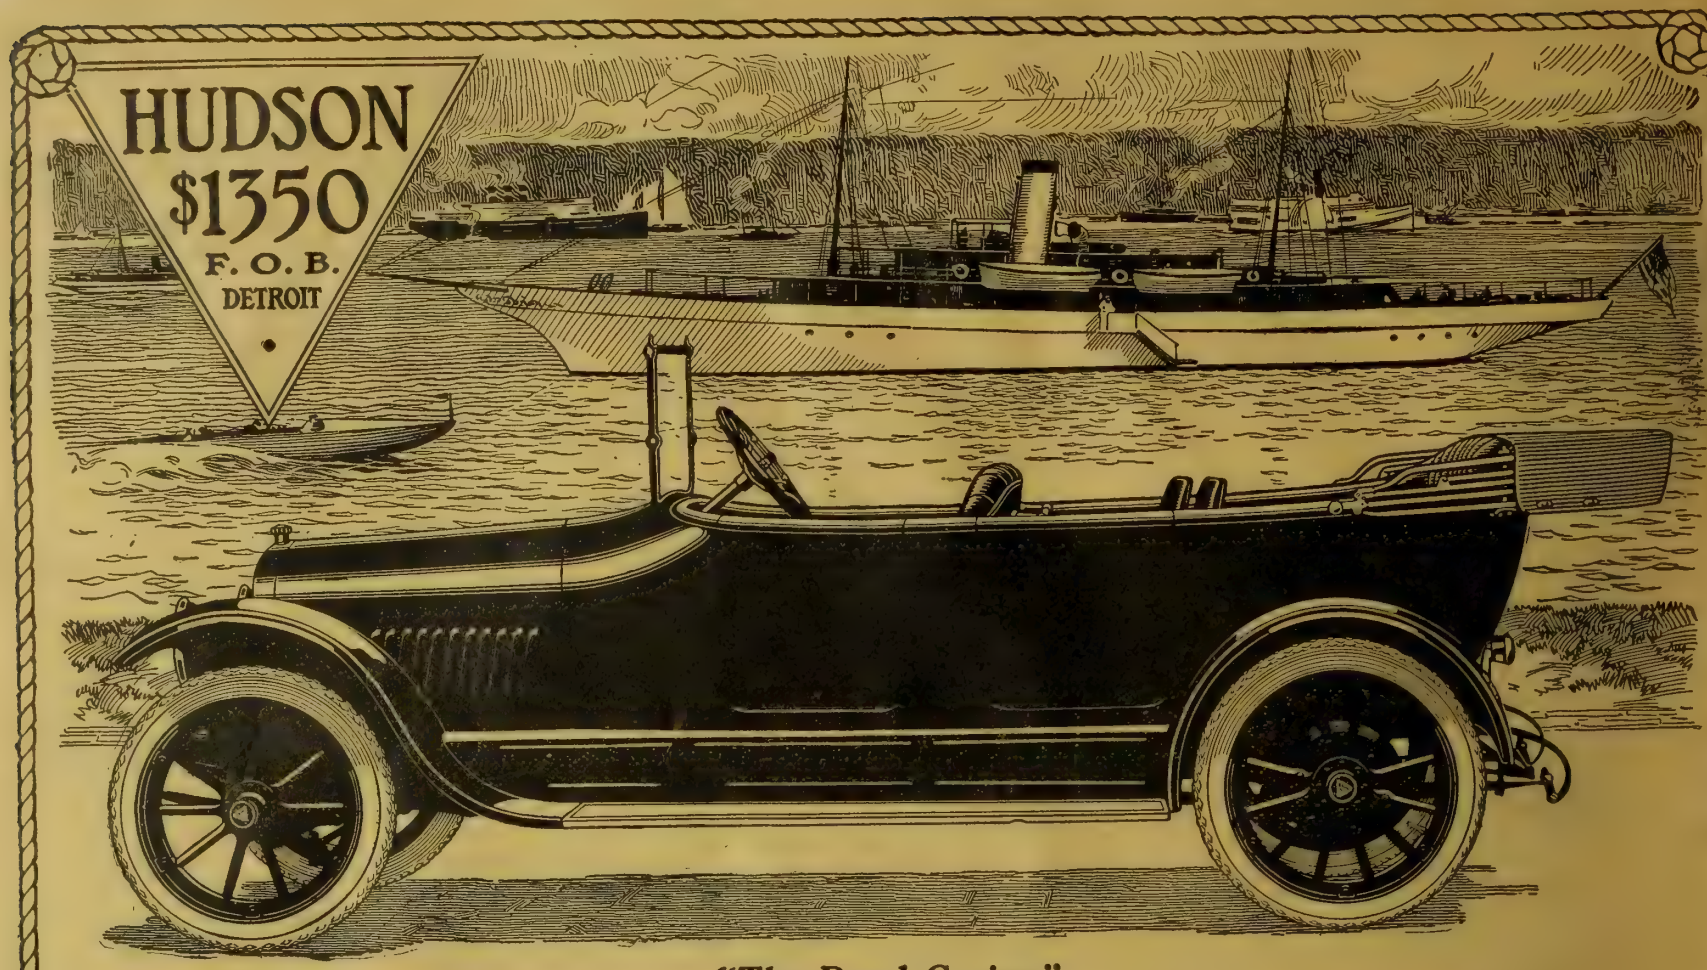
115-117 N. Broadway *Los Angeles, Cal.*



"The Road Cruiser"

Ready—the 1916 Hudson

This is to announce the 1916 HUDSON—the third model of this new-type HUDSON, which has become the most popular class car of the day.

It is 20 months since this new-type HUDSON came out at $1750. It weighed about one-third less than average old-time Sixes. It cut tire and fuel cost in two. It had ample power, ample room for seven. It has proved itself one of the staunchest cars ever built. Despite its low price, it excelled in [illegible] costly cars of that day. [illegible] is due to better materials, better designing, to refinement in place of crudity.

This HUDSON became instantly popular. It took us one year to catch up with our orders. It forced us to treble our output. Repeatedly it attained a sale of a million dollars weekly.

In the past 20 months, 15,000 men have bought it. After two seasons with it they unite in pronouncing it the ideal modern car.

Now we announce improvements, in some respects the greatest HUDSON ever made. And one at least will be the most welcome innovation of the year—the new Ever-Lustre finish.

Now a $1350 Price

The first price on this new type was $1750. That was late in 1913. It startled Motordom. This was the first quality Six to sell under $2000, and many engineers said that price was impossible on a car of HUDSON quality. And they said our lightness—under 3000 pounds—was incompatible with strength.

Four Innovations

1—Yacht-Line Body
2—Ever-Lustre Finish
3—Roomier Tonneau
4—$200 Reduction

But the car was a HUDSON, and HUDSON standards are high. Howard E. Coffin was the designer, and he never had made a mistake. So men flocked to this car in such numbers that our next model, with 31 improvements, could be sold for $1550.

Now, with a trebled output, we offer another $200 reduction. And that on a new model, vastly improved. That means $400 reduction—23 per cent—since this new type first came out at a price pronounced impossible.

Yacht-Line Body

And now comes the Yacht-Line body, a seven-year evolution. From straight lines we came to streamline. Now come lines so graceful and unbroken that we call them Yacht-Lines, and the car has been called "The Road Cruiser."

Even the door lines are unbroken. The tops of both the doors and the body are leather bound.

The tonneau is roomier, the rear seat is wider. Now three big people are comfortable on it. With seven in the car, nobody is crowded, and the two extra tonneau seats disappear when not wanted, doubling the tonneau room.

And now comes enameled leather upholstery over deep curled hair—a luxury which heretofore has been confined to costlier cars.

Ever-Lustre Finish

And now, best of all, comes a finish that stays new. We have built in our factory enormous ovens, large enough for hundreds of bodies. Now each coat of finish is forced on, then baked on. The result is a finish brilliant, deep and enduring. It resists weather, washing, rubbing, mud. You who have seen good cars quickly grow shabby will realize what this finish means.

Note that these advances come to you in a $1350 HUDSON. And note that this HUDSON, by keeping so far ahead, is winning by thousands men who demand the best. Wherever you go you will see this new-type HUDSON driven by men of distinction, men who know cars, old, experienced motorists. And this new model will undoubtedly win 20,000 more.

Go see it now. Most HUDSON dealers have it. And this, like every new-model HUDSON, is bound to be oversold. Last summer, thousands of buyers waited weeks for their HUDSON. This summer, despite our larger output, there will be waiting for those who delay. And you won't find a car for second choice anywhere near so attractive.

7-Passenger Phaeton or 3-Passenger Roadster, $1350, f. o. b. Detroit
Also a new Cabriolet, $1650, f. o. b. Detroit

CYANEGG FOR FUMIGATION R&HCCo TRADE MARK

ON THE DECAY OF ORANGES WHILE IN TRANSIT FROM CALIFORNIA

G. Harold Powell says:

(**Extracts** from Bulletin No. 123 of U. S. Dept. of Agriculture, Bureau of Plant Industry.)

CYANEGG FOR FUMIGATION R&HCCo TRADE MARK

"The work of three years has shown that the orange as it comes from the tree in sound condition seldom develops decay and that brushing, washing, and the mechanical injury of the fruit in handling are followed by more or less loss, the greatest decay developing in the mechanically injured oranges. . . . an apparently sound orange when it comes from the tree shows greater resistance to decay than the same fruit after it has been handled in different ways, that the fruit showing visible mechanical injury as the result of handling develops the maximum decay, and that the brushing and washing of sound oranges is more or less detrimental to their keeping quality . . . The packing house tests indicate that an orange with a sound skin is not more likely to decay when grown in the coast region than a similar orange grown in other parts of the orange belt and that a similar line of handling produces similar results in the different regions. . . . in groves that are well fumigated the fruit is practically free from the sooty-mold fungus. . . . Oranges are washed primarily to remove the sooty-mold fungus that grows in the so-called honeydew exuded by the black scale. . . . When the present investigation by the Bureau of Plant Industry was undertaken, from one-third to one-half of the oranges of California were washed, practically all of the fruit in some sections being treated in this way, especially where the growers had been overconfident in the parasite 'Scutellista cyanea' or in the use of oil sprays as means of holding the black scale in check. . . . The necessity for washing the orange should be avoided by a proper fumigation of the groves with cyanide" (this of course means fumigation with hydrocyanic acid generated from cyanide). "Fumigation, on the other hand, is one of the operations that promotes good orchard management; it maintains strong, healthy trees and fruit, and it reduces the cost of preparing the oranges for market in a manner that increases the keeping quality of the fruit."

In Bulletin No. 63, of the U. S. Department of Agriculture, Bureau of Plant Industry, by A. V. Stubenrauch, under the heading INFLUENCE OF CLEANING OPERATIONS UPON DECAY, appears the following:

"Washing is perhaps the severest treatment that can be given to citrus fruits, and wherever it is not absolutely necessary in order to render the fruit marketable it should be omitted."

"CYANOFUMER"

(Trade Mark)

(Patents Applied For)

Process for the Generation of

Hydrocyanic Acid Gas

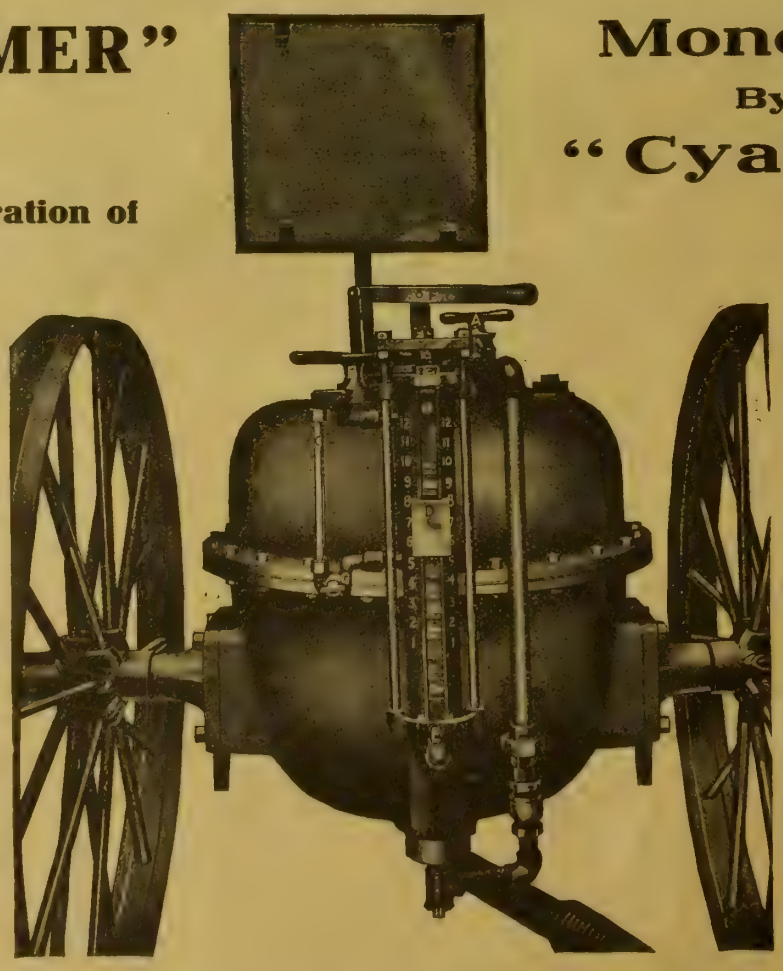
AND

Mechanical Device

for Applying the Process in Practical Fumigation Operations

The "CYANOFUMER" (Process and Mechanical Device) while new is fully proven and we are prepared to establish the correctness of every claim which we make in its behalf.

The "CYANOFUMER" generates and delivers Pure Hydrocyanic Acid Gas to the tents and does it with satisfactory uniformity, one charge with another.



Money Saved

By Using the

"Cyanofumer"

(Trade Mark)

It eliminates waste.
It insures accurate Dosage.
It produces perfect chemical reaction.
It generates pure Hydrocyanic Acid Gas.
It delivers the pure gas under the tent.
It removes risk of gas condensation.
It stops loss of gas by absorption.
It solves the problem of normal tent leakage.
It increases fumigation efficiency.
It saves time and labor.
It prevents acid burning of tents.

For further particulars address:

The Braun Corporation

363-371 New High St.
Los Angeles, Calif.

THE CITRUS FRUIT GROWER SHOULD INSIST UPON HAVING HIS TREES FUMIGATED WITH HYDROCYANIC ACID GAS, GENERATED IN AND DELIVERED BY THE "CYANOFUMER."

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIV No. 25 LOS ANGELES: THURSDAY, JUNE 24, 1915 One Dollar Yearly

Relation of a Permanent Agriculture to Social Welfare

By Thomas Forsyth Hunt Before the Annual Convention of National Real Estate Exchanges at Los Angeles

IN the short time at my disposal I propose to support the following propositions:

American farms must be recapitalized at least three times in a century.

Young men are born into the world with their clothes off. They are without capital.

The open country cannot afford to support numerous social, religious or racial divisions.

The country population of one generation determines the character of the city population in the next generation.

Land credit, popularly known as rural credit, is a means of creating a permanent agriculture by putting farm mortgages on an investment basis.

On preliminary observation, wealth and welfare are not synonymous terms. There is a great deal of wealth invested in diamonds, but diamonds cause very little welfare. In this discussion we are interested primarily not in the wealth, but in the welfare of society.

In San Francisco there is a furniture store that has been in existence since the early '50s. How many farms can you recall that have been under the same management since 1860? A corporation is endowed with the capacity for succession. A farm enterprise is dependent upon the life of a single individual.

This National Association of Real Estate Exchanges represents a conscious effort to settle America. The one thing I wish to drive home to this audience is, that after the land is occupied you are not through with the problem. The one undeniable, unescapable, inevitable condition is, that the farms of the United States must be recapitalized at least three times in a century. This problem of recapitalizing the farm has been met in at least 14 countries, but it has not yet been met in the United States.

Young men are born into the world with their clothes off. Few are born with a gold or even a silver spoon in their mouths. Those who inherit money seldom do so at the age of 21. There are in this country today approximately 1,000,000 young men between the ages of 18 and 22 inclusive who will eventually occupy farms of the United States. Moreover there are 1,000,000 young women who are going to live with them and rear families. The farm is no place for a bachelor. All this is so unless the number of farms decrease or they are cultivated in the future by foreigners.

How are these young men to secure the $6,000,000,000 worth of capital required to possess a million farms? Whence will come the money to furnish the homes so that these young mothers may have the ordinary comforts of life? When 160 acres of fertile land could be obtained free we did not need to ask these questions. Now they are the most serious questions before the American people.

From the institution with which I am connected, there were graduated last year 66 men who had studied agriculture. Only 22 per cent of these men had any farm, expected to inherit a farm or to inherit any money with which to buy a farm. The average farm in this state is worth more than $16,000. How are these young men to get the capital or the credit with which to secure an average California farm? What is the use of educating young men in the practice of agriculture if they cannot practice it? It is all very well to say that they should go to work and earn the money to buy a farm. Indeed that is just what happens. For want of capital they go to work on a salary and if they ever earn enough money to buy a farm they have reached an earning capacity that it is unwise to sacrifice and what is more important they have reached a time of life when it is not advantageous either for their families or society that they should begin farming. Popular tradition to the contrary, notwithstanding, the farm is not a place to return to after a successful business life, but rather a place to retire from after rearing a successful family.

Dr. Warren of Cornell University has pointed out that in Southeastern United States the land is held at a lower price because two races occupy the land, necessitating two sets of social institutions. This greater overhead charge makes the land less valuable. In the large cities the people subdivide and stratify without special inconvenience. To see how beautifully it works one needs only to cross the Hudson River or San Francisco Bay by ferry at different hours of the day. Crossing at a certain morning hour you will find scarcely a person with a daily paper. Those who smoke, smoke a pipe. Later in the day nearly every man carries a paper and if he smokes it is generally a cigar. Each class goes back and forth over exactly the same channel scarcely conscious of the other's existence and wholly without being in the slightest degree discommoded. It is a sample of the hundreds of ways in which people stratify in cities. Nor is there any criticism to be offered of the methods in vogue although at times there may be certain manifestations which cannot be commended. In the open country such stratifications are for physical and economic reasons impossible. In the city, without any apparent impropriety, you may not associate with the gentleman in the adjoining apartment because you do not fancy the way he trims his beard, but in the country you must associate with the man on the next farm even though he is constitutionally opposed to the use of a bath tub.

The Culture of Tomatoes in California

Written for the California Cultivator by S. S. Rogers

THE tomato or love apple originated in Peru and was first named by botanists in the 16th century. It was not however before the following century that this vegetable was in general use. At this time it was considered poisonous which probably accounts for its very slow progress in becoming popular. During 1812 tomatoes were first quoted in the American markets, and the seedsmen first began to sell seed in 1818. After 1835 the demand increased rapidly until at the present time the tomato is considered one of the most healthful vegetables grown.

Importance in California

California is especially favorable for the production of this crop, both as a fresh vegetable and as a canned product. During 1906 there were over a million cases of tomatoes packed in this state, which made California rank third in the United States in this respect.

In 1907 California stood second with a pack of 1,284,000. During the season of 1913 there were 1,490,000 cases grown and packed in this state. Aside from the production of tomatoes for the cannery there is a large acreage devoted to raising tomatoes for the fresh market; the average planting in California for Eastern shipment alone amounting to approximately 2000 acres per year, with several hundred more acres grown for the local marketss. Tomatoes are grown in a large number of counties throughout the state but the centers of the industry are located in Los Angeles, Orange and Alameda Counties and in certain portions of the Sacramento and San Joaquin Valleys.

Yields

When growing for the cannery yields of 15, 20 and accasionally 25 tons per acre are secured. Of the 10,000 acres grown for the canning industry in this state the average production is between eight and ten tons per acre. When producing this crop for the market under proper conditions a grower should expect from five to eight tons per acre and occasionally as high as from ten to 15 tons are obtained.

Cost of Production and Prices Received

The average cost of producing one acre of tomatoes will vary from $25 to $45 per acre, with the average cost from $32 to $40 per acre. The average price for tomatoes when growing for the canneries varies from $6.00 to $8.00 per ton, while the prices received on the market vary from $10 to $40 per ton, with the average price from $15 to $25.

Cultural Requirements

Tomatoes are grown on soils varying from coarse gravel to heavy adobe. As a rule larger yields are produced when growing on soils which are not too rich in plant food and which do not contain too much water, for if the soil is over abundant in nitrogen there is liable to be a too luxuriant vine growth at the expense of the yield. In the miscellaneous vegetable garden tomatoes should be planted on the lighter classes of soils, especially when producing an early spring crop; the best type of soil being a sandy loam underlaid at a depth of three to five feet with a heavy loam. As the tomato is a very deep-rooted vegetable it is not adapted to shallow soils. Tomatoes are tender and are injured by a low temperature at which many of the other vegetables, such as onions, cabbage, etc., will thrive. This crop will stand the heat much better than cold, especially when the quantity of moisture is adequate.

Preparation of Soil

Soil which is to be planted to tomatoes in the spring should be fall plowed if possible. At this time the plowing should be 12 to 15 inches deep. The field may either be left in this rough condition or worked down immediately and left in a fine condition of tilth during the winter, but under ordinary conditions the former method is preferred. A short time before the field is to be planted in the spring it should be replowed to a depth of eight to ten inches and pulverized as finely as possible with the various farm implements. At the desired time of planting the field should be marked off, showing the location of the rows of plants.

Planting

Tomatoes are grown by sowing the seed in seed beds and transplanting the young plants into the field. The grower should use a hot bed during the early spring months, but later can produce plants by the use of a cold frame or by planting directly in the open. At the time of transplanting the plants should be about six to ten inches in height, stocky and free from disease. When growing an early spring crop the plants are usually set in the field at distances of 6 by 6 or 6 by 8. When growing for the cannery or the midsummer crop, which often produces a larger vine growth than the early planting, 7 by 8 or 8 by 8 is the usual distance. During the early spring when there is an abundance of moisture in the soil it is not customary to irrigate the plants at the time of setting them out, but later in the season furrows from four to six inches deep should be made down which the water is run and along which the plants are set.

Irrigating

The number of irigations which the field should receive depends wholly upon the season of growth and character of the soil. The plants should never be allowed to suffer for water, and irrigation should be timed so that an optimum of moisture will be present throughout the season. Under ordinary conditions when growing this crop during the spring or summer months the plants are irrigated once or twice soon after planting and until they have commenced to bloom. During this period irrigation should be discontinued until after the fruit is about the size of a walnut, and water should not be put on after the fruit has commenced to turn in color. The water is applied in furrows between the rows, near enough to them so that the plants will get the benefit of the irrigation but not so close that their roots will be injured by making the furrows.

Cultivation

After the plants have recovered from their transplanting the field should be carefully gone over, stirring the soil as deep as possible in the middle of the rows, but care should be taken not to come to close to the plants. If irrigation was used at the time of planting the furrows should be thoroughly covered and the soil stirred to prevent cracking. The sub sequent care of the field depends largely upon the local conditions but it should be cultivated often enough to keep the weed growth in check and to preserve a fine mulch on the surface. If the field has been carefully cultivated while the plants were young this operation can be done away with after the vines have reached maturity, for they should not be disturbed any more than possible at this time. Under ordinary conditions one or two hand hoe ings will be found sufficient during the season. It is important that the field be thoroughly cultivated after each irrigation.

Harvesting

The exact time and manner of harvesting depends largely upon the markets to which the crop is to be shipped. Tomatoes that are to be shipped to long distance markets are usually picked just as they are turning red in color, while those used for local consumption may be colored fairly highly

Citrus and Tropical Fruits

MARMALADE AND JELLY FROM CITRUS FRUITS

Written for California Cultivator
By Professor W. V. Cruess, University of California

OF THE citrus products easily made in the kitchen citrus fruit marmalades and jellies are among the most attractive. Unfortunately the standard recipes for citrus fruit jellies call for the use of meat gelatin to give the jellying property and only a mere trace of citrus fruit is used to give flavor. One such recipe required about half an orange and half a lemon to give the same quantity of jelly that would require six oranges and three lemons if a pure citrus fruit jelly were made.

The advantage to the grower of teaching the housewife to make the pure orange-lemon jelly is at once apparent. The wholesomeness and nutritive value of the pure jelly is also greatly superior to the gelatin made article. Therefore it is of advantage to the housewife and the grower to make pure jelly. It might be well to make the suggestion that packing houses spread the recipes given in this article or similar tried recipes among the users of oranges. Ways of disseminating this information will suggest themselves to those concerned.

Citrus fruits, and especially lemons, contain large amounts of pectin, the substance which gives a jelly consistency to jellies and marmalades. This pectin is situated principally in the white portion of the skins and in the fibrous tissue of the mesh of the orange. The skin contains most of this substance; therefore in order to successfully make marmalade or jelly the skins must be included when the fruit is boiled with water to get a pectin solution. The pectin is practically insoluble in cold water or juice but dissolves readily in boiling water; these facts explain the necessity of heating any fruit before pressing out the juice for jelly making.

To cause the pectin to jelly a certain quantity of fruit acid must be present. Ripe oranges do not contain quite enough of this under ordinary conditions; hence it becomes necessary to make up this deficiency by mixing the oranges with lemons. About three lemons to six oranges will be the correct ratio.

A third necessary constituent of jellies and marmalades is sugar. The sugar is necessary to cause the pectin to jelly and must also be in sufficient quantity to act as an antiseptic to prevent molding. This will be about 65 per cent sugar. Sugar testers are available at about 75 cents each. These are either Baume or Brix testers. Sixty-five per cent sugar is equal to 65 per cent Brix or to 35 degrees Baume. These figures refer to tests made when the juice or syrup is at room temperature. If made while the jelly or marmalade is boiling or almost boiling hot, the testers would indicate less than 65 per cent and 35 degrees respectively, and the readings would then become 57 per cent Brix or 31 degrees Baume. That is to say, when a pectin extract from boiled fruit is mixed with sugar and boiled to the proper jellying point, a Brix sugar tester will indicate 57 per cent and a Baume will test 31 degrees if the hot juice is used for the test.

A simpler method is to test the boiling point of the mixed sugar and juice. When the proper point is reached the liquid will boil at nine degrees Fahrenheit above the boiling point of water for any given locality. If water boils at 212 degrees Fahrenheit at a given place, then the jelly or marmalade when ready to pour into glasses will boil at 221 degrees Fahrenheit. Thus it is only necessary to heat water to boiling, insert a thermometer till the mercury stops rising, heat the solution and sugar until the thermometer will read nine degrees Fahrenheit above the boiling point of water.

Where a thermometer or sugar tester is not available the mixture of juice and sugar may be boiled until the liquid will congeal or "sheet" from the edge of a large cookspoon dipped in the boiling solution and held above the pot or kettle. Ordinarily from one to one and a half parts sugar are added to each part of pectin before beginning the boiling.

One and one-fourth pints sugar to each pint citrus fruit pectin solution has been found satisfactory.

Jelly or marmalade must be clear to be attractive. The common method of obtaining a clear jelly is to observe the following rules: Cut the fruit in medium slices; add water and boil until soft but not until the fruit becomes mushy or broken; drain through a bag without pressure; strain liquid through a jely bag till clear. It can then be used for jelly.

A more convenient way is to slice the fruit; add water; boil till soft; press out as much of hot juice through coarse bag as possible; and let juice settle for 24 hours in jars or bottles; decant off clear liquid for jelly or marmalade. This method works very satisfactorily.

A marmalade is a clear jelly with a few thin slices of orange or lemon or grapefruit peel suspended in the jelly. It should not be a thick jam of skins and pulp.

The following recipes for marmalade and jelly have been developed recently and found to give excellent results.

Orange Marmalade Recipe

Use six oranges and three lemons. Slice one and one-half oranges very thin and barely cover with water. Boil till soft, replacing water that boils off. Cut the remaining four and one-half oranges and three lemons into small pieces. Cover with water. Boil 45 minutes, replacing from time to time the water that boils off. Press out the hot juice and add the hot juice from the first one and one-half oranges. Let the juice stand 24 hours to settle. Retain the thinly sliced one and one-half oranges. Decant or siphon off settled juice from sediment and strain the sediment through a jelly bag till clear, or simply discard the sediment. Add to the clear juice the thinly sliced boiled orange prepared the previous day. Add one pint sugar to each pint juice. Boil slowly until the mixture reaches nine degrees Fahrenheit above boiling point of water or until it will "sheet" from a spoon.

Use whole fruit including skins throughout.

Grapefruit Marmalade

Substitute the word "grapefruit" for "orange" in above recipe.

Orange Jelly Recipe No. 1

This recipe was worked out by Miss Essie Elliott of the Covina high school domestic science department. Use six oranges and three lemons. Remove and discard the thin outer layer of rind, leaving white portion of rind on fruit. Remove the white portion of rind and tie it in a close mesh bag. Shred the remainder of the lemons and oranges very fine and add three times their bulk of water. Boil hard 45 mintes with the bag of white rind immersed in the liquid. This furnishes the pectin. Skim frequently. Remove bag and throw contents away. Strain off six glasses clear liquid and let pulp (which should stil have some liquid left on it) and clear juice stand 24 hours. Carefully decant or syphon off clear liquid from each and combine. Boil ten minutes. Add equal quantity of sugar and boil till it jellies (about five minutes. When the liquid "sheets" from a spoon, it is jellied.

Those who do not object to the flavor of the yellow portion of the rind may leave it on. The sediment from the settled juice will also make jelly, but will be opaque.

Orange Jelly Recipe No. 2

Use six oranges and three lemons. Do not remove any part of peel, but use the whole fruit. Cut into small pieces. Cover with water. Boil 45 to 60 minutes, replacing from time to time the water that evaporates. Press hot through coarse mesh bag. Allow juice to settle 24 hours. Decant off or syphon off the clear liquid. Add one and one-fourth pints sugar to each pint of juice. Boil with frequent skimming until the liquid will sheet from a spoon. Pour into glasses.

Or the liquid may be boiled until it boils nine degrees Fahrenheit above the boiling point of water.

Grapefruit Jelly

Proceed as with orange jelly.

Lemon Jelly

Press out most of juice, leaving about one-fourth of the juice of the fruit in the pulp and skins, or press out all the juice and return one-fourth of it to the peels. Cover peels with water. Boil 60 minutes or more, replacing from time to time water that boils off. Press out hot juice. Let settle 24 hours; decant or syphon off the settled liquid. Add one and one-fourth pints sugar to each pint juice and boil till liquid will sheet from a spoon.

Flavoring the Jelly

After the jelly has been boiled and is ready to pour into glasses, it may be allowed to cool for about five minutes and then can be flavored with a little lemon or orange extract or oil. This may be needed because the boiling of the fruit to extract the pectin drives off most of the flavoring matters of the fruit and leaves the juice rather "flat."

Effect of Ripeness of Fruit On Flavor

Oranges of the first two weeks or first month of the season will give a bitter jelly and marmalade; hence if this is to be avoided, fruit gathered well after the start of the picking season must be used. Such fruit will not give a bitter taste.

New Quarantine Order

DR. A. J. COOK, state horticultural commissioner, held a meeting at the office of the Los Angeles County horticultural commissioner in the Hall of Records on Friday to confer with the nurserymen and the county commissioners regarding steps to be taken to put into operation the amendment to the enabling act for state horticultural commissioners which was passed at the last session of the legislature. This amendment gives to the state commissioner sole power to establish quarantine areas for horticultural products within the state and enables him to formulate rules for their maintenance, thus making the inspection requirement for these goods much more uniform in the different counties. After much discussion the following rules were adopted, subject to approval by the attorney general of the state.

State Quarantine Order

Section 1. No person or persons, firm or corporation, shall receive, bring or cause to be brought into one county of the state of California from another county or section of a county, nor plant, sell or give away any trees, vines, scions, cuttings, grafts, plants or any other horticultural materials or equipment subject to inspection without giving notice within 24 hours after their arrival at their destination, to the county horticultural commissioner, his deputy or an inspector who shall release them, after inspection and disinfection, as hereinafter provided. Notification of the arrival of interestate shipments is provided for in section 1 of the state quarantine law.

Section 2. No person or persons or dealer in nursery stock shall be allowed to sell or deliver, or cause to be delivered, any trees, plants, shrubs, vines, cuttings, grafts or other articles of horticulture from a county or section of a county known to contain new or extremely dangerous and not commonly distributed insect or animal pests, fungous or other plant diseases for which there is no known means of eradication, when such trees, plants, vines, cuttings, grafts or other articles of horticulture or horticultural equipment are known to be hosts for any of these dangerous pests, into a county or section of a county which upon inspection is found to be apparently free from such dangerous insect or animal pests or fungous or other incurable plant diseases. The state commissioner of horticulture through his deputies and the county horticultural commissioners, shall determine what pests are of limited distribution and of such a dangerous character as to demand quarantine under this section, and shall fix as nearly as possible, the exact areas over which they occur. Such areas shall be designated as quarantine districts, and shall consist of one or more counties, one or more townships within a county or counties, or smaller divisions at the discretion of the state commissioner of horticulture. A complete list of all such districts formed, together with the pest or pests, or fungous or other plant diseases occurring within each district, must be furnished to all county horticultural commissioners, their deputies and inspectors, and all nurserymen and others requesting them.

Section 3. For the further protection of the fruit growers of any county against the introduction of injurious insect or animal pests, or fungous or other plant diseases of any trees, plants, shrubs, vines, cuttings, grafts or other articles of horticulture, the state commissioner of horticulture, or under his direction his deputies, the county horticultural commissioners, their deputies and inspectors, shall require such treatment of the aforementioned horticultural materials or articles while growing in the nursery, orchard or elsewhere, or after being dug and before shipment, as it is deemed necessary for the protection of the horticultural industry from pests or diseases that are known to be present on such articles. The county horticultural commissioner, his deputy or inspectors may require such treatment at the point of delivery as is deemed necessary after an inspection has been made and revealed the presence of live insects or animal pests, fungous or other plant diseases. If in the judgment of the state commissioner of horticulture the infestation is so serious as to make treatment ineffective or impracticable, or if pests are present that cannot be controlled by known remedies, the shipment shall be returned to the consignor or destroyed within 48 hours, it being optional with the consignor as to which course is pursued, provided that the nature of the pest is not such as to cause immediate danger, or danger in transit, in either case of which the stock shall be imediately destroyed. Any expense occasioned by the treatment of infested stock must be paid by the consignor. In cases of infestation of crown gall, olive knot, root knot and other serious and incurable diseases the infested trees shall be destroyed.

Whenever a [illegible] commissioner of horticulture may deem it necessary for the safety of the horticultural in-

John Deere Farm Implements

John Deere Implements

John Deere Motor Press

The Press with the powerful eccentric gears. Gears are mounted off center, giving more power on the working stroke, a quicker return of plunger and very desirable action of the self-feed — the three points of prime importance.

Easily bales 2 to 4 tons per hour without any jar or shock.

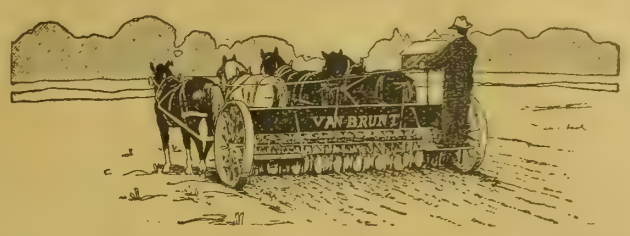
Powerful self-feed arm and plunger, improved form of drop blocker and automatic tucker insure well shaped, firmly packed, smooth end bales,—the kind that bring the highest price.

Entire outfit is always ready for work. No lining up of engine required.

Wide track front axles with a fifth wheel is why this press stands up so well and is so easily moved.

Made in three sizes for 14x18, 16x18 and 18x22" bales.

Write if interested in Hay Press, Loader, Stacker, Side Delivery Rake or other hay tools—and ask for free book, "Better Hay—How to Make and Market It".



Van Brunt Single Disc Grain Drills

Plant any small grain, from alfalfa to bearded oats, corn and peas, even in trash, gumbo or mud.

Van Brunt Drills never choke. Adjustable gate force feed compels an even, continuous flow through each seed tube. Amount sown regulated simply by moving a lever.

Seed is planted at even depth. Individually adjustable springs enable you to give each furrow opener the required pressure for hard or soft ground to make furrows of even depth, and the seed is placed at the bottom of the furrows. All of the grain is up and ready for harvest at the same time.

Van Brunt Drills are light weight, light draft, well balanced and strong. Frame is rigid; hopper does not sag; the gear drive is positive (each wheel drives half the feeds) and the disc bearings are guaranteed to last lifetime of drill. Spring steel scrapers keep the discs clean.

Write us for free booklet, "John Deere-Van Brunt Single Disc Drills." It tells why the Van Brunt plants seed at bottom of furrows of uniform depth, and what this means to you.

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X-111

JOHN DEERE MOLINE, ILL.
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

John Deere Publicity Department, Moline, Illinois

Opening of

Leffingwell Heights

LEMON LAND

Here's your opportunity to buy real choice Lemon Land, in the highly favored Whittier-La Habra citrus belt. This fine rich land adjoins the famous Leffingwell Grove, that in 1913—the year of the big freeze—yielded a lemon crop of over $500 net profit per acre. This was in 1913, the test that distinguished the real from the so-called Lemon Land.

Why take chances with far out, exposed lands, when you can get your choice of the cream of sheltered lemon lands at the opening price of $500 per acre (net acreage) with ample water, delivered to highest corner on each tract.

Leffingwell Heights lies in a beautiful valley, sheltered against harsh winds, by the Puente Hills. Only 16 miles to Seventh and Broadway, the heart of Los Angeles, via Whittier Boulevard, Pacific Electric or main line Santa Fe Railway.

Here's YOUR opening to break away from your limited and uncertain income. Get five or ten acres of this choice land now at the opening price. Have it set to lemons, avocados or valencia oranges and get a good income for life.

Automobile excursions every morning at ten o'clock. Write, phone or call and make reservations.

terests of a county he may hold for subsequent inspection or disinfection, or both, any of the articles mentioned in section 1, for such time as he may deem advisable.

Section 4. The county horticultural commissioner of any county shall under the direction of the state commissioner of horticulture require at stated times the registration at his office of all nursery owners and dealers in nursery stock within his county, requiring data on acreage, variety, number of trees, locality where stock is grown, and anything else which he may deem necessary. No fee shall be charged for this registration.

Section 5. Every person, firm or corporation doing public spraying or fumigation work must obtain a permit to do such work from the county board of supervisors of the county within which operations are to be carried on. Such permit shall be recommended by the county horticultural commissioner and approved by the state commissioner after an examination of the spraying or fumigation apparatus to be used has been made and found to be in good order, and the applicant is known to possess sufficient knowledge of the work that he intends to do, to enable him to carry it on intelligently and successfully. Inspection of all apparatus shall be made by the county horticultural commissioner at such times as he may deem necessary and it shall be his duty to require it kept in efficient working order. Reports of the kinds and amounts of materials and method used in the work of public spraying and fumigation being done by any person, firm or corporation, shall be made to the county horticultural commissioner at stipulated times, and refusal or failure to make a report, to repair apparatus when reported faulty, or to do the work in the manner prescribed by the commissioner shall be considered sufficient cause for the revocation of the permit.

Section 6. No person or persons, firm or corporation shall buy, sell or give away any potatoes to be used for seed purposes or as owner, agent or renter of land, shall plant, or allow to be planted in any county of the state of California, any potatoes infested with eel worm, Heterodera radicicola, or tuber moth, Phthorimea operculella, rhizoctonia, fusarium, scab or other fungous diseases, and for the purpose of inspecting seed potatoes intended for planting in any county, the county horticultural commissioner of the county, his deputy or local inspector working under his direction, may enter into any premises where potatoes are kept, and such person or persons, or other custodian of such potatoes shall point out to such commissioner or local inspector, all potatoes in his possession known by him to be intended for seed, and if on examination they are found to contain eel worm, tuber moth, rhizoctonia, fusarium, scab or other fungous diseases, notice will be served in writing on the owner, agent or renter of said premises, prohibiting the planting of such infected potatoes, provided that seed infested with rhizoctonia, scab or other curable affections, if treated, may be planted.

Section 7. No trees, plants, vines, shrubs, cuttings, or other horticultural materials and equipment shall be accepted for transportation except when accompanied by a certificate of inspection signed by the state horticultural commissioner, or a county horticultural commissioner, deputy or inspector or quarantine officer, such certificate indicating the condition of the stock relative to disease and insect pests, and each carload, case, box, package, crate, bale or bundle of trees, shrubs plants, vines, cuttings, grafts, scions, buds, fruit pits, or fruit or vegetables or seed subject to inspection brought into a county or section from another county or section shall have plainly and legibly marked thereon in a conspicuous manner and place the name and address of the shipper, owner or owners or person forwarding or shipping the same, and also the name of the person, firm or corporation to whom the same is forwarded or shipped, or his or its responsible agents, also the name of the county and locality where the contents were grown and a detailed statement of the contents therein, must be sent to the county horticultural commissioner of the county into which the goods are shipped.

FRUIT STANDARDIZATION LAW

One of the bills which means much to the California fruit industry, at least we believe it does, is that affecting standardization. This bill has been duly signed by the governor and will become effective August 7. It authorizes a standard for the packing of fresh fruit for interstate and foreign shipment. All fruit shall be free from insects and fungus disease.

This law applies only to packed fruits, and so-called lug box sales in local markets do not come under its provisions. Regarding the standard required, we quote from the law:

Sec. 5. All cherries packed in boxes or packages shall contain fruit of practically uniform quality and maturity and one variety only, excepting that such boxes or packages may contain more than one variety if such fact be plainly stamped on the outside of the box or package with the words "mixed varieties" with letters one-half inch high. Each box or package shall be stamped on the outside with the minimum weight of contents, and name of variety or varieties.

Sec. 6. Peaches, apricots, pears, plums and prunes shall be of practically uniform size, quality and maturity. When packed in crates, packages or containers made up of two or more sub-containers having sloping sides, for the purpose of ventilation of the fruit therein, the fruit shall not vary in size more than 10 per cent and no layer below the top layer shall contain a greater numerical count than the top layer. Each box, crate, package, container or sub-container shall be stamped upon the outside with the minimum weight of its contents. Each box, crate, package or container, except sub-containers, shall bear in plain letters the name of the variety contained therein. When packed in a box, package or container having perpendicular sides and ends, each box shall contain approximately the same numerical count in each layer; provided, that when peaches are packed in boxes, packages or containers, having perpendicular sides the box, package or container shall also be marked upon the outside of the end thereof in plain figures with the approximate number of peaches in the box, which shall be within four peaches of the true count.

Sec. 7. Grapes packed for table use shall be of uniform quality and maturity and shall be well matured and show a sugar content of not less than 17 per cent Balling's scale, except Emperor, which shall show not less than 16 per cent Balling's scale. Each crate or other package and containers therein shall bear in plain figures the minimum weight of contents. Each crate or package except sub-containers shall be stamped in plain letters with the name of the variety.

Sec. 8. Berries shall be packed in uniform packages of dry quart containing an interior capacity of 67.2 cubic inches, or dry pint containing an interior capacity of 33.6 cubic inches and shall be reasonably uniform in size, quality and maturity throughout the package or container.

Sec. 9. Cantaloupes shall be placed in standard crates 12x12x23½ inches containing 45 cantaloupes of uniform size and maturity. Pony crates 11x 11x23½ inches containing 45 cantaloupes of uniform size and maturity. Jumbo crates 4½x13½x23½ inches containing 12 cantaloupes of uniform size and maturity or containing 15 cantaloupes of uniform size and maturity.

Sec. 10. All boxes, crates, packages or containers of deciduous fruits of the kinds specified in this act, except sub-containers, when packed and offered for sale, or for transportation for sale, shall bear upon them in plain sight and plain letters on the outside the name of the orchard, if any, and the name and postoffice address of the person, firm, company, corporation or organization, who shall have first packed or authorized the packing of the same, also the name of the locality where the fruit is grown.

Sec. 11. In counties having a county horticultural commissioner, it shall be his duty (and the duty of his deputies) acting as inspectors, which

You might just as well wear your harness out on the grindstone as to neglect to oil it. Unoiled harness can't keep its life and strength—can't give you the service it should.

EUREKA HARNESS OIL

keeps your harness in active service. It fills the pores of the leather and protects the fibre against destruction by sweat, dust, moisture and heat—keeps your harness strong, pliable and black. Get your harness dealer to dip your harness occasionally or buy a can and apply it yourself by hand. It is easy, but it pays big.

* * *

Section 12 provides for the securing of inspectors in counties not having horticultural commissioners.

The remainder of the bill refers to its enforcement, repealing other laws in conflict, etc.

FUNGUS TREATMENT OF BLACK SCALE

Some months ago we made reference to the fact that warning was given to citrus orchardists not to depend entirely on a fungus treatment for black scale which it was announced could be applied much cheaper than ordinary methods of spraying or fumigation. Dr. Woodbridge, who was advocating the use of this new method, made a statement regarding its worth from which a quotation was made in a recent Cultivator. Mr. H. S. Smith of the state insectary at Sacramento issued a more general warning that too much dependence should not be placed upon this remedy. Dr. Woodbridge asked for a more thorough investigation than had yet been made and felt sure that if opportunity were granted to him he could show its worth. State Horticultural Commissioner Cook, Commissioner Wood of Los Angeles County and others took up the matter, and this body of representative men issues the following statement:

On Thursday, June 17, the state horticultural commissioner with a number of horticultural scientists from the state university, county horticultural commissioners, and others interested made a trip to the orange and olive groves in the San Gabriel Valley, Glendale and San Fernando districts to ascertain the results of inoculating trees with a fungus claimed to act injuriously on black scale insects. In some citrus districts near the coast such fungus has been noted at times for many years but the benefit resulting from it has never been sufficiently extensive and reliable to be of material aid in scale control.

The following is the report authorized by this delegation, comprising many well known scientists and experts in this branch of knowledge.

We, the undersigned, a committee selected to report on the findings of a delegation called together by the horticultural commissioners of California and the County of Los Angeles for the purpose of investigating the effectiveness of treatment with cultures of a fungus claimed to control black scale (Saissetia oleae), do report as follows:

On June 17, 1915, the delegation, including besides ourselves Dr. A. J. Cook, state horticultural commissioner; J. P. Coy, horticultural commissioner of San Bernardino County; William Wood, horticultural commissioner of Los Angeles County; S. M. Woodbridge, San Bernardino; B. R. Jones, deputy horticultural commissioner, Los Angeles County; D. J. Carpenter, San Diego; J. H. Wright, Riverside; Kenneth McRae, Cucamonga; Mr. Putnam, Inglewood; Dr. A. G. Smith, horticultural inspector Los Angeles County; Bruce Turner, horticultural inspector Los Angeles County, and Mr. Hurdick, Riverside, visited several groves of citrus and olive trees in San Gabriel Valley, Glendale, Pacoima and San Fernando, some of which had been treated with fungus, which, it is claimed has controlled the black scale (Saissetia oleae) and others which had not been so treated, and find no evidence either in the treated or untreated groves that a fungus of any kind has entered into the control of this pest in these districts. No difference was noted between the treated groves and the untreated ones under similar conditions.—Signed—H. J. Quayle, M. S., professor entomology, Riverside citrus experiment station; D. D. Sharpe, horticultural commissioner Riverside County; C. W. Beers, horticultural commissioner Santa Barbara County; H. S. Fawcett, M. S., professor plant pathology, Riverside citrus experiment station; Kent S. Knowlton, horticultural commissioner Kern County; Geo. P. Weldon, deputy state horticultural commissioner.

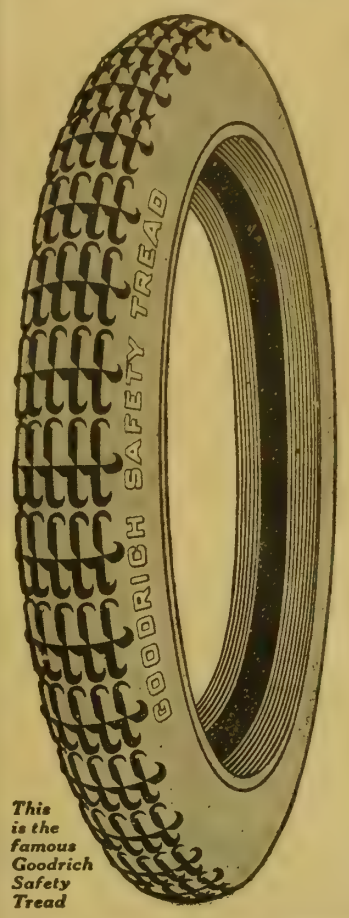
Only 5% PLUS for the Best "Non-Skid"



This is the famous Goodrich Safety Tread

PRACTICALLY all Non-Skid Tires that make serious claims to non-skid efficiency cost you 10% to 30% more than Plain Tread Tires of same brand and material.

Goodrich Safety Tread Tires cost you only 5% more than our plain tread tires.

Here's how and Why!

o o o

FORTY-FIVE years of Rubber *working* (in what is now the World's *largest* Rubber Factory) has taught us a few Kinks and Short-cuts that are not common to the Trade.

One of these now comes to the help of your Pocket-book.

Through the simple process of Thinking Hard (and being Candid with ourselves) we have found a Short-Cut to make the *best* Safety Tread ever put on a Tire cost us only about 5% more than it costs us to make the Plain-Tread of similar quality.

By testing out these Goodrich Safety-Tread Tires on a large number of Taxi-cabs (where they could be competitively observed and carefully checked up at the end of each day's use) and by comparing their *actual performance* with that of our own, and other Plain-Treads, of much higher price, we have had this fact forced upon us—

Viz:

—That there is SURPRISINGLY *more Mileage*, in Goodrich *Safety Tread* Tires, than in our own, or any *other*, make of *Plain*-Tread Tires.

So MUCH more *Mileage*, for only 5% more *Cost* looked so *good* to us that we decided to give Car Owners the benefit.

Here's what we now offer *you!*

The *best* Non-Skid Safety Tread ever put on the market, and it costs you only 5% more than our best plain tread tire.

Note the following table of comparative prices on non-skid tires. Columns headed "A," "B," "C" and "D" represent four highly-advertised tires:

Size	Goodrich Safety Tread	OTHER MAKES			
		"A"	"B"	"C"	"D"
30x3	$ 9.45	$10.55	$10.95	$16.35	$18.10
30x3½	12.20	13.35	14.20	21.70	23.60
32x3½	14.00	15.40	16.30	22.85	25.30
34x4	20.35	22.30	23.80	31.15	33.55
36x4½	28.70	32.15	33.60	41.85	41.40
37x5	33.90	39.80	41.80	49.85	52.05

Questions and Answers

THE EDITOR AND STAFF

Diabrotica

Am sending specimen of bugs which are destroying many garden plants, especially beans, squash, cucumbers, etc. What is the insect and what is the best bethod of handling?—Subscriber, Tulare.

This greenish yellow bug with the 12 black spots is the common diabrotica, one of our most perplexing garden pests. One member of this family is commonly known as the cucumber beetle, while one 12 spotted specimen, common over the East, is diabrotica duodecimpunctata. The specimen sent by our subscriber, the most common on the Pacific Coast, is diabrotica soror. There are others, but they need not be introduced to our readers for this one gives sufficient opportunity for activity. Where it infests fruit trees it can be destroyed by the use of Paris green or other arsenate sprays though care should be exercised in its use on trees which are ripening fruit. The arsenical poisons, however, prove injurious to members of the cucumber and squash family so the most effective method of protecting a few plants in the garden would be to cover with frames covered with cheesecloth or similar material. Ashes sprinkled with kerosene or distillate and scattered over the ground around the vines are a most excellent repellent.

Lemon Prices

How much do the prices of lemons today depend upon tariff and the present administration, and how much of it is manipulation? How much of it is due to general hard up condition of people who can't or don't buy lemons? I am inclined to believe the distributors are taking advantage of the tariff, for in at least four towns that I know of in the Middle West lemons are selling at the prices they did, 30 cents, 40 cents and even 60 cents a dozen, when we got better prices here.—Warren Roberts, San Diego.

If we should draw upon our wisdom and tell just exactly the effect of the tariff or free trade upon the market we expect a number of our subscribers would rise and say, "Tain't so!" but we may possibly be permitted to remark that there are many things besides tariff which affect prices. The principal influencing factor is that of supply and demand. Perhaps the next most important is the weather. Sizzling hot weather causes consumption of lemons, and it has been noted when the weather has been hot enough over the East and the supply short enough the importers have not been so insistent on the sick in hospitals and poor families having lemons at a low price as they have during the discussion of the tariff question, for at such times they have boosted prices until lemons have sold in New York as high as $10 and $12, and this when the tariff was not far from one dollar per box and at times of free trade at even higher prices. Some of these exceedingly high prices have prevailed since lemons have been practically on the free list. At the present time there are hundreds of thousands of boxes of lemons afloat coming to the American market. The weather is extremely wet and cold over the East, consequently the immense supply and the demand practically nil result in the worst condition our lemon markets have ever experienced. Presumably the low tariff has induced many of these lemons to come, therefore our assumption would be that at the present moment the low tariff has induced larger shipments and lower prices to the producer of American lemons. As a rule the consumer pays very nearly the same price year in and year out, regardless of tariff or even the supply. This the retailer excuses on the ground that when he sells lemons he is selling his services, especially delivery which costs the same the year around.

Chinese and African Geese

Will you kindly advise in your paper the difference between African and Chinese geese in California. Kindly describe both.—Subscriber, Merced.

The Perfected Poultry of America says:

"African Geese—The English class the Chinese and African as being nearly of the same variety." The African goose is of a larger size and has a body more than double the size of the average Chinese. One distinguishing feature between the African and Chinese is that the African is short and heavy in neck, short bill, heavy in head, and carries considerable dewlap, while the Chinese have long, slim necks, small head, and no dewlap. The Chinese with us is the bantam goose, while the African is large in size and highly considered as the best to use for crossing with other varieties, preferably with the Canadian goose. This cross produces what is known as the mongrel goose, which is considered best of all for market purposes in the New England states. The African and Brown Chinese geese are much the same in color. The African goose is of a grayish shade of color, striped with darker shading. The bill and knob are black; shanks and toes dark orange. The neck, which is dark gray in color, has a darker stripe running down the center of the back of the neck.

"Chinese Geese—There are two varieties of these, the brown and the pure white. As stated above, these are the bantam geese, which should be bred small in size and not be encouraged in overweight. The peculiarities of these geese are the long, slim neck, the close, compact body, well-placed legs, and their active motion."

Olives Not Bearing

What is the matter with five-year-old olive trees which blossom profusely but set no fruit? I pruned the trees thoroughly in January. Am not informed whether they have borne in previous years.—Subscriber, Holtville.

It is impossible from the information given to say what is the cause of the olives setting no fruit. A hot wind or a cold rain at blossoming time is sufficient to cause the loss of an entire crop, or lack of pollenization will greatly reduce it. Heavy irrigation with exceptionally cold weather at blossoming time is also a severe test of the ability of the tree to hold its fruit. It would be necessary to make an investigation of previous conditons affecting the trees before a definite answer could be given.

Fungus and Peach Bloom

"We have peach trees about four years old. All the leaves have fallen off, also the fruit. On opening several of the peaches we find that they are wormy. What is the cause and remedy for this trouble?"—Subscriber.

The diseased condition of peach trees this season is quite prevalent and is no doubt due to the very wet spring which with the warm weather created favorable conditions for the growth of fungus. From indications there are all kinds of fungus possible this spring. Some growers say shot hole is even on their walnuts. The wet weather came just at the time spraying should have been done to be the most effective. In most orchards the ground was too wet to get on even

for days after the rain ceased. The peach worm is controlled by spraying just before the blossom opens, and this was impossible in many orchards, hence it is surprising that more peach worms have not shown up. If all the trees are thoroughly sprayed this fall and again next spring before the buds open no doubt these troubles will decrease to small degree.—J. W. M.

Ducks in Tules

I have a tule pond of one acre in my pasture where water stands from May to January. The water is good for stock to drink as it rises and falls with the water level of the community. I am informed that ducks will not live long on such pond on account of the tules in the water. Is this information correct?—Subscriber, Parlier.

We do not believe there would be any injury in allowing ducks to feed in this pond. However there have been seasons when wild ducks have died in large numbers without any definite explanation as to the cause. It is possible this may be the explanation. We will be glad to hear from subscribers as to experience with ducks in tule sections.

Feeding Summer Prunings

I am feeding summer prunings from Malaga vines to pigs and shoats. Have they any value and to what other common food could they be compared in feeding value?—Subscriber, Parlier.

We do not question that these prunings make excellent succulent feed for your stock and can see no possibility of harm from feeding them, but as to an analysis showing their value we are not aware that any has ever been made. We would consider their value similar to that of sorghum or other soiling crops.

Cost of Cans

Some weeks ago the Cultivator gave a fund of information regarding canning and referred to the cost of cans as being from $18 to $20 per thousand. A subscriber at Live Oak has written in that last year the best special price he could get was $27.50 in thousand lots or $25 in carlots, and that f. o. b. San Francisco. He wishes information as to the correctness of the figures which were given by Mr. Cruess in the original article. The inquiry was forwarded to Mr. Cruess but as he was out of the city he was unable to reply until the present. He answers as follows:

"The cost of cans given in the article recently published in the Cultivator applies to the sanitary can only. This is the can universally used in large canning factories. The price given is for the number 2½ size of can, the one most commonly used for fruits and tomatoes. The studhole or solder top can is more expensive than the sanitary can because of the smaller number used and because of the greater difficulty in manufacture. Cans of this kind come to about $26.50 per 1000 as compared with $18.00 to $21.00 per 1000 for the sanitary can of corresponding size."

Browning of Avocado Leaves

A subscriber writes asking as to browning of avocado leaves and dropping from the tree. This was referred to Prof. Fawcett and he writes that he was unable to discover any fungus. At the same time we submitted specimens to Mr. F. O. Popenoe of Altadena, and he answers:

"The browning of the avocado leaves is a trouble that I believe no one has exactly determined the cause of, beyond that it is from root disturbance. It is observed when the tree has been watered too heavily for some time, perhaps also where the tree has been overfertilized. If the drainage is not good and watering has been too copious the edges of the leaves turn, then the entire leaf blackens and drops off. The new leaves then come out and if the adverse conditions are not too severe no further difficulty is experienced. It is a rather common trouble but one that rarely causes a tree to die, and so is not considered serious."

Manners have an enormous commercial value in life. No one can have lived as long as I have without noticing the weight and value of manners in the ordinary transaction of life, in public life, and having seen men by appearance and manners get such a start of very much abler fellows that they have been able by appearance and manners to keep their place much higher in public life than their own abilities or service would entitle them to.—Lord Rosebery.

RECEIVER'S PUBLIC SALE

Of

Nursery Stock to be Held at Claremont, Cal.

Wednesday, July 7th, 1915

Peaches, Pears, Apples, Olives, Citrus and a large variety of Deciduous Fruit Trees, Ornamental Plants, Shrubs and Trees, Roses, etc.—To be sold to highest bidder, at office of Claremont Nurseries, Twelfth Street and Indian Hill Blvd., City of Claremont, Los Angeles County, California.

All stock is divided in blocks and will be sold as it stands.

Particulars regarding parcels, contents of each parcel and any other information regarding the sale will be furnished upon application to the Receiver.

Possession is acquired on day of sale, and growing stock may remain in the field until the next digging season, by making arrangements with the present owners of land. Labor can be arranged for, by contracting with responsible parties, now in the employ of the Receiver.

Sale continued to following day if necessary.

TERMS:—1-3 of purchase price at time of Sale, Balance in Ten Days.

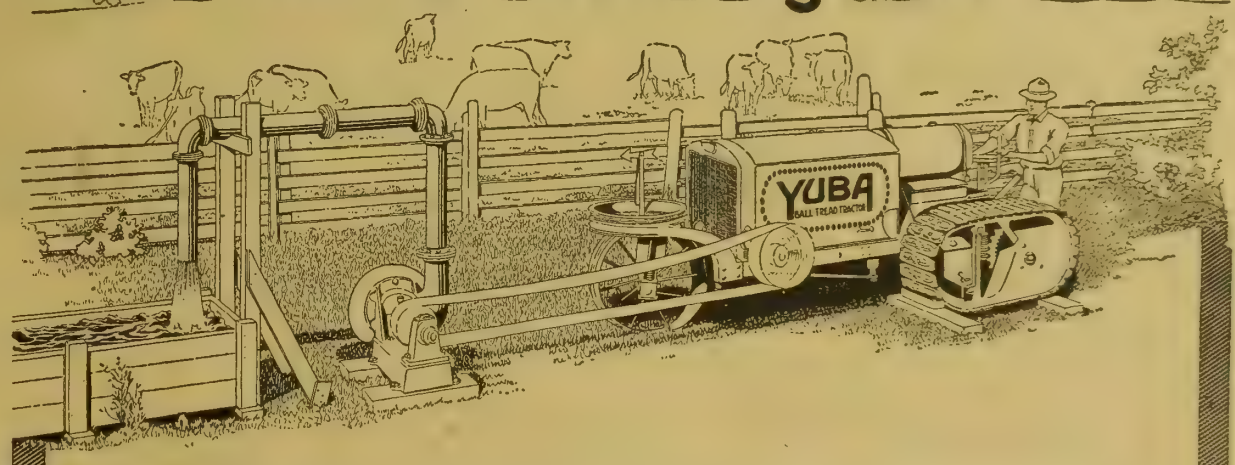
ARNOTT & CO. 112 So. Los Angeles St. Los Angeles

when there's nothing else to do



The Yuba Ball Tread Tractor is designed and built for use on some type of work every day in the year.

Directly in rear of the radiator is a cross-shaft connected to the motor by beveled gears running in oil. The starting crank is on one end of this shaft; on the other end is a stationary pulley. This shaft is not an after-thought, nor is it ornamental. Every Yuba Ball Tread Tractor has one and when the operator needs it, he uses it.

THE YUBA BALL TREAD TRACTOR

The stationary pulley is supplied with every machine. When so desired, a clutch pulley is furnished as an extra. When there is nothing else to do, The Yuba Ball Tread Tractor will pump water, generate electricity, mix concrete, saw wood, cut feed or furnish power to a stationary thresher.

There is a booklet describing it.

The Lawn and Flower Garden

BREEDING NEW PLANTS

Written for the California Cultivator
By Ernest Braunton

NEARLY all the good novelties the world has received in plant life have been the work of amateurs. A very small per cent have been the work of professional plant breeders. There are no secrets in this or any other phase of horticulture; all is an open book. I can show anyone in a few minutes how to hybridize and propagate new flowers from seeds.

Everyone engaged in business has a few secrets, matters peculiar to his own methods of attaining results, that he calls business secrets. The plant breeder has no more; they differ but in kind. I have found out certain specific things necessary to best results in getting new sorts of gladioli but I do not keep them secret. Many of them would be useless to any other plant breeder for none work with quite the same material. But an amateur has more time than a professional and so if a dozen amateurs each have a hobby, one of roses, another of carnations, others of dahlias, iris, gladioli, etc., each one crossing every season, the aggregate results will surpass those of any single professional if the work is persistently and intelligently carried forward. As a means of pecuniary profit it is a very poor business, but as a hobby it more closely holds the interest of the worker than any other could possibly do.

If you wish to try hybridizing or crossing of plants the process is easy to understand. First, remove the stamens. In many flowers this should be done before the flowers open. In gladiolus it should be done after the flower is open, and in this flower they are three in number, balanced on the tips of three thread-like stems. Second, put a bag of paper or cheese-cloth over the flower that insects or humming birds will not do the work for you. In gladiolus the second morning after the flower opens the three-pronged stigma will be receptive. Take a stamen from the other flower with which you wish to cross; with a toothpick scoop out a little pollen from the slit in one of the long pollen sacs, which in each gladiolus stamen are two in number. Daub some of this pollen on the prongs of the stigma, cover with the sack for a few days, and seeds will soon set. Better use named varieties, mark on a label on the plant what you have done, thus: America x Klodyke and record the same in a book so if labels be lost the record remains. The remainder is easy—sow seeds in early spring and nature will do the rest.

"The wisest man still looks about
For things to learn day after day,
And daily finds some new things out
Or puts some old belief away."

Burr Clover a Bluffer

Burr clover is, in some places, a very useful plant. In lawns it is a pernicious and persistent weed and one would think it was most tenacious of life. But look for it in a wild state and you will find that as a rule all died a month or more ago. Like the "filaree" it makes a "big bluff" for a few months; threatens to overwhelm all else, but when the rains stop it quickly ripens its seeds and dies quite suddenly. So marked is this change that often but a week is needed to turn a field from living green to a seared, lifeless brown.

Ornamental Fruit Trees

In rural gardens, and others for that matter, why should not ornamental trees and shrubs be used that have as well a recognized economic value for the crops? Orange, lemon, avocado, loquat, sapote, custard-apple, guavas, carissas, and the like, all these are evergreens and compare most favorably with the purely ornamentive trees and shrubs found in local markets. Are they less beautiful by reason of bearing an edible crop? Certainly not. Then, when you have planted in the yard what trees and shrubs you most admire, let the remainder be of things good to eat as well as good to look upon. Do we not doubly prize the social favorite who can bake a fine cake or pie or loaf of bread? Let us assume a similar attitude toward the fruitful ornamental.

PLANET JR. SINGLE WHEEL HOE IN THE FAMILY GARDEN

Protect the Toad

My gladioli are much troubled at present by the striped beetle which so much infests melon, cucumber, and other members of the cucurbit family. I have always been a strong friend and defender of the common toad as it is the best vermin destroyer I know. But a few evenings ago, just at eventide, I saw one dart out his tongue and catch one of these pesky beetles. Wherefore I am once more on the hunt for toads, either lost, strayed or stolen.

DEEP CULTIVATION POSSIBLE WITH WHEEL HOE.

THE BARRIER

First Tramp—You won't get nothing decent there; them people is vegetarians.

Second Tramp—Is that right?

First Tramp—Yes, and they've got a dog wot ain't.—Philadelphia Inquirer.

IRRIGATION APPLIANCES

The 20th Century Method of Irrigation

As superior to old methods as the modern auto is to the ox cart.

Saves Water, Land and Labor.

Don't experiment—the best is the cheapest in the long run.

Illustrated Catalog and full particulars on request.

Kellar-Thomason Company
"Originators of the Valve System of Irrigating"
1226 E. 28 St., Los Angeles

Ideal Gopher Trap

Only Trap guaranteed to catch large or small gopher. Being round with thin edges gopher walks into trap before detecting anything in runway. Positive grip, jaws always hold. 100% efficient—catches gopher every time. Easiest to set. Far safer and surer than poisons or gas. Farmers say it's worth dozen other makes. Price 50c. If your dealer can't supply you, will be sent postpaid on receipt of 60c; two traps for $1.10; six for $3.00. Money back if not satisfied.

E. J. CHUBBUCK CO., Dept. A,
731 Market St., San Francisco, Cal.

Pumps For Every Purpose

For deep wells, shallow wells; double-acting, single-acting; power outfits, etc. 300 styles and sizes—$3 to $300. Backed by 65 years' experience. Expert advice free. Ask your dealer to show you.

GOULDS RELIABLE PUMPS

Tested and guaranteed. Send today for our new book, "Water Supply for the Country Home."

FOR FIGHTING FIRE USE
GARSTANG GRASS BURNER

For the city lot owner, or rancher. Designed solely for fighting dangerous and useless brush and weeds. Clears off city lots or vacant acreage. Kills the seed of weeds and rank vegetation at the right season. Safe, inexpensive and an efficient safeguard against accidental fires. Burns oil, distillate or gasoline. Prices on application.

Richard Garstang, Patentee, 224 W 30 St., Los Angeles

When writing advertisers, mention the Cultivator.

CULTURE OF TOMATOES

(Continued from Page 699)

before harvesting. Tomatoes to be used for local canneries are usually not picked until they are ripe. On account of the structure of this vegetable it is absolutely essential that they be handled in a very careful manner for they are very easy to bruise and every bruise means a rot in a few days. Tomatoes which are grown for the canneries are placed in boxes holding from 35 to 50 pounds, hauled directly to the car and shipped to the cannery. When harvested for the local fresh markets the crop is usually placed in lug boxes or crates and hauled directly to the market. Tomatoes for long distance shipments should be handled extremely carefully and are generally placed in lug boxes, hauled to the packing house in wagons which have springs on them or in which a layer of straw has been laid to prevent unnecessary jarring. At the packing house these are repacked into crates, wrapping each tomato in tissue paper and being careful that the crates are packed tightly and only those of good quality shipped. Those which are unfit for long distance shipments are generally sold to local canneries.

Varieties

Of the large number of varieties of tomatoes there are comparatively few which are grown in this state. The most popular and best variety for canning and for the market is the Stone. This is a large, well-shaped, highly colored tomato and is the general favorite on the market. It is however a little slow in maturing and should not be used for early spring crops. The Trophy is grown principally throughout the San Francisco Bay region for canning purposes. The vine is a vigorous grower and heavy bearer but the fruit is too rough for marketing and not as good a keeper as the Stone. The Sparks Earliana variety is commonly used for the early spring crop. This is a small tomato, not a specially good keeper though it is strongly recommended for the purpose for which it is grown. The Early Los Angeles variety is one which is becoming quite popular and it matures quickly and should prove adapted to the grower for the early spring crop.

Damping Off

This is commonly found when raising tomatoes in the early spring. It appears only in the seed beds where it kills the plants rather promiscuously throughout the beds. It is caused by several different fungi which gain entrance to the stem and root near the surface of the soil and kill the plants in a very short time. The control is more preventive than curative, for after a bed has once become infected it is very hard to stop the ravages. The grower should raise his plants in such a manner that they will have plenty of ventilation, avoid overcrowding and irrigate when possible only in the mornings of pleasant days so that the surface of the soil and tops of the plants will dry off before night. Spray the bed with Bordeaux Mixture using: Blue stone five pounds, lime four pounds, water 50 gallons.

Failure to Set Fruit

It is very commonly found that while the vines set a heavy crop of blossoms many of them fall at the time the tomatoes should be forming. This is brought about chiefly by the climatic conditions, such as rain, cold, heavy fog, extremely dry hot weather or in fact any weather conditions which will prevent the proper scattering of the pollen and proper fertilization of the blossoms. Irrigation at the time the blooms are setting and overrichness of the soil in nitrogen are often responsible for this condition. For the control the growers should find out if possible which of the foregoing conditions is responsible for the failure of the fruit to set and remedy it as best he can.

Late or Winter Blight

When growing tomatoes during the rainy season the grower frequently loses an entire crop from this disease which attacks the leaves, stems and fruit, causing the appearance of black spots or lesions. This is controlled by spraying with Bordeaux mixture, using: Blue stone five pounds, lime six pounds, water 50 gallons. This should be applied immediately after the first appearance of the disease, for when it has become established it is impossible to check it.

Blossom End Rot

This disease is very commonly found in California and is characterized at the blossom end by watery areas which are usually circular and which later turn black, causing the decay of the tomato, making it unfit for food. This has been found chiefly where the field has been allowed to become too dry between irrigations or when the plants have received an inadequate amount of water throughout their growth.

For the control of this disease the grower should so time his irrigations that the plants do not suffer for water, and if irrigation is not practiced, cultivation should be given often enough to preserve a good mulch and retain as much of the soil moisture as possible.

Root Knot

Occasionally in fields in which the soil is of a sandy nature the roots of the tomatoes are found to be completely rotted off. This is usually caused by a very small worm known as the nematode. Where this is found in the fields a rotation of crops should be practiced.

Summer Blight, Wilt or Western Yellow

This disease is very severe in many tomato fields in California especially where the soil is of a sandy nature and the crop is growing during the summer months. This has probably caused more loss to growers than any other tomato disease. It is characterized by the dead plants scattered promiscuously throughout the field, and gradually all the plants may become infected until the field is worthless. Occasionally the infection is limited to a small number of plants.

Description of an Infected Plant

After a plant first becomes infected growth stops and the color becomes unhealthy, resembling a plant which is getting an insufficient amount of nourishment. Upon close examination it will be found that the veins of the leaves have become a purple color which is especially noticeable on the under side. All the leaves show the disease at approximately the same time. The central cylinder often dries up leaving a hollow core, and if the top of the plant be cut off at the ground it will bleed very little, showing a scarcity of sap. After a plant has been killed by this disease the main branches remain in their normal position but the leaves and ends of the stems and laterals finally droop and dry up. No unnatural spots on the leaves, stems or fruit have been seen in connection with this disease.

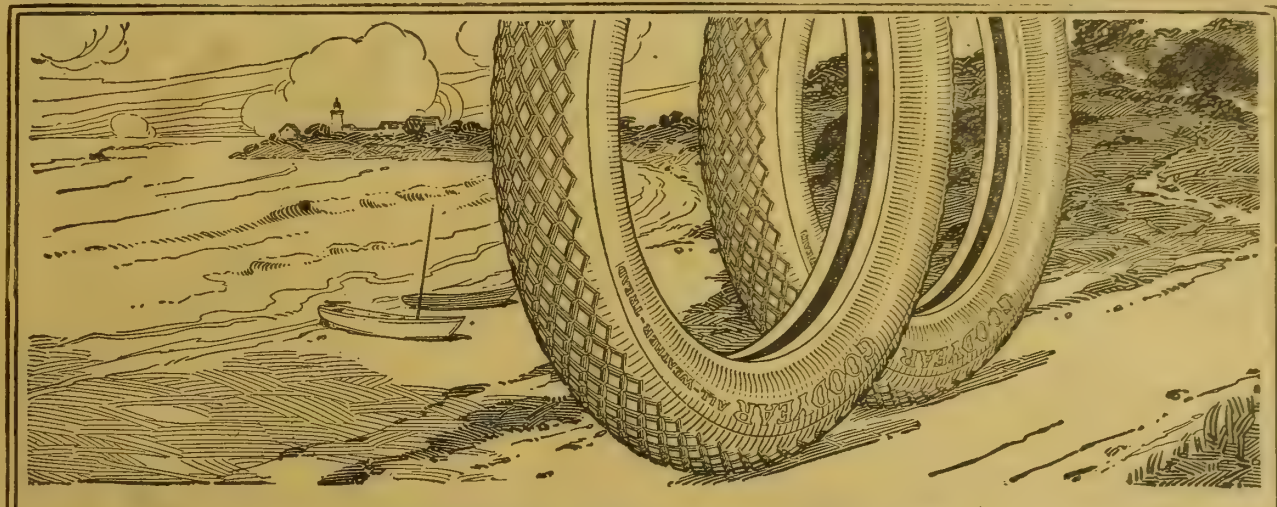
There has never been any satisfactory method of control found for this disease, but following will be found some of the observations which have been noted:

The amount of wilt is not influenced by rotation of crops, character, preparation of the soil or care of the plants in the seed bed and in the field.

There is apparently no difference in the amount of resistance in the various varieties.

There is a close relation between the appearance of this disease and the season of planting. Plants set in the field during the early spring are much more liable to become infected than those planted after the middle of June. The date of the appearance of the wilt is dependent to a large extent upon temperature; it appearing generally soon after the first hot weather of the spring.

Soil which is producing tomatoes for the first time is liable to contain as much disease as that which has been growing this crop for a long number of consecutive years.



Goodyear Passes Goodyear

$500,000 Better

Yet Users Pay $5,000,000 Less

Note these amazing facts:

Goodyear tires, as built this year, will cost us $500,000 more than if built like 1914 Goodyears.

That's because of improvements.

Yet this year's output will cost our users some five million dollars less than if sold at 1914 prices.

That's because of a big price reduction, made February 1st. It was our third in two years, totaling 45 per cent.

Why Better Tires?

You ask why we add that half-million dollars in face of such reductions.

We have always added every betterment our experts could discover. And we spend on research $100,000 yearly just to seek improvements out.

Goodyears may pass Goodyears, but we make sure that no rival ever can.

What Extras Cost

Goodyear Fortified Tires embody many extras. Five of them are features found in no other tire that's built. Others are found in but few.

Based on current output, those extras this year will cost us $1,635,000.

That is, if we omitted our exclusive features, which all others do omit—

And other protections which most makers omit—

We could probably add to our profits this year more than 1½ million dollars.

But What of You?

But Goodyear users would pay. Those extras save our users many times the cost to us.

In those extras lies the reason why Goodyear outsells any other tire. And in that mammoth output lies the reason for the value that we give.

Think of these things when other tires are offered. Each Goodyear extra means a saving to you. Any dealer, if you ask him, can supply you Goodyear tires. (2413)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SUMMER SESSION

The University of California announces that there will be probably at least 4500 students in its summer courses which begin at the university at Berkeley this week. This number is much greater than have enrolled in any previous summer's work and, more than that, the 4500 students will be learning greater efficiency during the next few weeks.

INDEX

There is one pecularity about the present volume of the California Cultivator; it has only 25 numbers. Volume 33 was also an exception because of its 27 numbers, and the other volume of 1915 which ends with Thursday, December 30, will also have 27 issues. It will be many years before this will occur again. At first glance the index may not look particularly interesting, but we are sure that the subscriber who has saved his file for the last six months will find those ten columns of index of as much value as any book in his library.

We call attention to the binder which the business office of the Cultivator will send to any subscriber for $1.15 to any point in California. This binder has capacity for two full volumes, or for the entire year. We fear that subscribers often fail to preserve their copies and thus lose the vast fund of information which is given in our columns. Note under "Contributors" in the index the number of representative Californians who have contributed to our columns during the past six months. If you have not preserved the file in the past begin with the issue of July 1 in Volume 45, which will have more of value than has Volume 44—a statement which we will probably again make in the last issue in December as to the coming volume, for the farm paper which is not growing better every issue is not serving the needs of California agriculturists.

STANDARDIZATION

Our state law will now compel all of us to be good as to quality of fruit which is to be sent out. This law is not needed to compel three-fourths of California fruit shippers to do what they are already doing, but there is a disposition on the part of a few shippers to trade on the good name of California and secure fair prices for an inferior article or possibly for a fairly good article improperly packed.

The engraving on our cover page is an illustration of ranch packing which is intended to improve the good reputation which California already has in all the fruit markets of the world. Those cherries were packed by Mr. Millard Sharpe whose cherry orchard in the Vaca Valley is growing magnificent cherries. Mr. Sharpe's orchard is not extensive, but he is the kind of person to make up in quality of fruit and pack the lack in quantity. It costs more to pack fruit as is should be packed. It is possible that the first year it brings but little more than the indifferently packed, but where one is in business for life or for a period of years the money will be returned with good interest.

COMMUNITY COOPERATION

The community which does not do team work or hold together, or in other words, whose people do not cooperate in advancing its interests, is an undesirable place in which to live. In the first place there is the direct loss of advantages which may only be secured by intelligent cooperation, and more, it is reasonably sure to be a community of people of not the highest grade of intelligence, for it takes an intelligent people to cooperate. Every section needs better schools, better churches, better roads and sidewalks, better stores, more social facilities, even more of modern luxuries and advantages. It is born in all the human race to be ever demanding more and better, and until the people of each community can rise to the point where they will unite with neighbors, they will be lacking, in some degree at least, in these most desirable things which elevate and consequently make more prosperous all of the people. If good roads, imposing churches and the finest school buildings in the world stand for anything, surely California is well in the advance in cooperative effort.

But few Californians are like the Irishman who preferred nine children to nine million dollars for the reason that if he had the nine children he would be satisfied while if he had the nine millions he would everlastingly want more. Californians want more children and more opportunities for them and in addition propose to get the millions of wealth which will secure those opportunities.

Calling attention to claimed undesirable features in an adjoining or other community never added one factor to any one's welfare. The shouting of "Boost" sounds good, but like the Fourth of July boy's firecracker its force is soon expended. "Community cooperation" has a less explosive sound but its accomplishment goes far in the bettering of our already good schools, stores, facilities and beautiful roadways.

"Cooperate" is a good slogan. Use it in your community.

ADVERTISE OUR PRODUCTS

It has been said of a successful merchant that if he were in a land of savages and should receive a shipload of button hooks his business capacity would create a demand for those millions of button hooks and they would be disposed of at a profit.

There are hundreds of great merchants in this land of advertising who are equally resourceful. We prove this every year by eating thousands of tons of breakfast or other foods at prices sometimes hundreds of percent above other foods equally as nourishing, all because a successful advertising campaign has convinced us that a dependable trademarked sanitary package is desirable enough to justify the higher cost, and we continue to buy.

While we have all recognized that this is true of a manufactured article we have been slow to apply the same principle to our fruits or farm products. However so far as it has been done "California is ahead" again. Our peaches, prunes and persimmons; our cherries, cantaloupes and even celery; our olives, onions and oranges have all felt called upon to advertise themselves.

The orange and the lemon are the most ambitious and have made good as none other in a general and continued advertising campaign. We say continued though during one year—that of the "freeze"—the appropriation was recalled and the work not taken up till the next year.

The burden for this campaign has fallen almost entirely upon the one great cooperative organization, the California Fruit Growers' Exchange. During the past year this organization of growers has spent $275,000 in advertising California oranges and lemons. While the burden has fallen only on the members of this organization the benefits have accrued, to a degree at least, to all. To be sure it was intended to make known the fact that "Sunkist" brand on a box insures quality. But all oranges, both California's and Florida's, have been more generally eaten because of this campaign.

But Sunkist has become a household word. It will become even more familiar for a better managed campaign will be conducted next year than ever before. During last week and the present one a school of Sunkist advertising has been conducted at the office of the general exchange in Los Angeles. At this school or conference there were present President F. Q. Story, General Manager G. Harold Powell. Assistant General Manager E. G. Dezell, Orange Sales Agent D. C. King, Lemon Sales Agent T. H. Powell, Manager F. B. Hutchens of the Fruit Growers' Supply, all of the home office.

From the East came R. J. Grassley, advertising manager of the Exchange; D. W. Francisco, assistant to the general manager of the Chicago office; W. T. Kester, vice-president and general manager of Lord & Thomas; R. T. Crane, writer of ad copy for Lord & Thomas, and Everitt Sisson of the Curtis Publishing Company.

In conference every angle of advertising in newspapers, magazines, car and other banners, window cards, premiums and every other conceivable form was discussed. It will take a year, perhaps years, to learn the full value of this conference. We believe it will be great to the orange grower and to California.

Meantime it is costing the grower less than two cents per box of fruit and adding to the return to him, and far more is increasing consumption, so that hundreds of cars now going Eastward are saved from going to the "wash."

Agricultural Notes

The College of Hawaii has added a four-year course in sugar technology.

The United States forest service is undertaking the reforestation of lands on light house reservations.

When last heard from the jitney had reached Honolulu. Now we hear that it is in the Philippines and Manilla is soon to have a jitney service.

The Florida Citrus Exchange has decided to close its fiscal year on September 15 instead of July 31 as previously. The year of the California Fruit Growers' Exchange closes on October 31.

As a result of the European war the approximate gross earnings of state and guaranteed railways in India for the year ended March 31, 1915, were $10,000,000 less than in the preceding fiscal twelvemonth.

Three ships from South Africa arrived at the port of Boston on May 27 and June 1, carrying wool. These are the first direct shipments of that commodity received at Boston from South Africa for many years. Previous to the arrival of these ships, wool from South Africa reached Boston via England.

The potash famine is turning many eyes toward the Pacific kelp beds where some work is now being done in converting this kelp into fertilizer. Since February 1 but one cargo of German potash has been received in an American port. Potash salts which sold a year ago at $38 per ton are now quoted at $160 to $175.

The relative humidity in the middle of the day will hereafter be included in the weather reports furnished daily by the weather bureau to the newspapers. Observations at present are taken at 8 a. m. and 8 p. m. An observation of the relative humidity at 2 p. m. will indicate much more accurately actual working conditions.

The New Zealand government has expended $7,738,709 in the purchase of frozen meat for the home government since it took over the control of the meat export on March 3, 1915, and there is much still to follow. The price paid is very satisfactory, and the only thing delaying shipments is a lack of refrigerator space in England.

So great is the demand for marmalade in England that Spanish shippers are still sending bitter oranges, to be disposed of on the English market It is abnormally late for the fruit, and the oranges are not good either in quality or condition, but the market price stands at $3.16 to $3.41 a half chest, which contains about 80 pounds of sound fruit.

Grapefruit growers of the Isle of Pines, south of Cuba, expect to profit by Florida's proposed marketing law which prohibits shipment of grapefruit from that state before November 10. The island growers say this will give them 60 days market without competition as their fruit ripens earlier in the warmer climate. Many Florida growers also see the same point and are objecting strenuously.

The completion of the steel bridge across the Colorado River at Yuma forges a link in what is known as the southern national highway, which runs from El Paso, Texas, through New Mexico and Arizona to Globe, then to the Roosevelt dam in the Salt River Valley to Phoenix, thence to Yuma. The steel bridge at Yuma was built by funds contributed by the United States, the state of Arizona, the people of Southern California, and the city of Yuma.

Agricultural News Notes of the Pacific Coast

Northern California

The Gravenstein apple show is to be held August 14-22.

The Orland farm center of Glenn County held a big picnic on the 29th of May.

The Humboldt County Dairymen's Association will hold a picnic at Loleta July 31.

The Browns Valley farm center of Napa County meets on the first Wednesday of each month.

The farmers' club of Codora, Glenn County, is to have an all-day picnic on July 4 at Packer Grove.

The forest supervisor at Placerville, Eldorado County, is distributing free vaccine to prevent outbreaks of blackleg.

Several hundred acres are being planted to blackeyes and teparies in the section about Fairoaks, Sacramento County.

The Yolo County Cow Testing Association has discontinued operations. Not enough cows were signed up to justify further work.

The state civil service commission of California announces that examinations have been scheduled for July 3 for vegetable gardener.

The Napa County farm bureau is conducting a squirrel extermination campaign and is selling poisoned barley to its members at cost price.

The right of way of the Oakland, Eastern and Antioch Electric Railroad is to be put into a vegetable garden. The garden will be 85 miles long and 100 feet wide. The land will be leased to growers.

Central California

The grain harvest is on in Merced.

The Tulare cannery is working on apricots.

Ten thousand acres of grain were destroyed by fire in the Huron district.

Some shipments of Valencias are being made from Terra Bella, Tulare County, groves.

President Wiley M. Giffen of the California Associated Raisin Company is on a business trip to Eastern cities.

The supervisors of Stanislaus County have appropriated $2000 to pay expenses of the farm adviser for one year.

The Tulare Cooperative Poultry Association reports its total business during the month of May amounted to $5,250.

It is reported that the Santa Fe Railway will soon put on an iced car from Fresno to Los Angeles to handle packages of green fruits.

The Lindsay Citrus Exchange at a recent meeting gave unqualified endorsement to the marketing methods of the California Fruit Growers' Exchange.

It is possible that a market expert of the new United States Bureau of Markets will be stationed in Fresno to assist growers in disposing of the peach and tomato crops.

The Associated Raisin Company has announced its schedule of prices which will be effective until August 1. The association has on hand about 30,000 tons of last year's raisins.

Southern California

Cotton growers of Blythe, Riverside County, met Saturday, June 12, to discuss marketing matters.

One pumping plant at Corona, Riverside County, pushes water four miles up a hillside and lifts it over 700 feet.

The Richland Walnut Association of Orange County reports trees overloaded with nuts and considerable damage from walnut aphis.

The Puente Valley shows a large planting of bush lima beans this year. The blackeye, however, shows the largest acreage.

The San Diego County farm bureau has asked that the law protecting rabbits be repealed as they are proving a serious pest on the farms.

San Diego County farmers are much interested in the organization of the Winter Vegetable Union. Agreements are being signed up rapidly.

Supervisors of San Luis Obispo County have agreed to contribute one fire guard for the protection of their section of the Santa Barbara forest reserve during the next two years.

The Claremont Pomological Club held its annual picnic meeting at Ganesha Park, Saturday, June 19. State Horticultural Commissioner Cook was one of the speakers.

Dr. J. Eliot Coit, head of the department of citriculture of the University of California, conducted a lemon growing field meeting in the orchard of L. E. Mills at Santa Paula on June 17.

The Coast

The sixth annual horse show was held at Genesee, Idaho, June 11.

The board of trade of Willcox, Arizona, is working to secure a creamery.

A farmer of Hepner, Oregon, has a record of 97 coyotes killed in a hunting trip of 15 days.

Farmers of the district about Miles City, Montana, have formed an anti-hog cholera association.

According to estimates of bankers of the Inland Empire the 1915 crop of wheat will be 20 per cent over that of 1914.

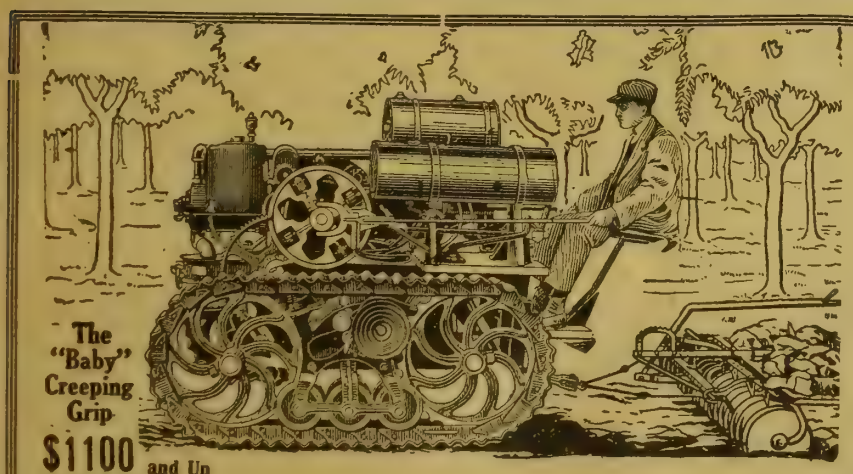
Crabs are reported so plentiful in Winchester Bay, Oregon, that they can be taken up on the oars of a boat two or three at a time.

The farm markets bureau law passed by the last Idaho legislature has been declared unconstitutional by the state attorney general.

The dates of the Stevens County, Washington, Live Stock Association show have been changed from October 26—29 to October 27—30.

Montana farmers are finding a serious pest in the fan weed which is now generally spreading over the central and western part of the state.

J. Meyerhoff, owner of a ranch on Avenue 21 and Grand Canal, Phoenix, Arizona, is preparing to go into the hog business. A feature of his place is the exceptionally sanitary conditions found there, especially the presence of abundant shade and the absence of mud holes.



Cultivate with a
"Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator

"Fills Silos as Fast as Eight Teams Can Haul It To Machine"

This satisfaction of a California dairyman is repeated every season by enthusiastic owners on the Pacific Coast

CLIMAX SILAGE CUTTER

That Famous Inward Shear Saves Power.

The steel knives, finely tempered, and bolted to heavy knife wheel are easily removed for grinding. Their greatest value lies in the fact that they cut from the outer edges toward the center where cutting power is greatest. Other wheel type machines cut the other way.

These Features All Tend to Save Power.

The Inward Shear explained above, the staggered tooth feed rolls make fast feeding possible. Heavy knife wheel, with fans behind each knife, lifts and blows the silage away without clogging. Closed elbow is a great convenience.

It will do maximum amount of work on minimum power.

Write today for FREE catalog and full particulars.

Ask any Climax owner or thresherman about the durability and economy.

58 Dairy Cows and Heifers

At the Dairy Farm of
A. F. SCHEIDECKER

One mile north of BRETONA Station, on the "Old Hiatt Ranch," 16 miles north of Woodland, on the west side.

Having lost all my early hay and having under consideration the renting of my ranch, I will sell without reserve to the highest bidder all my cows and bred heifers as follows:

27 Cows, mostly Durham and Jersey with a few Holstein.

27 Heifers, first and second calf—Durham and Jersey.

These cows and heifers are good milkers and high testers, producing well on pasture and hay. All are in milk or due to freshen soon, and nearly all are bred to my high-grade Registered Holstein Sire.

Four selected heifers, one and one-half years old; 1 registered Holstein bull —"Tula Pieterje Ignaro," grand-son of Ignaro de Kol. A very fine young bull, well taken care of and very gentle. Born November, 1912. One mare. 3 good brood sows, bred.

Lunch served. Terms cash.

Trains arrive at Bretona at 11 a. m. Trains leave Bretona for all points, south, east, and west at 6 p. m.

THE GAS IN SILOS.

PERIODICALLY we read an account of fatalities resulting ing from gas which has accumulated in an ordinary farm silo. These unfortunate acidents vary only in detail. Perhaps a couple of men enter the silo to fork out the day's suply of feed and are subsequently discovered lying on the ensilage where they fell when overcome by gas. Such accidents are the more to be regretted because they might so easily have been averted.

The successful keeping of ensilage hinges upon the process of fermentation, which is simply decomposition in its primary stages. As vegetation ripens the starches in the fruit and stalk change to sugar, which explains the superior taste of ripe fruit over the unripe. When the ensilage is confined in the silo the starches with the natural water change rapidly to sugar which, in turn, ferments very rapidly.

The products of fermenting sugar are alcohol, acid and gas. The gas formed is known as carbon dioxide. sometimes called carbonic acid gas, each molecule of which contains one atom of carbon and two atoms of oxygen. Since this gas is nearly twice as heavy as air it settles in a stratum close to the ensilage. As it increases in volume the layer becomes deeper until it may ultimately reach such a depth that it would envelop the head of a man standing erect. This is usually the case when fatalities result.

Now this carbon dioxide is not a poisonous gas, as is often erroneously supposed, but simply contains no free oxygen which is necessary to support life. It is even present in small quantities in every breath which we exhale, which is one of the chief reasons that we are so careful to sleep in well-ventilated rooms. The victims who succumb to its effects die from suffocation; not from any deleterious effect of the gas on the human organism. Different proportions of carbon and oxygen may form a gas which is virulently poisonous, such as carbon monoxide, or common illuminating gas A molecule of this contains one atom of both carbon and oxygen. But gas of such proportions is not formed in silos,

Carbon dioxide, the silo gas, is practically odorless, and herein lies the danger as its presence is usually unsuspected Since no practicable method of preventing the formation of this gas has yet been formulated, we may accept it is an ever-present factor in silos, and guard against it accordingly. Because of its extreme weight the opening of a vent in the top of a silo, or even a few feet above the top of the ensilage, will not effectually rid the silo of gas and make it safe of entrance unless it is left open for a sufficient length of time to permit the fresh air to circulate thoroughly.

The most modern silo has a door in the side about every foot or so all the way to the ground. This is the ideal arrangement. It permits of the free circulation of fresh air at a level where the gas is sure to be if there is any. Silos with such doors which are entered with any degree of frequency are practically safe. Silos with doors six feet apart should be entered only following some sure test to determine whether or not carbon dioxide is in evidence Pit silos are still more dangerous and should always be tested before they are entered.

The test: Since carbon dioxide is not only non-combustible, but being an inert gas will positively extinguish flame, a sure and simple gas test to apply to any silo is to lower a lighted lantern attached to a cord until it rests on the ensilage If the lantern continues to burn the silo may be entered with perfect safety. If, on the other hand, the flame gives a feeble flicker and dies, carbon dioxide is present in dangerous quantities and the silo should be thoroughly ventilated and again tested before being entered.

Another test, appealing more to scientific men, is to fill a glass test tube with saturated solution of lime water and let it remain for a few moments near the top of the ensilage. Immediately this is withdrawn cover the end of the tube with the thumb and shake the contents violently. If the solution then appears cloudy, and when left standing fine white particles of lime are precipitated to the bottom of the tube, carbon dioxide is present, though not necessarily in dangerous quantities.

To condemn silos because of the possible danger arising from the formation of carbon dioxide would be as short-sighted as to fill up farm wells because careless persons have been drowned in them, The simplest precautions will prevent fatalities in either case, and for real utility a good silo is a close second to an up-to-date water system on the modern farm.—Pacific Homestead.

HOLSTEIN-FRIESIAN ASSOCIATION

The 30th annual meeting of the Holstein-Friesian Association of America was held in Syracuse, New York, June 2, President, D. D. Aitken of Flint, Michigan, presiding. The attendance was the largest ever present at one of these meetings and included about 20 women. All the proceedings were marked by unanimity of thought and action.

The report of the committee on proxies, Edwin K. Munro, Camillus, New York, showed a personal attendance of 443 members with 1719 represented by proxy.

Accessions to the membership to date number 1350, 1208 applications having been made during the fiscal year ending April 30, 1915. The total present membership to date of meeting is, therefore, 7866.

Treasurer Wing R. Smith presented his 18th annual report with great satisfaction, both to himself and to his hearers, on account of the exceptional progress and financial success which it showed in spite of the depressing experiences of the past year. In addition to the figures showing the transactions of his office he gave a few excellent admonitions against the time of reverse fortune which comes sooner or later to all. His report showed cash receipts for the year $346,034.22; disbursements, $176,198.63; cash balance April 30, 1915, $169,835.59, of which $157,530.82 is in the reserve fund.

The report of Secretary F. L. Houghton showed that 135,280 certificates have been issued from his office during the year, a gain of 29,981 over the number issued in 1914. Total cash receipts of his office were $177,392.88, with disbursements of $111,208.98. A total of 1208 new members was admitted during the fiscal year, exceeding by 97 the number admitted in 1914; making the grand total of membership on April 30th last 7724. Notification of the death of 48 members has been received during the year. The secretary concluded with a brief description of the offices of the association, their equipment and the staff of employes.

Superintendent Malcomb H. Gardner reported during the fiscal year, 11,470 cows have been under test, 566 completing yearly records, adding nine names to the list of 1,000 pounds butter cows, now numbering 31. The average of the 10,743 ordinary records was 406.9 pounds milk, 14.474 pounds fat, or 16.89 pounds butter per week. Average per cent fat, 3.56.

ON BEING SATISFIED.

"Say, Moike, which'd you ruther hev—noine millyun dollars or nine children?"

"Begorra," said Mike, scratching his head meditatively, "Oi'd ruther hev the children. If Oi had noine millyun Oi'd want more, but if Oi had noine children Oi'd sure hev enough."

THE CAUSE OF SMALL LITTERS OF PIGS

"Can you tell me why my brood sows only bring between three and six pigs per litter?" Replying to this question Prof. G. W. Barnes, livestock specialist of the University of Arizona agricultural extension service, says:

"If you have studied hog conditions in the United States you will find that about four pigs per litter is the average; and I can point to you men in Arizona who are actually raising for market two and three pigs to the litter, yet the cost of maintenance of the brood sow is practically the same whether she brings two pigs or ten pigs per litter, which means that the farmers are losing a large percentage of profit by keeping such brood sows in their herds.

"There are several reasons why brood sows bring small litters, and I firmly believe that the one which contributes to the trouble more than any other is the practice of breeding sows too young. It is no uncommon thing to find sows weighing less than 100 pounds with pigs. Usually you find them with only two pigs. The young sows which you intend to keep for brood sows should never be bred under nine months of age, and it is much better to wait until they are 12 or 14 months old. Then if they are not fully developed, wait a few months longer. Your brood sow is good for six or eight years, and, if by waiting a few months in the beginning before starting her on her life work, you can increase the size of her litters, you have certainly made good wages for those months. Another thing which contributes to no slight extent to cause small litters is the lack of exercise. A brood sow which does not secure sufficient exercise becomes cross and may eat what pigs she does farrow. Improper care and feeding also come in as contributory causes of small litters. The sow to develop a large, strong litter of pigs must have bone and muscle building foods. Do not be afraid to pasture her on alfalfa and also to feed some barley."

SEX CONTROL NOT DESIRABLE

Nature has many secrets which scientists cannot make her reveal. Almost every conservative live stock breeder has at one time or another experimented in order to discover the secret of sex control. The production of a surplus of males has been the stumbling block for many breeders, and, indeed, the difficulty connected with disposing of males has driven many a timid breeder out of the business. If sex were under control, it is argued, herds would be rapidly increased by the production of females only and such males as could be utilized for breeding purposes, but the secret of this control is just as deeply hidden as in the past and Prof. M. W. Harper, of Cornell University, now calls attention to the fact that sex control is not even desirable.

This specialist points out that equality of numbers of the two sexes is of importance in the improvement of any breed. This is due to the fact that the breeder has a large number of males to select from. This means that the best of them only will be used for breeding purposes, whereas if the number were cut down there would be no such opportunity for emphasizing merit by selection.

Of course, it is not a matter to worry over as yet, because every theory of sex control thus far exploited has utterly fallen down when tested out in actual breeding operations. Many of nature's laws are turned topsy-turvy in order that the needs of men may the better be met, but in this case there may be some advantages, as pointed out by Professor Harper, to have this one secret forever enshrouded in mystery.—Wisconsin Farmer.

RED MOLD OF SILOS

For the last three or four years Missouri farmers who own silos have noticed the growth of a peculiar red mold in the silage. In some years it has appeared only in small quantities, but in others it has appeared at a depth of as much as 15 feet and has infected areas two or three feet square, often adhering to the sides of the silos. Several farmers have written to the college of agriculture of the

"ALPHA JUNIOR"

SPECIAL FEATURES

CYLINDER HEAD AND BASE cast separately; large, well-proportioned hopper, insuring perfect circulation of water full length of cylinder. Copper asbestos packing between head and cylinder.

CYLINDER AND PISTON ground to fit, insuring perfect compression.

IGNITER—Make and break. Standard National Gas Engine Association electrode used, which can be purchased in any hardware store. Igniter fits cylinder on copper asbestos gasket.

GOVERNOR is of two ball type, very accurate and substantial, equipped with speed changing device. The importance of a good substantial, reliable governor on an engine where long hours of pumping or cream separating are required cannot be overestimated.

GASOLINE CARBURETOR OR MIXER is of suction feed type, having a venturia nozzle in accordance with construction used on all Alpha engines, which have become famous for fuel economy and easy starting.

MAGNETO—Sumter built-in, gear-driven magneto. Especially built for the Alpha Junior. We have used Sumter magnetos as standard equipment on all Alpha engines for nearly five years and have never found its equal.

CRANK SHAFT extra heavy drop forged steel ground to size.

CONNECTING ROD—Drop forged steel.

MAIN BEARING—Cut at an angle of forty-five degrees, giving additional strength, lined with the highest grade babbit metal. Perfect alignment. Adjustable to wear.

FLY WHEELS extra large, perfectly balanced, insuring a smooth running engine. It stays where you put it.

Shipping Weight, 300 pounds.

No Batteries. No Coils. Ignition Troubles Eliminated. Built-in, Gear-Driven Magneto as Regular Equipment

Use any injector, but Cutter's best.
The superiority of Cutter products is due to over 15 years of specializing in vaccines and serums only. Insist on Cutter's. If unobtainable, order direct.
THE CUTTER LABORATORY, Berkeley, California.

Glenn County has begun to harvest her grain crop. The yield is unusually heavy.

University of Missouri asking what the cause of this mold is and what to do to stop its ravages.

Experiments conducted in the laboratory of the department of botany show that the growth does not occur without the presence of free oxygen. Its occurrence in the lower depth of silos is probably due to the fact that the silage when packed was not sufficiently tramped.

Another factor which has some influence on the presence of molds in silage is that of moisture. Very often silage is put away too dry. Molds develop in much greater abundance where the silage is only slightly moist. The Chinese people use a red fungus, the mold of which corresponds to the red mold of silage, in manufacturing red rice, a substance used as a food coloring and a beverage. The fact that the Chinese do use the pigment in preparing a beverage tends to show that the fungus is not poisonous. Many Missouri farmers thought that the mold was causing death among stock. The mold has appeared in the silage on the farm used by the college of agriculture, but it is thought that no deaths have occurred among stock because of this growth. The mold has also appeared in other states.

COW TESTING ASSOCIATION TO MEET IN LAKESIDE

The final meeting for the formation of the San Diego County Cooperative Cow Testing Association has been called for 11 o'clock next Saturday morning at Lakeside Hall. The purpose of this meeting will be the adoption of a constitution and by-laws with possibly a few changes in the form suggested by the department of agriculture. A board of directors of seven dairymen will be elected upon whom the responsibility for the business conduct of the association will fall. They will elect a president and secretary from among their number and will proceed to hire a tester and set the machinery to work.

The movement is receiving very satisfactory support in all sections where the matter has been taken up. San Pasqual has signed up 150 cows with another 50 or 75 promised. Ramona has come in with 40 or 50, with more still to come. Lakeside and vicinity signed up 233. Mission Valley dairymen joined to the extent of about 100 cows with more to join who were unable to attend the meeting. Six hundred cows are necessary to bring the cost of testing within the $1.50 per cow per year. One tester can handle more than this, however, and in all probability as the association grows the cost per cow will be lowered.

It will be of interest to all dairymen who have already joined the association and who are interested in joining to be at this meeting in order to acquaint themselves thoroughly with the workings of the association and to see that their district be fairly represented on the board of directors. Remember Saturday morning, June 26, 11. o'clock in Lakeside Hall.—H. A, Weinland, County Agent, United States Department of Agriculture.

Don't Worry About Your Milking.

Make Milking a Pleasure by Using the One Milker That is a Success:

The VICTORY Milking Machine

The Victory is a model of simplicity. No expensive pipe lines or pumps. A machine so simple that a child can operate it. Guaranteed to milk your cows clean, and cannot injure them in any way. The price of a Victory outfit is so low that it will pay for itself in a few months. It is always ready for work and will not go away and forget to come back like your hand milkers. Tell us how many cows you milk and we will tell you what an outfit will cost. We will gladly show you an outfit in operation and you can see for yourself what the Victory will do. Write today.

Sanitary Dairy Supply Company, 246 Central Avenue Los Angeles, Calif.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Mites or Skin Irritation

Every spring my horse begins to rub himself around the neck, head and at the roots of the tail. Sometimes he rubs the mane entirely off. Have washed in zenoleum. This year washed before appearance of the trouble but note its return. A friend claims that it is due to lampas and advises cutting his gums.—Subscriber, San Diego.

It does not seem reasonable that swollen gums (lampas) would cause irritation of the skin. The trouble is probably due to a small mite that burrows deeply and the zenoleum did not reach them all. It might do no harm to examine the gums just back of the upper teeth and if they are very full and attached to the teeth, separate them from the teeth and cut them a little but not very deep. We would also advise getting a thin grade of engine oil and mixing a little zenoleum with it and applying this mixture once or twice a week to the irritated parts, rubbing it in well.

Catarrh

Cow has bad discharge from nostrils but no foul odor. Seems to be all right and has good appetite. The trouble has continued for some months.—Subscriber, Porterville.

Cows are seldom affected with catarrh. It may be from cold, wet weather in winter, from lung worms or from an injury that has caused a growth on the inside. Mix a half pint of turpentine with one quart of raw linseed oil and divide into three doses. Give a dose once in three days. If this does not give relief get gentian, four ounces, nux vomica, two ounces, sulphate of iron, two ounces and chlorate of potash, four ounces. Mix and divide into 20 powders. Give one powder every day.

Sweeny

My mule has bad leg, shoulder badly shrunken. There seems to be a hardening of the muscle. The mule has been sweenied some time. Is there anything I can do to relieve him?—Subscriber, Bloomington.

Sweeny of the large muscle that you indicate must have been caused by an injury. Do not believe that anything can be done for it now.

Barbed Wire Injury

Colt badly cut in barbed wire fence some six weeks ago. The injury is under the fetlock of front leg. Burnt the wound to prevent too free bleeding but the sore continued open with hard swelling around the coronet with opening on the opposite side of the foot from the wound.—Subscriber, Encinitas.

The injury probably reached deeply enough to cause inflammation of the joint and ringbone. Anchylosis of the joint may follow. The nerves may have been cut off also and that would retard the healing and leave the foot numb. Wet the swollen parts once a day with the following liniment:

Mercury bichloride, two drams, alcohol, two ounces and enough turpentine to make one pint. Mix in the order given. It is seldom that an animal recovers completely from severe injuries affecting the joints but in this case the lameness may disappear and the horse be all right for farm work.

A FINANCIAL GENIUS.

"Why are you crying, Willie?"

"I lost a nickel."

"Never mind. Here is another one," said the kind-hearted visitor.

"Willie, you've got to cut that out," admonished his somewhat exasperated mother.

Then she explained.

"He lost that nickel two years ago."

THE CARE OF MOLTING HENS

Written for California Cultivator
By Jean A. Koethen

THE molting hen is a tired hen. Her year's work, good or bad, is over, and she feels, I suppose, very much as several hundred thousand California parents and teachers and students will feel next week when all the agonies of commencement and "the last day of school" are over, and they are free to settle down to the peace and quiet of vacation. If a hen thinks, which of course all the wise folks say she doesn't, she must reflect when she sees the feathers dropping, "Thank goodness I don't have to lay an egg tomorrow or the next day or the next."

The key word to the care of molting hens is recuperation. We may prescribe protein or greens or shade or a reduced ration, according to her needs, but her needs must always be considered. The Plymouth Rock that has already reared a brood and gone back cheerfully to her laying needs treatment slightly different from that given the Leghorn that has laid two days out of three since November. The Leghorn needs rest and a diet that will restore her exhausted nerves and put, if possible, a little flesh on her bones. The Rock has had her rest and we need not worry if she postpones molting till late fall or molts and lays at the same time. If raising chicks in summer were not so troublesome I should like to set every hen that goes broody in June and July, and I do set as many as I can in August for the chicks they hatch come out in September when nobody wants a vacation. Nothing assures an easy molt like incubation, which is the most natural thing in the world to a hen. The long fast causes the feathers to drop quickly, the rest restores her wornout nerves (if a heavy hen really does have nerves) and the rich diet given the chicks brings out the new coat.

Perhaps it was the effect of fasting on the sitting hens which caused Henry Van Dresser to advocate the forced molt. If the incubating hen naturally molts early and begins to lay again in early fall why may not any other hen be made to do the same thing?

The theory is a beautiful one but it has rarely worked out in practice. Careful experiments at various agricultural colleges proved that while a forced molt did sometimes secure a few more eggs in the course of a year it sometimes injured the health of the hen and actually diminished her productivity, and it was rarely if ever really worth while. Professor James E. Rice of Cornell wrote while the forced molt craze was at its height: "The practice of forcing an early molt by a starvation process so that the fowls throw their feathers in a bunch is receiving wide publicity and trial. With what success time only will reveal." And time has revealed that like many other systems and fads it could not make good. It was against nature, that is all.

The natural molt of birds and fowls is an almost imperceptible one. The bird drops a few feathers at a time, and the new coat comes in as gradually as the old one is dropped. Many hens still molt in this way. Probably half of the hens in most flocks drop their feathers and replace them without showing the bare skin. I suspect the excessively ragged, sometimes nearly naked condition, of many is due to exhaustion from heavy laying. Cock birds rarely, if ever, lose their plumage in this way.

The first thing the molting hen requires is rest. Cut out the forcing mash as the time for molting approaches and feed good whole grain and plenty of green. If the hens can be turned out to range in orchard or fields where they can forage for part of their living they will be better off in every way. With the change in diet there will be a gradual letting up of production, but there will be no shock. The best layers in the flock may keep on laying in spite of the change in ration. If they do, let them lay. It is often said that the early molter is the indifferent layer. Whether or not this is true I am quite sure that the late molter is the best layer.

The second requirement of the molting hen is a diet to fit her condition. This means that all the birds should be examined and the overfat hens separated from the thin ones. The very fat hen will shed her feathers but will not have to renew her coat. The very poor one will not be able to shed her coat. This at least is what the books say. I have had a hen now and then that was so fat she could not renew her coat, but I have never seen one too thin to shed hers.

These overfat hens, if they are too valuable to be sent to market should be put by themselves and given a ration of grain and greens and feeds rich in protein, which will supply the materials for feather-making. Old process oil meal, wheat bran, meat meal and skim milk are all good feather-making foods. Where it is possible it is a good plan to reduce the flesh of the fat hens either by a restricted diet or by letting them run awhile before they are given the feather-making foods, but it is always a question whether it isn't better to market the overfat hens at the begining of summer and be done with them. I kept some splendid big fat hens last summer because I needed them for breeders. By January they weighed from seven to ten pounds apiece, but never an egg did I get. Their too-fatness made them absolutely worthless except for the table. With the Orpingtons it is pretty safe to let the fat hens go as soon as they stop laying in the summer. Their eggs will hardly pay for their keep another season. The year-old hens that have kept themselves thin by heavy laying may well be kept over.

These thin hens, which are the main support of the flock, need a food rich in oil, with a moderate amount of protein. Oats, sunflower seed and flaxseed are the best examples of such foods. Leghorns that are very thin may be given a little corn, but the heavy hens are best without it. A word as to oats, however. Heavy oats are one of the best poultry foods, but the very light oats we often get are not worth buying, except for sprouting. Rolled oats, if they could be bought cheaply, would be a splendid addition to the mash of molting hens, especially of those intended for breeders, but they are too expensive for any but the very finest birds.

What about the birds that molt out of season and those that molt twice in a year? My Buttercups began to drop their feathers in December last year and were quite ragged, even bare in spots, at Christmas. I thought they had molted earlier, but if they did, it was the very light molt which is only shown by the feathers on the ground. These Buttercups were hatched in September and October of the year before, and the molting time of fall pullets is always a little uncertain. Professor Rice says pullets completing their first year of laying will molt even in the dead of winter.

But there seem to be other reasons for an eccentric molt in this climate. A breeder whose birds were at the Riverside fair last October told me they all molted afterward, and she attributed this second molt to the excessive heat in the show tent. Pullets hatched in March are quite likely, if they are fed a forcing mash, to molt in the fall, and sometimes these March pullets have a very light molt in early fall and then a real molt in the winter. I had a case a couple of years ago and I laid it to heavy feeding. These pullets will not molt as a rule if they are not allowed to begin laying till November. It is the pullets that begin in August, lay one litter and then quit that are the offenders.

Krogh Pumps

Don't fail to see our big exhibit at the San Francisco Fair. Also bear in mind that Krogh Pumps are supplying all the water for the big fair. This must signify superiority.

IT IS GOOD TO BE ALIVE

It is good to be alive when the trees shine green,
And the steep red hills stand up against the sky;
Big sky, blue sky, with flying clouds between—
It is good to be alive and see the clouds drive by!

It is good to be alive when the strong winds blow,
The strong, sweet winds blowing straightly off the sea;
Great sea, green sea, with swinging ebb and flow—
It is good to be alive and see the waves run by.

—Charlotte Perkins Stetson.

THE OLD SQUIRE'S EDEN

(Concluded from last week)

The more we thought about it, the more certain we became that the motive of the thief, or thieves, had been to get complete possession of this valuable new kind of potato. Of course all our neighbors, and in fact many farmers in the vicinity, knew of the old squire's potato garden. The neighbors, however, were above suspicion. Indeed, they all helped us to try to get some trace of the rogues. But the thieves had apparently planned the theft with care; at any rate, they had left no track behind them.

We had never seen the old gentleman so downcast by a loss. He had experimented so long in the potato-ball garden, and was so proud of the fine new variety, that the thought that the Bobolinks had been stolen, just to boil for food, perhaps, grieved him to the heart! He could hardly bring himself to speak of it.

About a mile and a half from us lived a young farmer of not very good character, and we soon suspected that he was concerned in the theft. Addison heard that on the morning after our potatoes had been stolen, this man had been seen driving on the road with two barrels in his wagon; he told several people, however, that the barrels contained pears that he was carrying to Portland to peddle from house to house. There was little doubt that he knew about the old squire's experiments in the potato garden, and that he was aware of the value of the new variety; bue we could not get any proof against him. What he could have done with the potatoes we could not guess. He could not have planted them himself, or sold them for seed to any farmer in Maine, without our learning of it.

Two years passed. The loss distressed the old squire so much that he let his potato garden lapse, and seeded the patch down to clover.

Then at last in a Western agricultural paper some oi us read about a new variety of potatoes, called the Jim Crows, that were advertised for seed. According to the description their fine qualities were so much like those of the lost Bobolinks that the old squire wrote asking to have a little package of them sent to him by mail.

No potatoes came, and he wrote again, but got no reply. He wrote a third time, and at last received a letter saying that the stock of seed was exhausted. But for months afterward the advertisement continued to appear in the agricultural paper; that seemed so singular to us that we wrote to the postmaster of the town where the owner of the potatoes lived, and asked about his character and his standing as a citizen.

The postmaster's reply was peculiar, it neither vouched for the man's character nor alleged anything against him. In the same letter the postmaster remarked that there was, apparently, a large sale for the Jim Crow potatoes, and also that he had raised them one season himself, and would be very glad to send us a few of them. A day or two later he sent us a little package of four potatoes.

From the moment we opened that package neither the old squire nor any of the rest of us had the slightest doubt that the Jim Crows were our lost Bobolinks. They were like them in every particular.

Meanwhile another peculiar circumstance came to light. Through one of our hired men, who was a relative of the young farmer whom we had suspected, we learned that the fellow had an uncle living in the West, a farmer, of the same name as the owner of the so-called Jim Crow potatoes. Further inquiries proved that the uncle was indeed the man who had advertised the potato seeds.

Evidently the young farmer had stolen the old squire's Bobolinks and sent them West, where his uncle had rechristened them the Jim Crows. That he had made large profits from them was indicated by the fact that he had recently sold his small farm, purchased a larger one, and stocked it expensively.

We younger members of the family were for bringing action at once against the two rogues; but the old squire pointed out that we could never bring them to justice, for our case against them had a fatal defect. We could not produce in court a single specimen potato of the original Bobolinks that had been stolen. And a court of law could not take our unsupported word for it that—after two years—this Western seed potato was the same as ours that had been stolen so long before. And even if we could have proved it, the Western uncle would have declared that he had been secretly growing seed potatoes from the ball, and that he had hit on a variety similar to ours. So we had nothing to do except to let the case drop. Curiously enough, from the moment

NEXT WEEK

Owing to the index being published this week our prize contest recipes have been crowded out. They will be given next week. They are more than usually good and are well worth waiting for.

Delicious Brown Bread

A Simple Recipe Popular With Housewives All Over the Country

As an accompaniment to that dish so popular with the American public—"Boston Baked Beans"—brown bread is in almost as great demand. The making of good brown bread, therefore, should be one of the accomplishments of every efficient housewife. The next time you serve baked beans, try this little recipe for making the brown bread to go with them:

2½ cups yellow cornmeal; ½ cup Kingsford's Cornstarch; ½ cup flour; ½ cup rye meal; 1½ heaping teaspoons soda; 1 teaspoon salt; 1 cup Karo Syrup; 3½ cups sour milk. Sift the dry ingredients together till thoroughly mixed. Add the Karo and stir in the sour milk. Mix well and steam four hours.

The Karo Syrup referred to in this recipe, as well as the Kingsford's Cornstarch, can be obtained at all modern grocers. Satisfactory results cannot be promised if inferior ingredients are used. Karo Syrup is used by discriminating housekeepers and eminent chefs in all parts of the country—and you can safely be guided by their experience.

In ordering Karo Syrup, ask your grocer for the little Karo cook book containing hundreds of valuable recipes for making breads, biscuits, rolls, griddle cakes, waffles, cakes, cookies, candies and hundreds of other delicacies—one trial of which will make the family happy.

that the old squire became convinced that the Jim Crows and his lost Bobolinks were the same, he cheered up. He began to laugh over the whole affair.

"I was afraid some one had eaten them," he said. "That would have been a pity. But now they're spreading and doing good in the world—just as much perhaps as if I had sold them myself."

Addison was inclined to see the matter in a different light. "That money was yours, sir. You surely ought to have it!" he exclaimed.

"Of course, of course!" said the old squire, still smiling. "But, after all, the main thing for us to accomplish in life is to keep this old world of ours going ahead for the better."—Youth's Companion.

Enlarge Your Cooking Possibilities

By a Little Study on the Manifold Uses of Cornstarch

If cornstarch could be used for only one purpose—the making of a good pastry flour (by simply mixing with the regular bread flour in the right proportion)—it would be an invaluable aid to every housewife. However, this is only one of hundreds of ways in which cornstarch can be used to advantage by the efficient cook. In fact, no one can realize all the possibilities of good cooking without a thorough knowledge of this delicious and all-important food product.

Many kinds of bread, pastries, griddle cakes, waffles, fritters, cookies, icings, puddings, ice cream and dozens of other desserts will be made much more delicious by the use of cornstarch.

But in order to obtain the best results it is essential that the best quality of cornstarch be used. Ordinary cornstarch cannot be depended upon for the results you desire.

Correspondence with housekeepers in all parts of the country has developed the fact that those who have the most success with cornstarch recipes, invariably use the famous Kingsford's brand. Kingsford's Cornstarch can be obtained at all modern grocers. It costs no more than inferior kinds. Insist upon Kingsford's and ask your grocer for a copy of the little Kingsford's cook book containing hundreds of valuable recipes—many of which were contributed by eminent culinary experts in all parts of the country.

The End of The Ant Nuisance

No Need to Suffer Longer From This Pest

An old philosopher once said, "All these things shall pass away." It was a long, long time after this truth was given to the world, however, before a means was discovered to make ants pass away and stay away.

In the meantime thousands of women in all parts of the world have been driven almost to distraction by this intolerable household pest.

It remained for a mere man to find the remedy. A baker and candy-maker in Los Angeles, whose place was over-run with ants, had reached a point where he must either get rid of the ants or go out of business. After much experimenting he prepared a paste which drove every ant out of his shop in one day.

This wonderful remedy can now be had at all druggists under the name of Kellogg's Ant Paste. Try a package today, and you will never be annoyed with ants hereafter.

JULY PRIZE CONTEST

For outdoor lunches. A subscriber has asked for suggestions for picnic lunches, campfire parties, etc., for the vacation good times.

For best list of good things for outing lunch with one recipe the Cultivator will give $2.00; for second best, $1.00. All published will receive three months' subscription to the California Cultivator. If a member of your family is now subscribing send the name that subscription may be extended.

Those who have received one extension of subscription this year are not entitled to another. All may however compete for cash prizes.

Write Early

Write early. All letters should be in this office by the morning of July 15. Recipes will appear in issue of July 22.

Please write on one side of paper only. Address letters to California Cultivator, Los Angeles. Send only one suggestion, the one you yourself think the very best. So much splendid material was contributed for the June contest that we could not use for lack of space that our feelings were dreadfully hurt; we wanted to use it all and we wanted you all to see it all. Therefore we will ask you to do the selecting yourselves of the one best.

Send Suggestions

Any suggestions for future contests will be gladly receieved. The Cultivator wishes to give what its readers most need or are most interested in. The present issue's presentation of use of soda in baking was the result of a request from a subscriber, as is the subject of the July contest. Send in a subject for August.

"G" BEFORE "I."

It is not bewildered foreigners alone who fall into the traps for the unwary that our confusing grammar and orthography lay. Many a despairing American, with no natural aptitude for spelling, hesitates, or flies to the dictionary long after his student days are over, because, although he remembers the rule, he does not remember the exceptions.

"And in our rules of spelling," protested one unfortunate professor—not of orthography—"it isn't even a case of 'majority rules'; it's merely plurality. Sometimes, I'm sure, the minority of exceptions to a rule isn't beaten by the words that comply with it by more than one!"

A recent correspondent of the New York Sun recalls an illustrative incident of his school days. His teacher was self-satisfied and young, and thought he knew it all—but did not.

There was in the class a young lady who rejoiced in the good Scots name of Gillies. When the class was organizing, the "professor" read her name as "Jillies." The young lady protested, but in vain: "'G' before 'I' is soft!"

Well, of course an eighth of a quart is a jill, but what of a fish's gill? And the "know-it-all" teacher should have been hanged on a g(j)ibbet; but even he would not have asked the hardware man for a jimlet. Not in his jiddiest moment of pedagogic authority would he have said, "Jilbert, jive me a jilt-wheeled jig" if he wanted the liveryman to supply him a gig with gilded spokes for his holiday diversions. Not even he, snapshot arbiter of linguistic niceties, would have asked at the library for Jibbon's "Decline and Fall." And if he has a daughter will she be a jirl? But Gillies must be called Jillies, because "g" before "I" is soft.—The Youth's Companion.

From the Cocoa Bean to Chocolate

The entire process is shown in the Ghirardelli Building at the Exposition. The machinery used and the care necessary to produce the famous Ghirardelli Chocolate and Cocoa are fully explained.

Don't fail to drink a cup of Ghirardelli's Ground Chocolate—made as it should be made. This delightful food beverage is served day and evening.

Buy Telephones for Telephone Service

THERE is as much difference in telephones as in automobiles, and they should be bought as carefully. You want to use a phone giving reliable service. Cheaply made phones sometimes give good service for a week or a month; then trouble begins. Repair bills make cheap phones costly. Voices come over the wire faintly. Many sounds do not get over at all.

With a Kellogg Telephone repair bills amount to nothing. After years of use you can hear a watch many miles away tick loudly and clearly. They are so strongly and simply made that everywhere among users of telephones the name Kellogg has come to stand for ideal telephone service.

Kellogg Telephones Stand for Service

They are made in the largest independent telephone factory in the world. Every instrument passes 37 rigid tests before it is shipped. You have day by day the satisfaction of using a phone that makes telephoning a pleasure.

We have an expert department costing us $100,000 a year that is maintained for telephone users and those who are starting new lines. Why not put your problems before these experts? The service costs you nothing. You cannot fail to get information that will save you time, money and trouble.

Get your name on our books to receive valuable bulletins and other telephone literature that we send free.

A New Oakland Six

As we see it this is a time for straight from the shoulder talk about a car that won't be duplicated this season in the whole motor industry. We don't believe in these headlines that read "epoch making" and "marking a new era in the motor industry." Just give them the actual facts. They're strong enough to rivet the attention of every man who thinks of buying a car this year. And the public wants facts more than it wants fine language. Give 'em the facts and leave it to their own logical minds to arrive at a sensible conclusion.

The Manufacturer's Directions to the Advertising Agency

$795

The quickest and surest way to have you realize the bigness of this announcement is to give you the plain facts about this car.

First—it's an Oakland in every respect. That means it is a *real* car in *every* respect. It's a Six. And it sells for $795.

Light in weight, built low to the ground, yet with usual clearance, trim and stately, and with *room in it*—plenty of room for five. *Upholstered in genuine machine-buffed leather.*

Safety, Speed, Stamina and, above all, the name, *Oakland.* Oakland Quality, Oakland Economy, Oakland Built.

Value that means Volume
Volume that means Low Price

But the specifications tell the story. They're the most appealing arguments we can give you.

Specifications— Six-cylinder Oakland-Northway 30 to 35 horse power motor. —110-inch wheel base. —Body accommodates five passengers *comfortably*. —Upholstered in genuine machine-buffed leather. —Rear seat 46 inches wide. —Weight 2100 pounds. —Electric starting, lighting and ignition system. —Oakland-Stewart Vacuum Feed. —One man top, crown fenders, extra rim, speedometer, etc. —Complete equipment.

Full description and specifications mailed on request.
